Optical Sensors Sessions -
Room 1

20th November 2019

OUTLINE

- EDAP Presentation
- Geometric Assessment Methods
- Planet Results.
- Landsat / S2 Results

Earthnet Programme and Third Party Missions

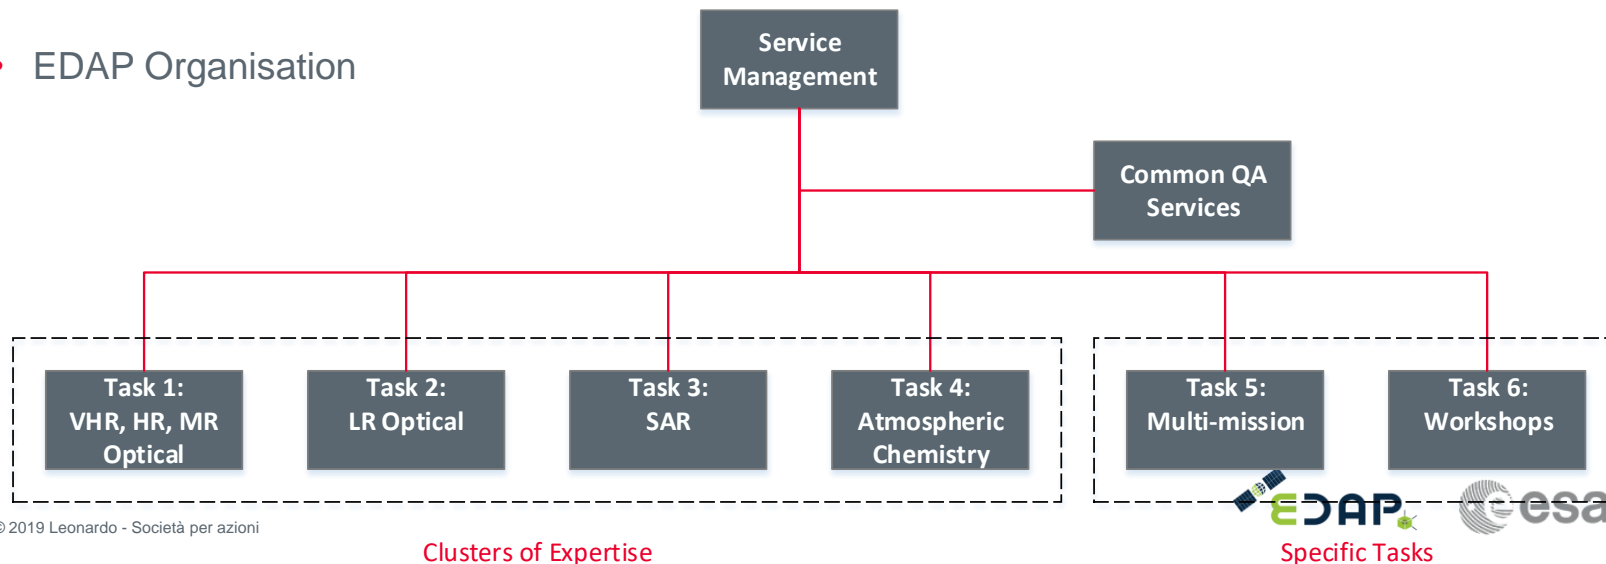

- ESA's Earthnet Programme provides the framework for “integrating” non-ESA missions (Third Party Mission - TPM) into the overall ESA Earth Observation (EO) portfolio, allowing data access and supporting the development of new research and applications
- Earthnet support to TPMs can be divided in two types of activities:
 - Support to TPM cal/val and routine data quality monitoring,
 - TPM data supply for science and research purposes
- In the recent years, the EO capacity from space has grown with the multiplication of both institutional and commercial missions; in particular the domain of high-resolution optical sensors and SAR (Synthetic Aperture Radar) has dramatically increased.
- In this context, the ESA Earthnet Data Assessment Pilot (EDAP) project aims to perform an early data assessment for various missions, which may potentially become TPMs, covering specifically identified calibration and validation related tasks

What is EDAP?

- **ESA's Earthnet Data Assessment Pilot (EDAP)** is a project a 2-years project, started in November 2018.
- EDAP is designed to **perform early data quality assessments** on existing and future Earth Observation (EO) missions from national or commercial providers
- It is achieved through provision of **clusters of expertise in various domains**
- Specific focus will also be put on **capacity building** in the relevant data provider with the set up and evolution of documentations, tools and procedures to allow to efficiently perform data quality assessments in the domains of expertise defined within this activity.

