

# Iceberg monitoring service by joint use of drift model, SAR and altimeter data

N. Longépé, F. Mercier, J.Y Lebras, M. Sutton, G. Hajduch

Collecte Localisation Satellites (CLS)

SeaSAR, Tromso, June 21, 2012

## Iceberg monitoring service

0

- An 24/7 Iceberg detection service delivered during
  - the Vendee Globe Challenge (2008-2009)
     a sailing race around the world, for single-handed, without any stopover

- the Jules Verne Trophy (2010) record attempt with Groupama 3 skippered by Franck Cammas
- the solo round the word (2011) of Sodebo skippered by Thomas Coville
- Service included
  - Preliminary iceberg detection by altimeter
  - Iceberg detection using SAR imagery
  - Iceberg drift forecast
- Further scientific/technical development
  - SIDARUS FP7 project
  - CITEPH program

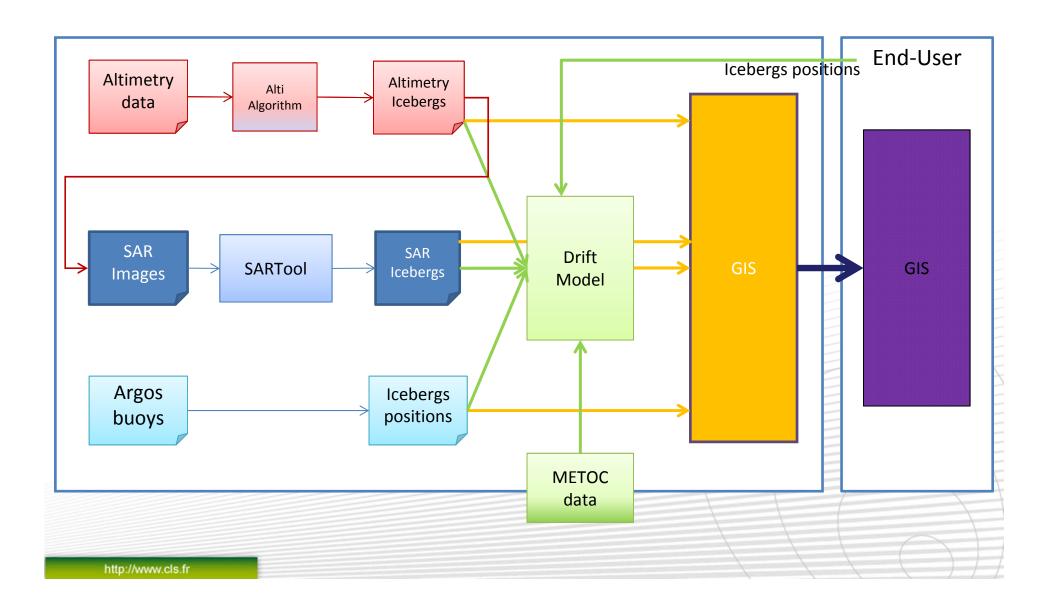

(sponsored by GEP - Total oil company, Doris, CGG Veritas ...)

