# Effect of statistical analysis parameters: Definitions

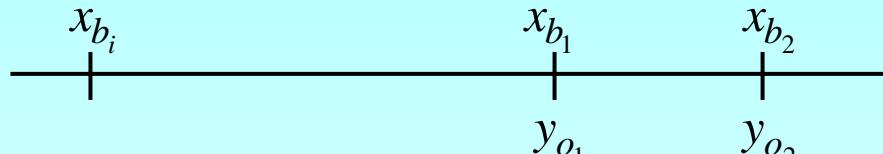

- Optimal interpolation:

$$\mathbf{x}_a = \mathbf{x}_b + \mathbf{B}\mathbf{H}^T(\mathbf{H}\mathbf{B}\mathbf{H}^T + \mathbf{R})^{-1}(\mathbf{y}_o - \mathbf{H}\mathbf{x}_b)$$

$$\mathbf{B}_{ij} = \sigma_b^2 \mu_{b_{ij}} \quad \mu_{b_{ij}} = (1 + r_{b_{ij}} / L_b) \exp(-r_{b_{ij}} / L_b)$$

$$\mathbf{R}_{ij} = \sigma_y^2 \mu_{y_{ij}} \quad \mu_{y_{ij}} = (1 + r_{y_{ij}} / L_y) \exp(-r_{y_{ij}} / L_y)$$

$\mathbf{H}$  is a simple interpolation operator

$$x_{a_i} = x_{b_i} + W[\mu_{b_{i1}}((y_{o_1} - x_{b_1}) - C(y_{o_2} - x_{b_2})) + \mu_{b_{i2}}((y_{o_2} - x_{b_2}) - C(y_{o_1} - x_{b_1}))]$$

$$C = \frac{(\sigma_b^2 \mu_{b_{12}} + \sigma_y^2 \mu_{y_{12}})}{(\sigma_b^2 + \sigma_y^2)} \quad W = \frac{\sigma_b^2}{\sigma_b^2 + \sigma_y^2} (1 - C^2)^{-1}$$

# Effect of statistical analysis parameters: Example

- ANALYSIS\_2OBS

Constructs 1-D analysis from 2 idealised obs with specified values and error characteristics

You may change the analysis parameters at the prompt, or press ENTER to retain previous values

- Current value o1 of ob#1      1.00000
- New o1 (between -2 and +2):
- Current position x1 of ob#1      4.00000
- New x1 (between 0 and 10):
- Current value o2 of ob#2      -1.00000
- New o2 (between -2 and +2):
- Current position x2 of ob#2      6.00000
- New x2 (between 0 and 10):

# Effect of statistical analysis parameters: Example

- Observation error  $\sigma_y$  (used for both obs) 1.00000

- New  $\sigma_y$ :

The observation error correlation depends on the distance between obs

- Current observation error correlation length  $L_y$ : 0.00000

- New  $L_y$  (put  $L_y = 0.0$  for uncorrelated errors):

