

Towards the Concept of Analysis Ready Data for SAR: Applications to Snow Mapping

David Small, Christoph Rohner (UZH)

QA4EO-IDEAS Cal/Val Workshop #1
Rome, Italy, Feb. 20, 2020

SAR Constellations

- Sentinel-1A and Sentinel-1B acquiring >12TB per day
- Radarsat-2 a commercial enterprise
- Radarsat Constellation Mission (RCM) recently finished commissioning

- Sentinel-1 and RCM satellites have same central frequency
 - But they are in differing orbits: *systematic InSAR combinations unviable*
- Combining the backscatter amplitudes will still be possible, assuming acquisitions modes are selected to ensure *common polarisations*

- **Multisource Composite Backscatter maps**
 - Optical constellation composite products are the norm, e.g. for MODIS cloud clearing
 - Systematic composites from radar constellations not yet established

	Analysis Ready Data For Land (CARD4L)	Product Family Specification: Normalised Radar Backscatter
---	--	---

Radar terrain corrections

- Geometric Terrain Correction (**GTC**)
- Radiometric Terrain Correction (**RTC**)
- Wide area backscatter *composites* from Local Resolution Weighting (**LRW**)
- LRW backscatter *composite* time series are **Analysis Ready Data (ARD)**
 - *2D image time-series: Applicable over wide area, while lowering barrier to entry for analysis*
- **CEOS CARD4L** Analysis Ready Data for Land Processes 
 - Define standards for ARD backscatter products
 - RTC (L1): Terrain-flattening: **Normalised Radar Backscatter (CARD4L NRB)**
 - LRW (L3): Wide-area **Analysis Ready Data**
 - *NRB Document being finalised*
 - *After internal reviews, being submitted this month for consideration at CEOS Land Surface Imaging – Virtual Constellations (LSI-VC) meeting at end of Mar. 2020*

Document Status

For Adoption as: **Product Family Specification, Normalised Radar Backscatter**

Terrain-flattened Gamma Nought

Dept. of Geography / Remote Sensing Laboratories

Revisit Interval: Breaking the tyranny of exact repeat passes

For *Regular Intervals* with temporal resolution better than repeat-pass interval

- Use moving time-window integrating **information from all tracks**

- The more (diverse!) data (and tracks) the better – esp. combine ascending and descending observations

Backscatter contributions

Weights inverse to local area

Radarsat Constellation Mission: 3 new C-band Satellites launched in 2019

- Open-data policy
- Six active C-band satellites: S-1A, S-1B, RS2, RCM1-3
- Integration of RCM into S-1 composite data flow

Jan. 13, 2020

QA4EO-IDEAS Phase 1 Outlook

1. Review and comment on CEOS CARD4L Normalized Backscatter Documentation:
 - In progress: Updated version **NRB** document nearing completion within team and will
 - RTC backscatter selected as basis for all CARD4L backscatter products (**NRB**, **polarimetric**, interferometric, geocoded SLC all in progress)
2. Antenna-pattern boost to Noise:
 - Estimate and optionally subtract local noise values in S-1 products during RTC production
3. Investigate acceleration of L3 composite products
4. Optional further supplementary work not in core package:
 - Radarsat Constellation Mission: Test integration of calibrated product input
 - CEOS SAR Workshop announced today will be Oct. 6-9 hosted by CSA in *Longueuil, Canada*
 - Detailed evaluation of acceleration of L3 composite product generation
 - Demonstrate seasonal extended-area backscatter maps

Acknowledgments

Thanks for support from:

- WMO Polar Space Task Group for coordinating collaboration
- ESA/Copernicus <http://scihub.esa.int> for Sentinel-1 data
- Environment & Climate Change Canada (ECCC) & MDA for RS2 data
