

MULTITEMPORAL IMAGE ANALYSIS: PRACTICAL LECTURE

Lorenzo Bruzzone

E-mail: lorenzo.bruzzone@ing.unitn.it

Web page: <http://rslab.disi.unitn.it>

1–5 July 2013 | Harokopio University | Athens, Greece

Outline

- 1 Processing Chain for Change Detection
- 2 Change Vector Analysis (CVA)
 - ✓ Effects of Radiometric Differences
 - ✓ Effect of Residual Misregistration
 - ✓ Detection of Multiple Changes
- 3 Compressed Change Vector Analysis (C²VA)
 - ✓ Effects of Radiometric Differences
 - ✓ Effect of Residual Misregistration
 - ✓ Detection of Multiple Changes
 - ✓ Analysis of Direction Ambiguity

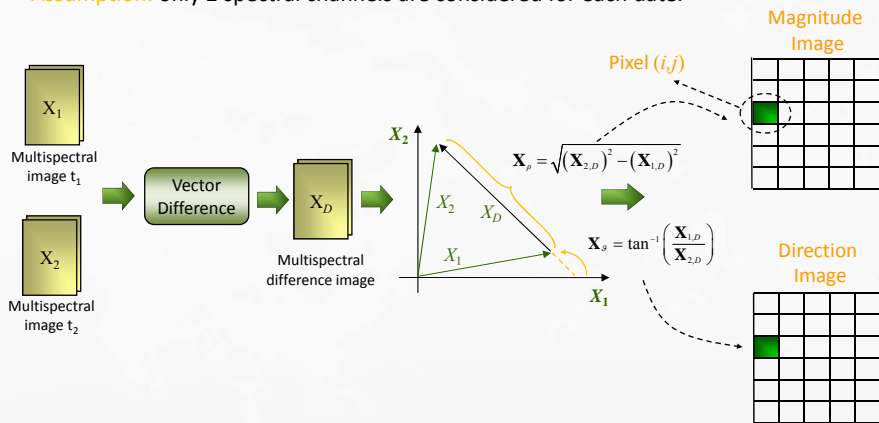

Processing Chain for Change Detection

Change Vector Analysis (CVA)

Assumption: only 2 spectral channels are considered for each date.

UNIVERSITY OF TRENTO - Italy  www.rslab.disi.unite.it
lorenzo.bruzzone@ing.unite.it

- ✓ Select image at time t_1 ;
- ✓ Select image at time t_2 ;
- ✓ Select the desired pre-processing steps;
- ✓ Select CVA option;
- ✓ Select the spectral channels to highlight the changes;

Press "Calculate" to :

- ✓ Perform pre-processing (if any);
- ✓ Compute magnitude and direction;
- ✓ Visualize polar representation.

CVA

Control Point Selection Tool 1

File Edit View Tools Window Help

Close Control Point Selection Tool Ctrl+W

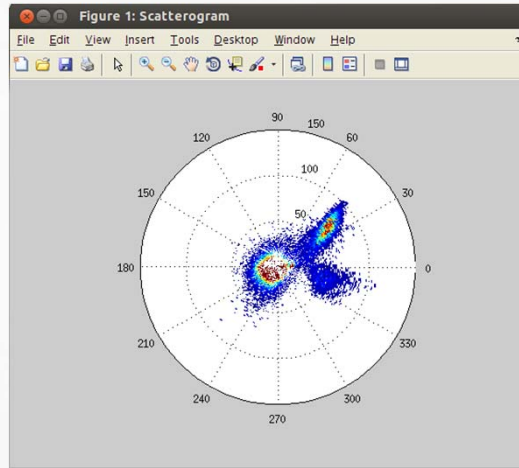

- ✓ If "Coregistration" check box is selected, coregistration form appears;
- ✓ Select Ground Control points (at least 4);
- ✓ Co-registration is performed by means of bilinear interpolation.
- ✓ Once finished select File -> Close Control Point Selection Tool

CVA

Polar plot example

CVA

Select threshold for the magnitude variable:

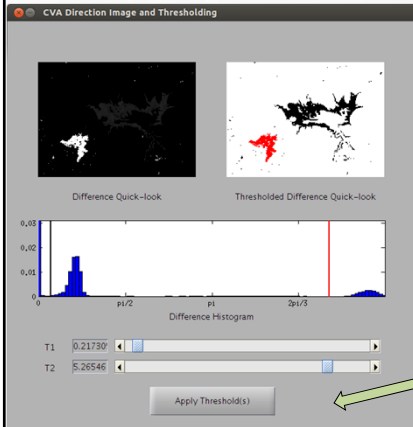

- ✓ Perform automatic threshold selection (press **“Compute automatic threshold”** and wait some seconds);
- ✓ Manual threshold selection moving the **red line** on the histogram or **cursor** on the T scroll;
- ✓ Use zoom to better detect the threshold.

