- **NEST Features**

What is NEST

- NEST = **N**ext **E**SA **S**AR **T**oolbox
- A **free** and **fully open source** toolbox under the GNU GPL license
- Supports the scientific exploitation (reading, processing, analysing and visualising) of ESA and 3rd party *spaceborne* SAR data
- Development started in 2008
- Current stable version is 4C-1.1
- 5.0.9 beta (used in the LTC Course) by July 2013

NEST is being developed under ESA Contract number 20698/07/I-LG

NEST Development Team

NEST is being developed under ESA Contract number 20698/07/I-LG

NEST TEAM

1. ESA

Marcus Engdahl (ESA Technical Officer), Andrea Minchella (RSAC c/o ESA)

2. Array Systems Computing (prime)

Rajesh Jha, Luis Veci, Jun Lu, Shengli Dai

3. Brockmann Consult

Norman Fomferra, Marco Peters

4. PPO.labs (InSAR)

Petar Marinkovic

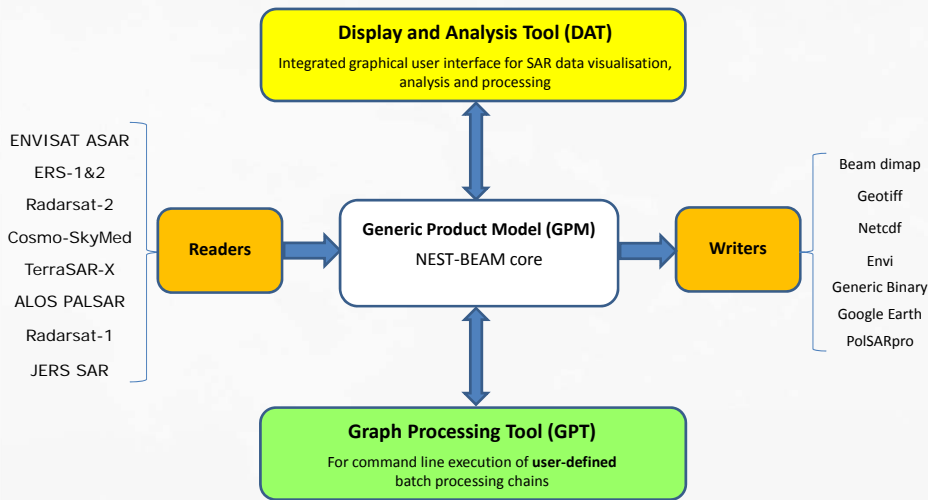

5. TU Delft (InSAR)

Prof. Ramon Hanssen

NEST Architecture

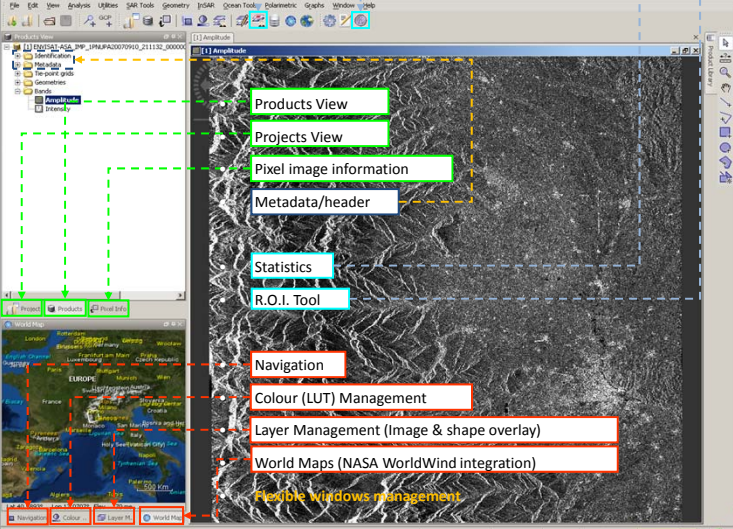

- NEST is built re-using the **proven** BEAM Earth Observation Toolbox and Development Platform (<http://www.brockmann-consult.de/cms/web/beam/welcome>)
 - Reduced development cost
 - Development synergy – thanks to the **shared NEST-BEAM Core** plug-in **modules** for both toolboxes are largely interchangeable.
 - Easy expandability (*BEAM processors*, etc.)
- **Java** implementation: guarantees **platform independence** and **easy portability** (Windows, Linux, Mac)
- Advanced features include:
 - A **“Tiled”** memory model
 - **Multi-core** processor support
 - Modular design (plugins)