- EDAP Organisation

Service Domain Clusters & Input Missions

- The missions covered in each of the Domain Clusters:

TASK	Domain	Missions
Task 1	Very High, High and Moderate Resolution Optical	Planet – PlanetScope
		Planet – Skysat
		USGS Landsat
		KARI Kompsat 3
		SSTL DMC/Triplesat
		SSTL Superview
		SSTL Vision-1
		Earth-i Vivid-i
		BlackSky
		Proba-1 CHRIS
Task 2	Low Resolution Optical	ISRO OceanSat 2
		MOS
Task 3	Synthetic Aperture Radar	SAOCOM 1A/B
		ICEYE
		PAZ
Task 4	Atmospheric missions	GCOM-C1
		SPIRE
		Tansat
		Gosat-2
		GHGSat-D
Task 5	Multimission	DEM study
Task 6	Workshop organization	

Input products : Level 1C

“This level of imagery is orthorectified, which implies the removal of the perspective distortion and the influence of elevation differences. The orthorectified imagery can be used a planimetric map since the scale is uniform. Accurate reference digital terrain or surface models are needed to generate Level-1C imagery.”

Geometric Validation Items for L1C products

The Planimetric accuracy ,
The Band-to-band registration
The Multi temporal accuracy
The stereoscopic capability.

Reference Data (With known uncertainties)

Landsat 8 Quality Reports

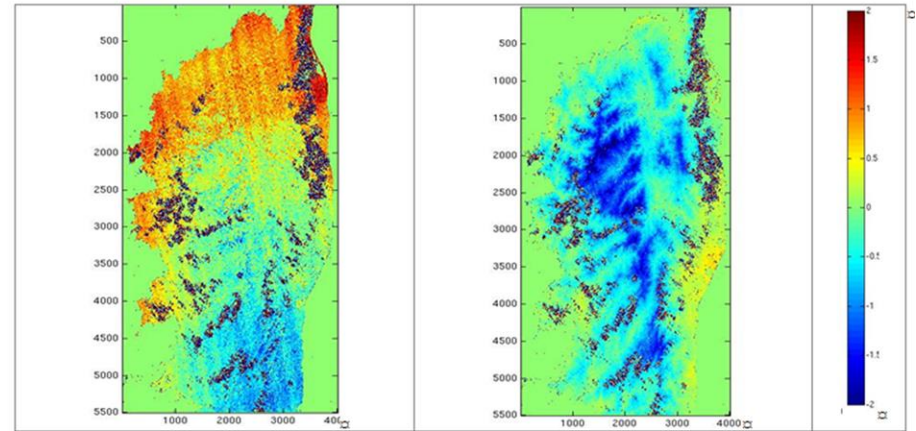

Validation activities of the Landsat 8 ESA Near Real Time (NRT) products are conducted on a monthly basis. The tests are performed on data from specific calibration / validation test sites including Libya-4 (the Pseudo Invariant Calibration Site (PICS)) and La Crau (France) (a Geometric Calibration Site). The following product specifications parameters are estimated, assessed and updated:

- **Radiometric Calibration Accuracy:** By monitoring, at a given date, the OLI Top of Atmosphere (TOA) reflectance measurements obtained from the Libya-4 test site and conducting inter-comparisons with equivalent data acquired under the same sun illumination conditions.
- **Geolocation Accuracy:** By monitoring the absolute / relative geometric registration between the Landsat 8 input images and a reference image.
- **Band to Band Registration Accuracy:** By monitoring the overall accuracy of image registration, activities for which different combinations of image twins are considered.

ALOS (2006 - 2011)
 JERS-1 (1992-1998)

- **Activities :**

- **Absolute geolocation accuracy** by using GCP set for product observed over La Crau, Piemonte & Wellington
- **Multi Temporal geolocation accuracy** by using data from the constellation, whatever the platform
- **Interband registration accuracy** by using data from all the sites, including (Libya 4 site).

- **Constraints :**

- Early assessment (short time period),
- Select representative products, (different platforms / version launch dates) ...

- **Missions Specification =>**

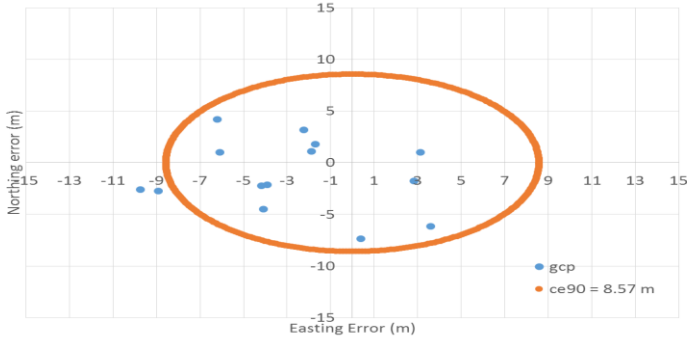

- **L1 Product Geometric Accuracy Specification (Public);**
(10.0 m RMSE)