- Background error  $\sigma_b$  (constant) 1.00000

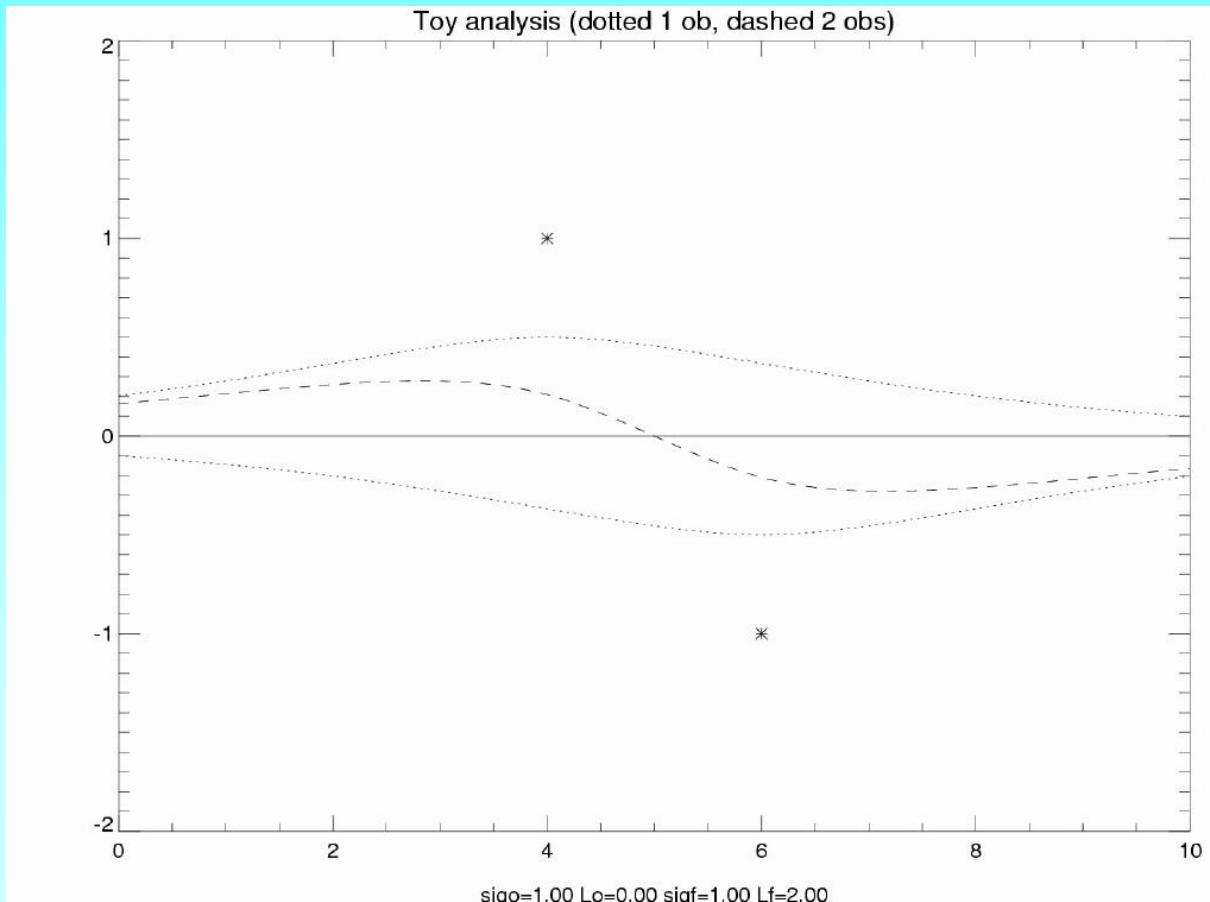

- New  $\sigma_b$ :

- Background error correlation length  $L_b$  2.00000

- New  $L_b$  (put  $L_b = 0.0$  for uncorrelated errors):

# Effect of statistical analysis parameters: Example

# Effect of statistical analysis parameters: Example

- ANALYSIS\_MOBS

Constructs 1-D analysis from multiple idealised obs with specified values and error characteristics

- In this programme, we use two different ob types (A and B).
- The number of obs of each type should be in range 0 to 7.
- Press ENTER to retain previous values
- You may specify two separate observation types (A and B)
- Different observation types have different error characteristics

# Effect of statistical analysis parameters: Example

- TYPE-A OBSERVATIONS
- Number of type A obs, noa: 3
- New noa (up to 7; 0 if none):
- Current type A ob locations 5.00000 4.00000 6.00000
- Current type A ob values 1.00000 1.00000 1.00000
- Do you want to change them (y or n)? n
- New type-A ob locations 5.00000 4.00000 6.00000
- New type-A ob values 1.00000 1.00000 1.00000
- Observation error for type A,  $\sigma_{yA}$ : 2.00000
- Observation error correlation length  $L_{yA}$ : 0.00000