NEST Architecture: data flow

HAROKOPIO UNIVERSITY  

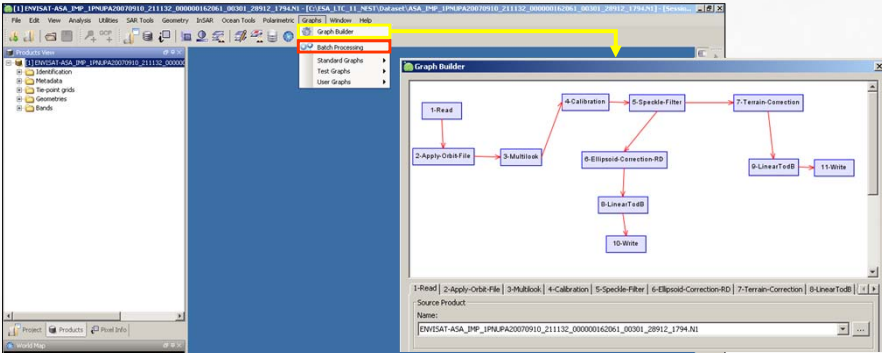

Display and Analysis Tool (DAT)

HAROKOPIO UNIVERSITY  

Graph Processing Tools

- Create your own processing chains & save in XML
- Visual Graph Processing Framework interface
- Executed from command line or from GUI
- Allows for *batch processing* on stack of images
- Very useful for large-scale processing

→ 4th
1-5 July 2013 | Harokopio University | Athens, Greece

NEST Features

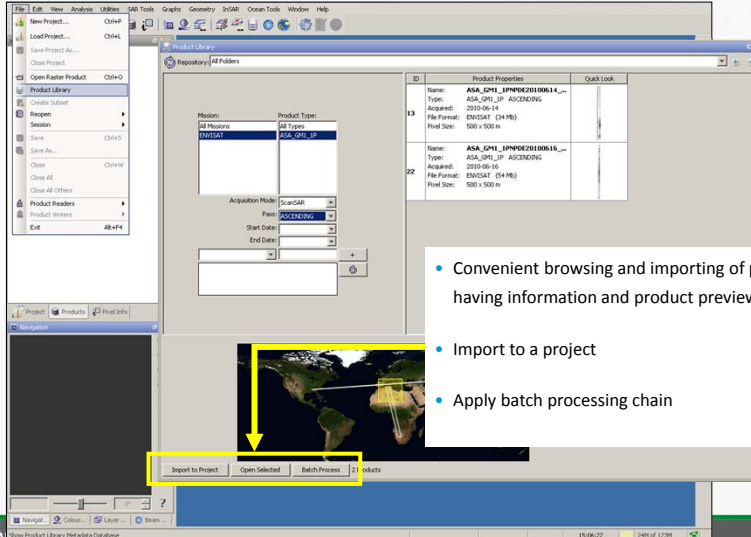

- Readers and Product library
- Utilities
- (Basic) SAR Tools
- (Advanced) SAR Tools: Geometry, InSAR, Ocean

Readers

SAR data readers	Common EO formats	Compatibility with other software
ENVISAT ASAR	GeoTiff	Envi
ERS-1&2	HDF 4 & 5	PoSARpro
ALOS PALSAR	NetCDF	BEAM
Radarsat-1&2	Generic Binary	
TerraSAR-X		
Cosmo-SkyMed		
JERS SAR		

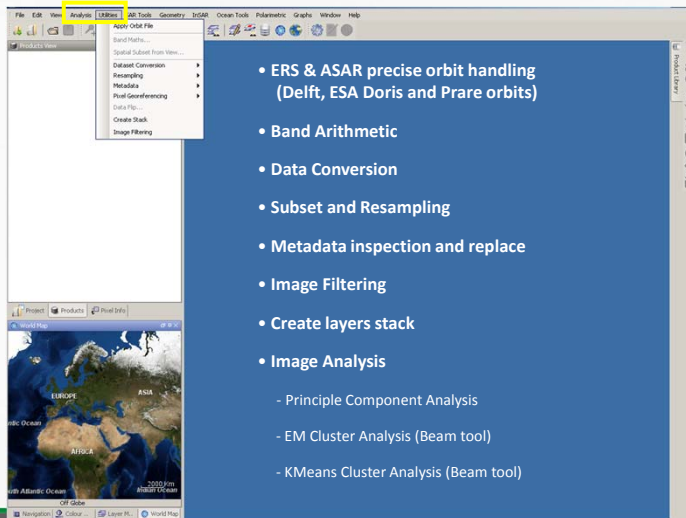

The Product Library

- Convenient browsing and importing of products having information and product previews.
- Import to a project
- Apply batch processing chain