CONSTELLATION OVERVIEW: PLANETSCOPE		
Mission Characteristics	International Space Station Orbit	Sun-synchronous Orbit
Orbit Altitude (reference)	400 km (51.6° inclination)	475 km (~98° inclination)
Max/Min Latitude Coverage	±52° (depending on season)	±81.5° (depending on season)
Equator Crossing Time	Variable	9:30 - 11:30 am (local solar time)
Sensor Type	Three-band frame Imager or four-band frame Imager with a split-frame NIR filter	Three-band frame Imager or four-band frame Imager with a split-frame NIR filter
Spectral Bands	Blue: 455 - 515 nm Green: 500 - 590 nm Red: 590 - 670 nm NIR: 780 - 860 nm	Blue: 455 - 515 nm Green: 500 - 590 nm Red: 590 - 670 nm NIR: 780 - 860 nm
Ground Sample Distance (nadir)	3.0 m (approximate)	3.7 m
Frame Size	20 km x 12 km (approximate)	24.6 km x 16.4 km (approximate)
Maximum Image Strip per orbit	8,100 km ²	20,000 km ²
Revisit Time	Variable	Daily at nadir (early 2017)
Image Capture Capacity	Variable	200 million km ² /day

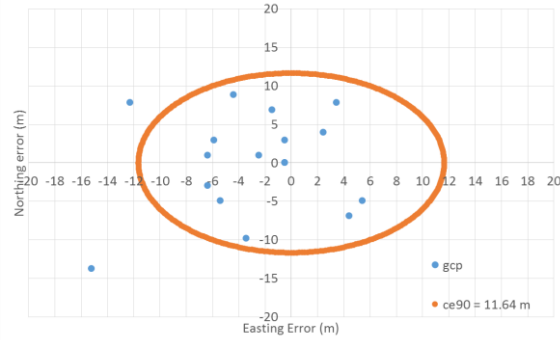

Planet DOVE Absolute geolocation

Absolute Accuracy (Piemont, GCP set)

Absolute Accuracy (La Crau, GCP set)

Absolute Accuracy (Wellington, GCP set)