### Spaceborne altimeter

35-day coverage of EnviSat

10-day coverage of EnviSat

3-day coverage of EnviSat

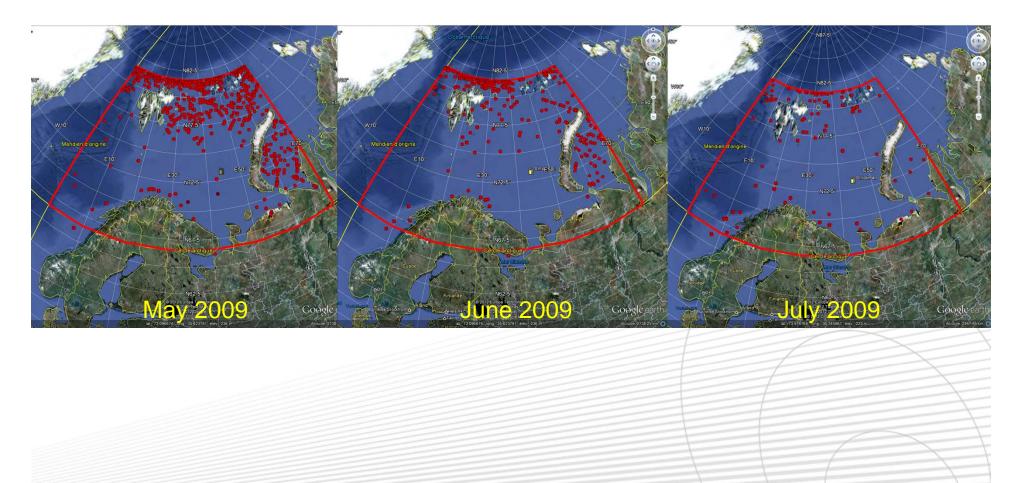

- Area illuminated by the radar
  - 10-20 km on each side of the track
- Area that actively contribute to the leading edge of the waveform (beginning of the peak)
  - Not more than 5 km on each side of the track (depending on the sea state condition) useful for iceberg detection