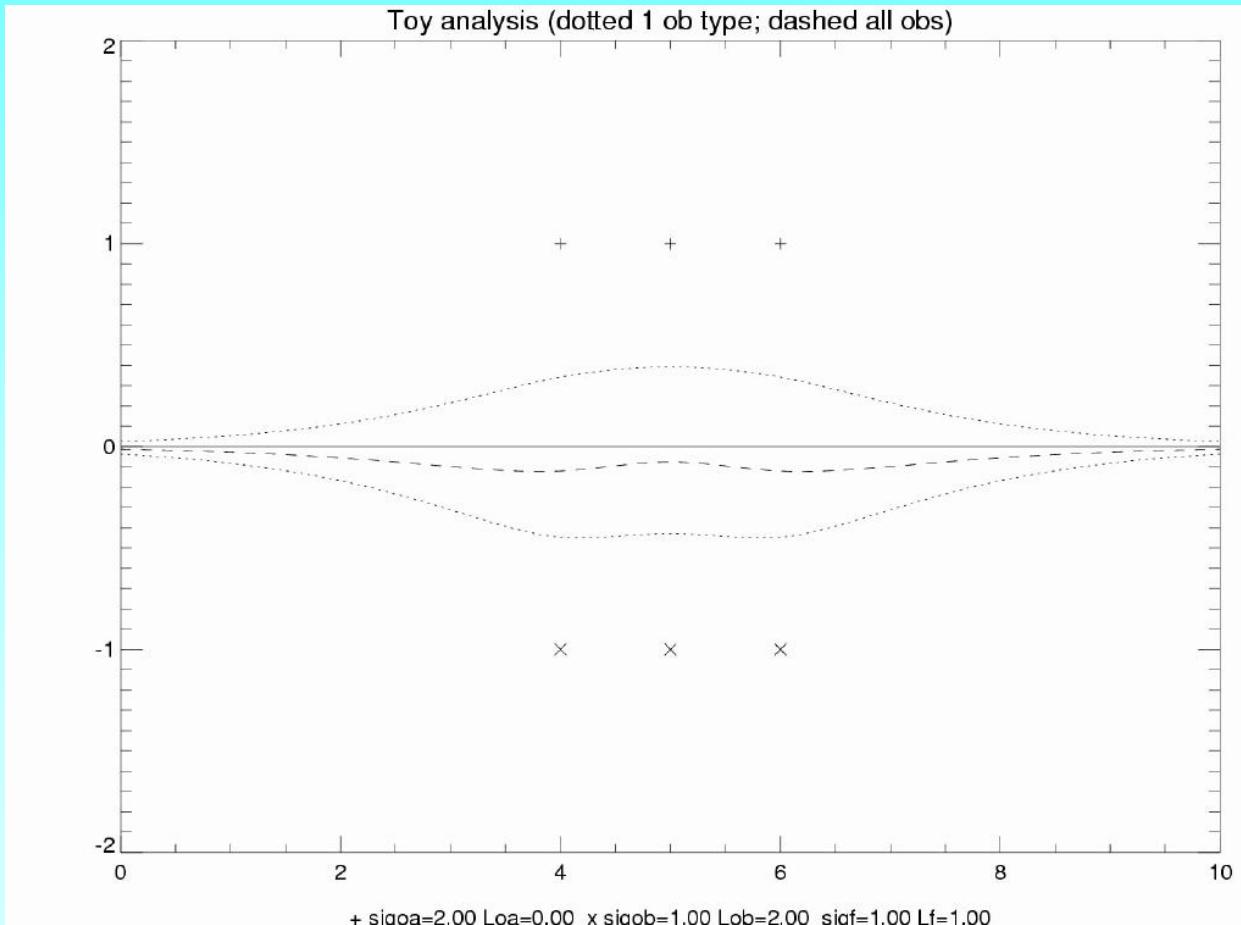

# Effect of statistical analysis parameters: Example

- TYPE-B OBSERVATIONS
- Number of type B obs, nob: 3
- New nob (up to 7; 0 if none):
- Current type-B ob locations 5.00000 6.00000 4.00000
- Current type-B ob values -1.00000 -1.00000 -1.00000
- Do you want to change them (y or n)? n
- New type-B ob locations 5.00000 6.00000 4.00000
- New type-B ob values -1.00000 -1.00000 -1.00000
- Observation error for type B,  $\sigma_{yB}$  1.00000
- Observation error correlation length  $L_{yB}$  2.00000
- BACKGROUND ("FORECAST") ERROR STATISTICS
- Background error  $\sigma_b$  (constant) 1.00000

# Effect of statistical analysis parameters: Example

# Effect of statistical analysis parameters: Example

- ANALYSIS\_SIM - Toy Analysis System
- Constructs 1-D analysis from simulated truth, forecast and observations with specified values and error characteristics
- You may change parameters, or just press ENTER to keep existing values
- The truth field is one of the following:
  - 0 - zero everywhere
  - 1 - pseudo step function
  - 2 - sum of several sinusoidal curves
  - 3 - statistically generated
- Current truth type: 0

# Effect of statistical analysis parameters: Example

- BACKGROUND FIELD
- You may use a background field that is shifted relative to the "truth"
- OR a background equal to truth + random perturbation
- Current amount of background shift (positive on left):  
**0.00000**
- New shift:
- Current background error,  $\sigma_b$ :      **2.00000**
- New  $\sigma_b$ :
- Background error correlation length  $L_y$       **2.00000**
- New  $L_y$  (put  $L_y = 0.0$  for uncorrelated errors):

# Effect of statistical analysis parameters: Example

- **OBSERVATIONS**
- Number of obs, no: 5
- New no (up to 11):
- Current ob locations 5.00000 6.00000 4.00000  
7.00000 3.00000
- Do you want to change them (y or n)? n
- Current observation error,  $\sigma_y$ : 1.00000
- New  $\sigma_y$ :
- Observation error correlation length  $L_y$ : 0.00000
- New  $L_y$  (0.0 for uncorrelated errors):

# Effect of statistical analysis parameters: Example