Press **“Apply threshold”** to :

- ✓ Threshold the magnitude;
- ✓ Move to direction analysis.

Select whether presence/absence of change information should be used in the analysis of direction information.

CVA

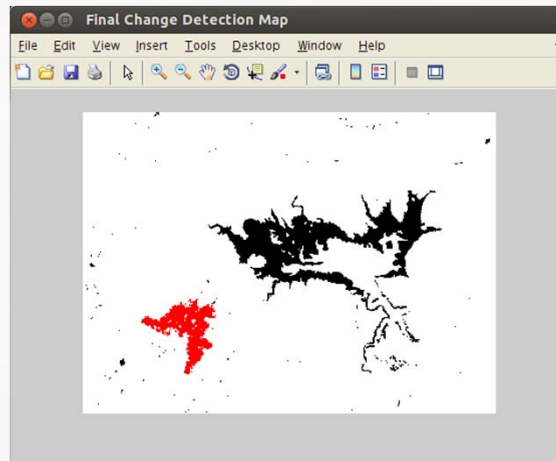

Select threshold(s) for the direction variable:

- ✓ Manual threshold selection moving the red and black lines on the histogram.
- ✓ Or moving the cursors on the T_1 and T_2 scrolls;
- ✓ Use zoom option to better detect the threshold(s).

Press "Apply threshold(s)" to :

- ✓ Threshold the direction;
- ✓ Visualize the final change detection map.

CVA

Change detection map example

CVA: Outputs & Notes

Outputs:

- ✓ Multispectral difference image;
- ✓ Magnitude image;
- ✓ Direction image;
- ✓ Thresholded magnitude image;
- ✓ Thresholded direction image;
- ✓ Change detection map;
- ✓ Polar plot;

Notes:

- ✓ All outputs are saved in "Output" folder.
- ✓ Images are saved as a data file plus header format and can be loaded either in Matlab or ENVI environment.
- ✓ Each run overwrites output files, if you don't want to lose them rename the files.
- ✓ Polar plot is saved in Matlab .fig format.

CVA: Suggested Tests

Perform trials in order to analyze:

- ✓ The effect of using images with radiometric differences;
- ✓ The effect of using images with a significant amount of residual misregistration;
- ✓ The effect of using different combinations of spectral channels.
- ✓ The effect of the presence of multiple changes.

Tip: instead of thresholding, manually draw regions on the polar plot to isolate specific clusters of pixels.

CVA: Example and Discussion of Results

Study area: Lake Mulargia, Sardinia Island (Italy).

Multitemporal data set: a portion of 412×300 pixels of two images acquired by the TM sensor of Landsat-5 satellite in September 1995 and July 1996.

CVA: Example and Discussion of Results

Corrected Images (Ideal case)

Optimal threshold value on the magnitude variable: ideal case

Registration noise effects

Registration noise effects

Radiometric difference effects

Threshold value on the magnitude variable: radiometric distortion case

F. Bovolo, L. Bruzzone, A Theoretical Framework for Unsupervised Change Detection Based on Change Vector Analysis in Polar Domain, *IEEE Transactions on Geoscience and Remote Sensing*, Vol. 45, No.1, 2007, pp.218-236.

Compressed Change Vector Analysis (C²VA)

- ✓ CVA in 2 dimensions permits to easily visualize the change information in polar coordinates, but may results in the loss of information due to spectral channel selection.
- ✓ CVA may be applied on $B > 2$ spectral channels in hyperspherical coordinates. However, when B is greater than 3 it is impossible to visualize the data in the polar domain.
- ✓ Compressed CVA (C²VA) can overcome the abovementioned limit of polar CVA.

Compressed Change Vector Analysis (C²VA)

Magnitude: the length of the multispectral difference vector (X_D).

$$X_\rho = \sqrt{\sum_{b=1}^B X_{b,D}^2} = \sqrt{\sum_{b=1}^B (X_{b,2} - X_{b,1})^2}$$

bth spectral band of X_1

Direction: the angle between the multispectral difference vector (X_D) and a reference vector (X_{ref}) in a BD space.

$$X_\alpha = \arccos \left(\frac{\sum_{b=1}^B (X_{b,D} X_{b,ref})}{\sqrt{\sum_{b=1}^B X_{b,D}^2 \sum_{b=1}^B X_{b,ref}^2}} \right)$$