## Altimeter-based iceberg detection

• Cumulative approach over one month

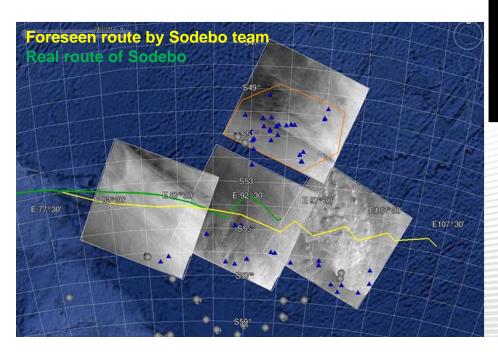

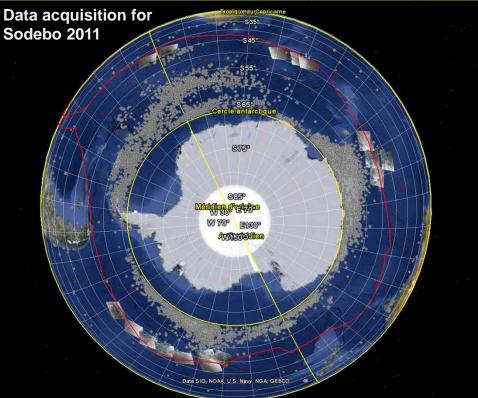

Toward an efficient data acquisition strategy with altimeter detection

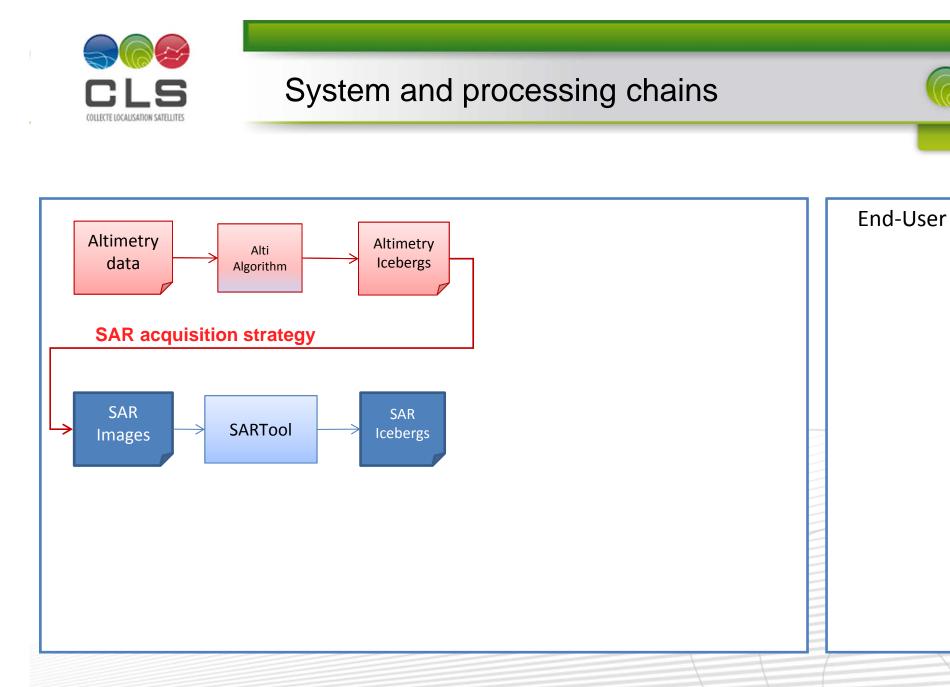

2008-2009: During Vendée Globe Challenge, **250 ENVISAT SAR** images were used to monitor icebergs: Very efficient but the market is not ready today for such a high volume of SAR acquisitions

**2010 Jules Verne Trophy : 30 RS2 SAR** scenes were programmed in short notice over pre-identified risky areas.

- Use of altimetry allows more efficient planning of SAR acquisition over risky areas
  - Risky areas can be identified and tracked well before the passage of the sailboat

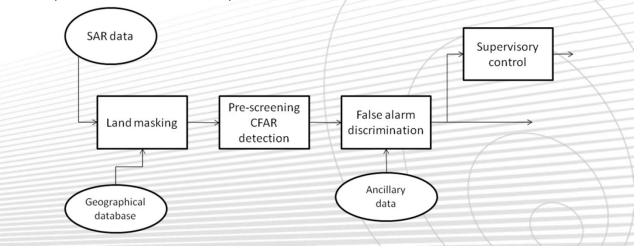

#### SAR-based iceberg detection

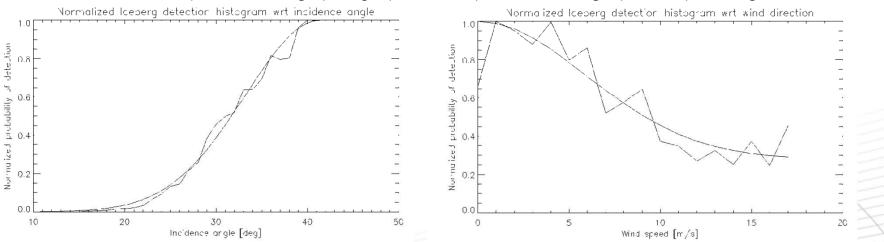

Imaging	Possible detection	Comments
mechanism	methods	
Double-bounce scattering	CFAR-like approach	Commonly used method,
		robust, good capacities
		except at steep angle or
		strong wind condition
Shadowing, Specular	Dark point-target detection	Observable with
reflection		decametric resolution only
Effect of surrounding sea	Segmentation, Hough	Strongly depend on sea
surface, Wakes	transform	condition
Shape	Image segmentation	Large icebergs only
Volume scattering	Multifrequency or	Observable only with multi
	polarimetric approach	channel data, for sea
		surface only

- Over 218 ASAR WSM in HH channel from Vendée Globe 2008-2009 dataset
  - No ground truth but a systematic detection approach
  - Occurrences of detection wrt incidence angle, wind speed
  - Valid for WSM products only (150m resolution 75 m pix. spacing).
    - medium (61-122m length), large (123-213m) and extra-large (> 213m) icebergs