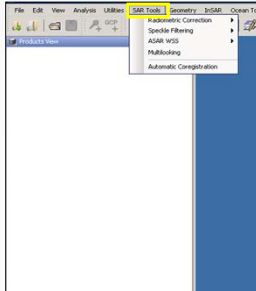

Utilities

(Basic) SAR Tools

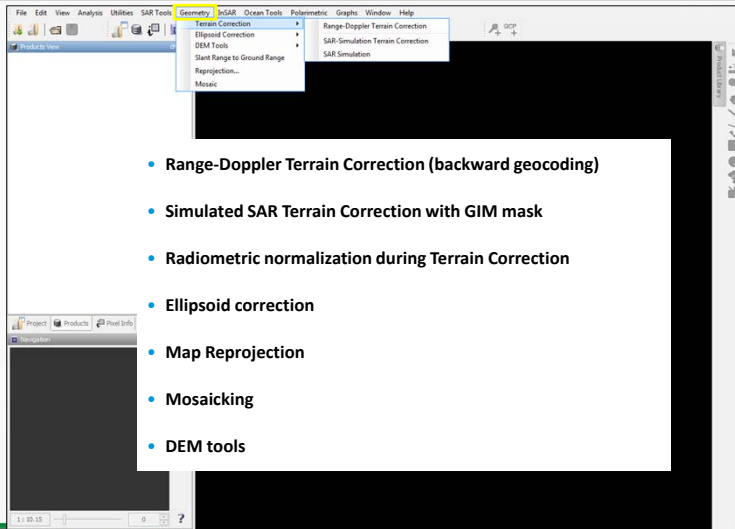

- Absolute calibration (Envisat ASAR, ERS 1&2, ALOS (not polarimetric), Radarsat-2, TerraSAR-X, Cosmo-SkyMed)
- Coregistration of detected and complex products
- Multilooking
- Speckle filtering (single and multitemporal filtering)
- Debursting of ASAR WSS

* Level of support depends on sensor & product type. Please refer to NEST documentation for full details available in the Documentation page on NEST website

- Operators help
- Supported Products vs Main Tools table

(Advanced) SAR Tools: Geometry

- Range-Doppler Terrain Correction (backward geocoding)
- Simulated SAR Terrain Correction with GIM mask
- Radiometric normalization during Terrain Correction
- Ellipsoid correction
- Map Reprojection
- Mosaicking
- DEM tools

(Advanced) SAR Tools: Geometry

$$\sigma_{NORLIM}^0 = \sigma_E^0 \cdot \frac{\sin \theta}{\sin \theta_m}$$

Mission	Range Doppler TC/SAR Simulation TC	Radiometric Normalization (Approach: Kel'ndorfer et al., TGRS, Sept. 1998)
ASAR	Both complex and detected products supported	Both complex and detected products supported
ERS	Both complex and detected products supported	Both complex and detected products supported
RADARSAT-2	Both complex and detected products supported	Both complex and detected products supported
Cosmo-SkyMed	Both complex and detected products supported	Both complex and detected products supported
TerraSAR-X	Both complex and detected products supported	Both complex and detected products supported

Mosaic

62 ASAR GM Products Mosaic of Australia

Ocean Tools

- Object (ship) Detection
- Oil Spill Detection
- Wind Field Estimation
- Create Land Mask

Map Projected

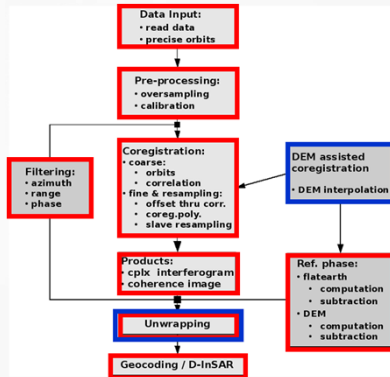

InSAR functionality of NEST

The InSAR functionality of NEST is structured in two layers:

- The core layer is formed by **JLinda** (Java Library for interferometric data analysis) which is a standalone API/InSAR library, independent from the NEST/BEAM core, encapsulating the classes, functionalities and algorithms for the interferometric processing.
- The NEST InSAR operators are built on top of core classes from JLinda package by using the NEST/BEAM Graph Processing Framework (GPF) and libraries.

InSAR functionality of NEST

Fully integrated and featured InSAR processor within NEST

- Coregistration and resampling
- DEM assisted coregistration
- Products: interferogram and coherence
- Filtering: both spectral and phase
- Geo-coding
- Unwrapping
- DEM product
- Differential InSAR
- Cross InSAR (ERS-ENVISAT)

- Available in 509 beta
Unwrapping via 3rd party sw (SNAPHU)
- Available in 5A

Only zero doppler and strip map data are fully supported

What's new in NEST 509 respect to 4C-1.1

- Autoupdate installation
- **New abstraction for left/right facing missions**
- **Rigorous TerraSAR-X calibration**
- **TC of TerraSAR-X detected products**
- Copy, move, delete from product library
- Graphical subset selection
- Mapping tools layers
- Mosaic several bands at once to create RGB mosaics
- Import vector operator
- Flip operator
- **Update to ENVISAT reader for ASAR 4/C specification**
- Fix for GeoTIFF projection issue
- **Code refactoring for performance improving**
- Bugs fixes

Further information