$\alpha \in [0, \pi]$

BD unit vector
 $X_{ref} = \left[\frac{\sqrt{B}}{B}, \dots, \frac{\sqrt{B}}{B} \right]$

Compressed Change Vector Analysis (C²VA)

Definitions

1. Compressed CVA (C²VA) Domain

$$C^2VA = \{\rho, \alpha : 0 \leq \rho < \rho_{max} \text{ and } 0 \leq \alpha < \pi\}$$

$$\rho_{max} = \max \left\{ \sqrt{\sum_{b=1}^B X_{b,D}^2} \right\}$$

α -> Random variable associate to direction image X_α

2. Semi-Circle of unchanged pixels

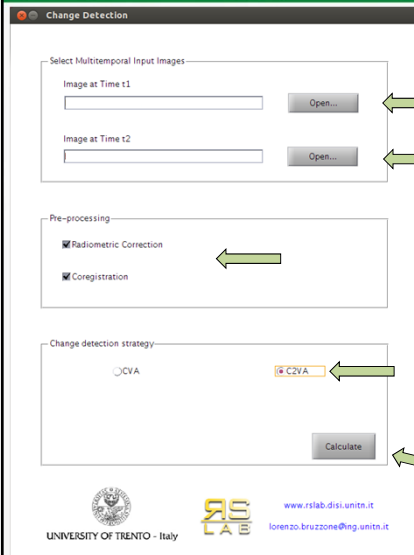

$$SC_n = \{\rho, \alpha : 0 \leq \rho < T \text{ and } 0 \leq \alpha < \pi\}$$

3. Semi-Annulus of changed pixels

$$SA_c = \{\rho, \alpha : T \leq \rho \leq \rho_{max} \text{ and } 0 \leq \alpha < \pi\}$$

4. Annular sector of the k-th kind of change

$$S_k = \{\rho, \alpha : \rho \geq T \text{ and } \alpha_{k1} \leq \alpha < \alpha_{k2}, 0 \leq \alpha_{k1} < \alpha_{k2} < \pi\}$$

C²VA

✓ Select image at time t_1 ;

✓ Select image at time t_2 ;

✓ Select the desired pre-processing steps;

✓ Select C²VA option;

Press "Calculate"
and follow the similar steps described
for CVA option.

C²VA: Suggested Tests

Preform trials in order to analyze:

- ✓ The effect of using images with radiometric differences;
- ✓ The effect of using images with a significant amount of residual misregistration;
- ✓ The effect of the presence of multiple changes;
- ✓ The effect of ambiguity in the direction information.

Tip: instead of thresholding, manually draw regions on the polar plot to isolate specific clusters of pixels.

C²VA: Example and Discussion of Results

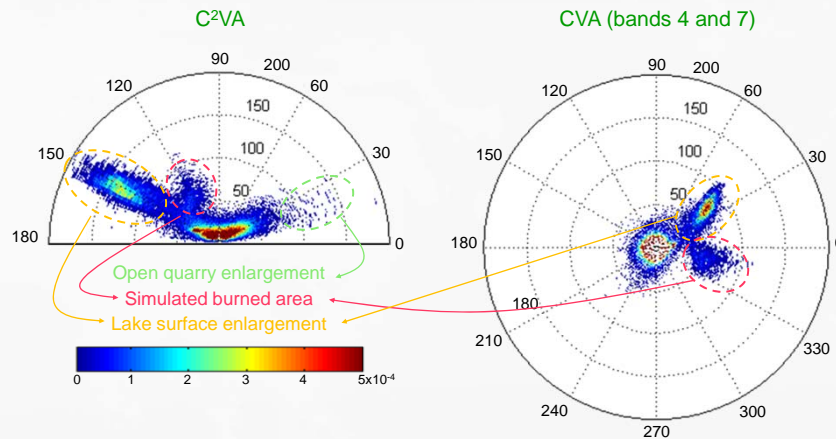

Study area: Lake Mulargia, Sardinia Island (Italy).

Multitemporal data set: a portion of 412×300 pixels of two images acquired by the TM sensor of Landsat-5 satellite in September 1995 and July 1996.

Changes: 2 natural changes, 1 simulated change

C²VA: Example and Discussion of Results

C²VA: Example and Discussion of Results

Advantages:

- ✓ C²VA permits to easily visualize the change information in polar coordinates without the need of pre-selecting pairs of spectral channels (which is difficult when no prior information on the kinds of changes present in the images is available).

Disadvantages:

- ✓ Some ambiguity may rise from the dimension reduction process mainly for the simplified representation of the angle variable: this may result in similar direction values for different kind of changes.