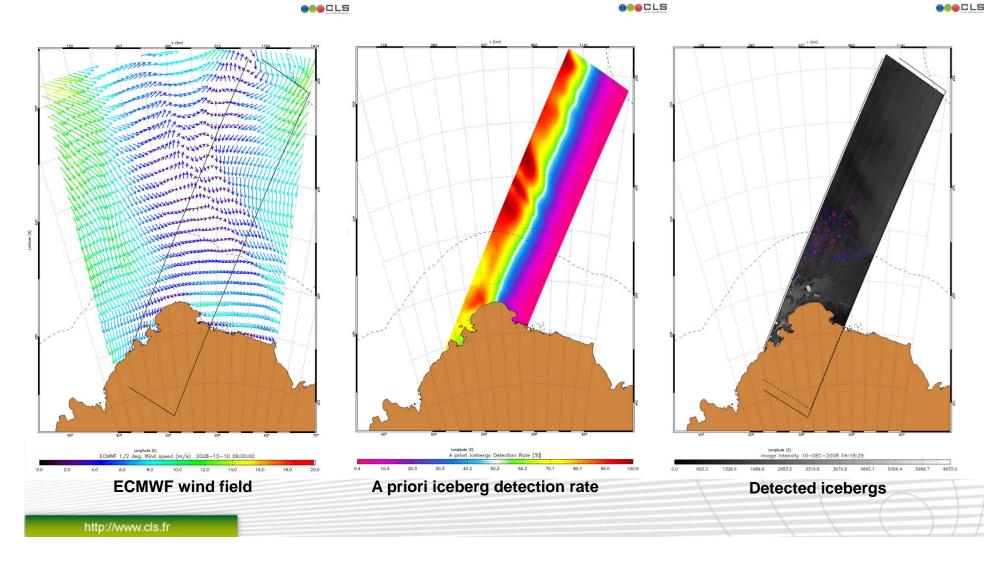

- Incidence angle appears as a critical parameter.
  - Below 30°, the detection rate is particularly low
- CFAR algorithm: based on the supposedly high contrast between the iceberg and the ocean clutter
  - Increase of ocean backscattering (linked to incidence angle or wind speed) -> diminution of the overall detection accuracy.

#### SAR-based iceberg detection

- Modeling of detection performance
  - Given incidence angle and wind speed (by ancillary data) -> a priori probability of detection

### MOBIDRIFT

**MOBIDRIFT** 

Iceberg modeling with

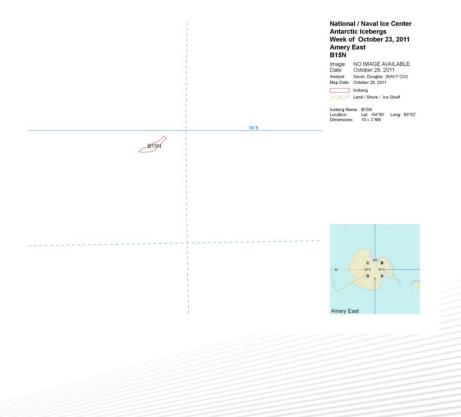

- advection
- thawing
- rolling over
- dislocation
- icebergs generation

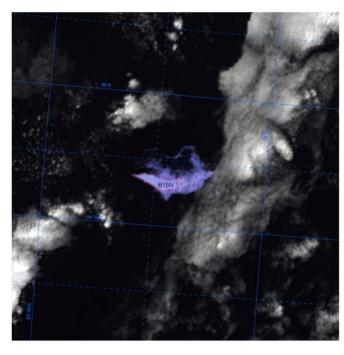

# Example of Drift modelling and validation with B15N

National / Naval Ice Center Antarctic Icebergs Week of November 6, 2011 Wilkesland West B15N

Image: MODIS Date: November 9, 2011 Analyst: King, Robert AG2 Map Date: November 10, 2011 Ceberg Land / Shore / Ice Shelf

 Iceberg Name:
 B15N

 Location:
 Lat: -53\*46'
 Long: 94\*40'

 Dimensions:
 7 x 2 NM

B15N: Drift simulation from Oct., 28 and until Nov. 9, 201

- Development of a complete prototype for iceberg detection and forecast
  - Use of altimetry: more efficient planning of SAR acquisition over risky areas
  - SAR data enable a reliable and well-controlled iceberg detection
  - Drift model for an Early Warning System
- Technical/scientific challenges
  - Complete integration of various data types (SAR, altimeter and metoc data)
  - Ensure a low false alarm rate with altimetry (waveform analysis)
  - Ensure a good SAR-based detection rate even in the icepack
    - Integration of SAR-based sea ice map -> toward an automated methodology ?
    - Tune the CFAR-based method ?
- Future demonstrations
  - the Vendee Globe Challenge (2012-2013)
  - An Early Warning System for oil platform, ongoing prototype demonstration for the Shtokman gas field in the Barents Sea