Planet DOVE Multi Temporal geolocation

Planet DOVE Interband Registration

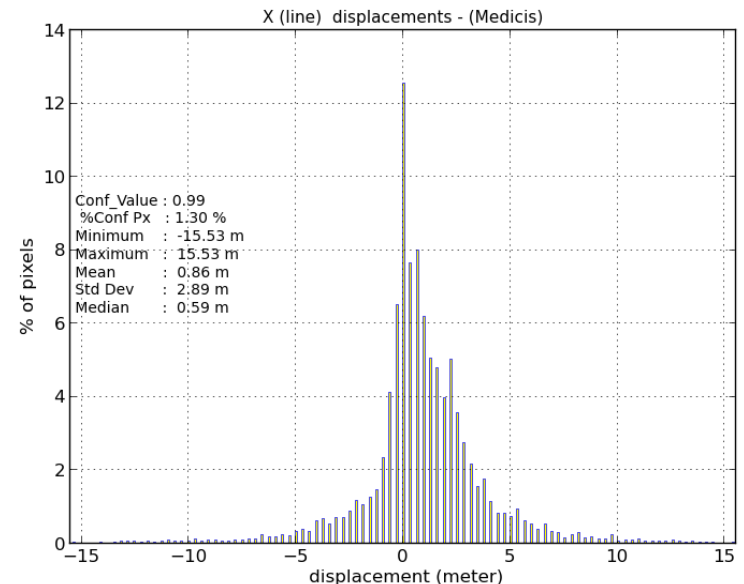

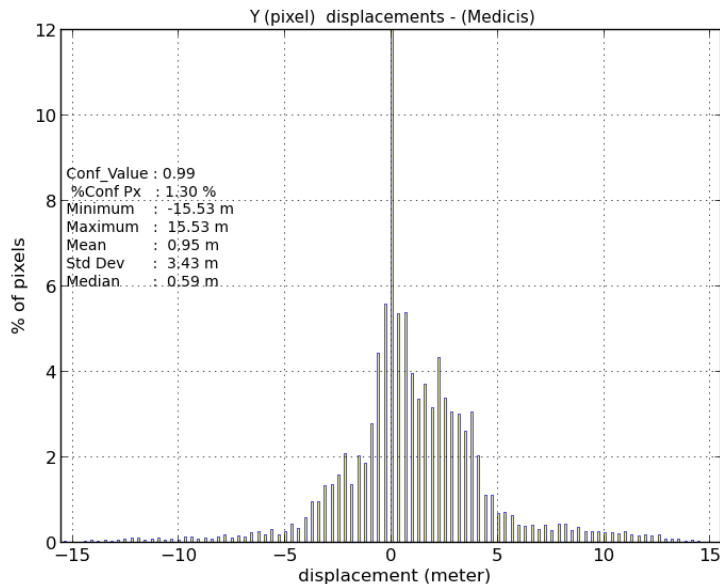

Band to band registration

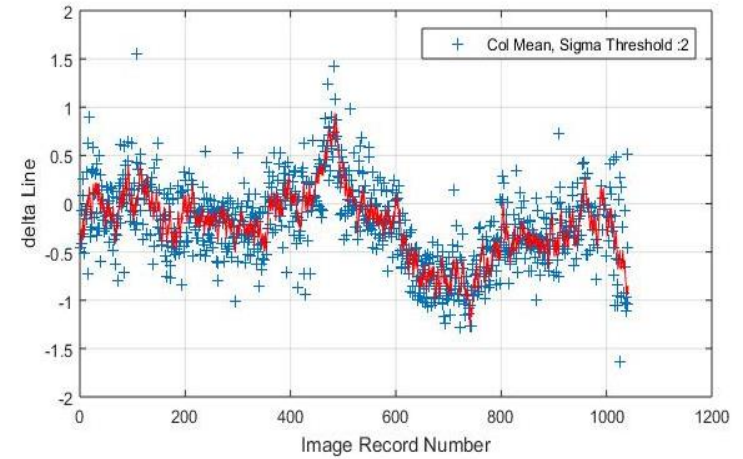

- **Absolute geolocation accuracy**
Results fully in agreement with the product accuracy specifications (10.0 m RMSE).
- **Multi Temporal geolocation accuracy**
Results are correct, somehow band dependant, exceeding 5.5 m CE90 for the NIR band.
- **Interband registration accuracy**
The product RMSE accuracy is within 0.2 pixel for band twins (1,2) and (2,3) while it is above when band 4 is involved.

- **Absolute geolocation accuracy**
We note that for Piemont and La Crau the CE@90 is high compared to RMSE
- **Multi Temporal geolocation accuracy**
We note geometric distortions mostly pronounced in the easting direction.
- **Interband registration accuracy**
The interband registration is not stable, meaning variability in the internal image.

Planet DOVE Assessment 2/3

- Wellington Geometric Test Field (South Africa),
- Image comparison, at the GCP location for a same cartographic scale 1:8000).
- The image quality of input RS image influences the GCP Pointing accuracy

Constellation Assessment / «Orbit» Analysis

- Motivation 1 : Discern systematic / Non systematic effects in the Level 1C geometry, an analysis as close as possible to the sensor geometry.
- Motivation 2 : Evaluate interoperability between Missions
- Input Mission : All Landsat MSS / TM / EMT+ / OLI data, Sentinel 2 data, **GLS**
- History : First results presented @SPIE 2019 & Questions (for me)
- Current Method : Collect L1C data and performed Image matching in the Space Oblique Mercator between full orbits.
- Reference 1 : Evaluation of the geometric accuracy across the European Space Agency (ESA) Landsat historical archive. (Saunier & Al, 2019) , <https://doi.org/10.1117/12.2533198> (previous method)

SOM Background

Figure A-3 Sample Partial MISR Swath in SOM vs. Distorted Geographic Lat/Lon

SOM on the left exhibits minimal distortion at all latitudes, whereas the Geographic Lat/Lon projection on the right exhibits much greater distortion in size and shape at high latitudes (towards the top).

The Space Oblique Mercator (SOM) map projection was developed to support LandSat which covers the same large geographic extent as MISR.

SOM was designed to minimize the shape distortion and scale errors throughout the length of the MISR swath near the satellite ground track.

SOM X is in the direction of the Spacecraft ground track and SOM Y is perpendicular X

Brian E. Rienecker, JPL, Cal Tech, Workshop Sep. 19, 2005

- [S2 data] : No Georeferencing Model refinement with a GCP set (GRI) PlanetDem 90.0 m (2015)
- [Landsat TPM data] : Refinement with GCP set from the GLS product (ESA Processing) SRTM V3.0
- [Landsat 8 data] : Refinement with GCP set from GLS product, Collection-1 products.
(INFO : LS8 L1C data processing with GCP adjusted to the GRI foreseen for Collection-2 (1st Quarter 2020))

Constellation Assessment / «Orbit» Analysis - matching results

S2A / S2B

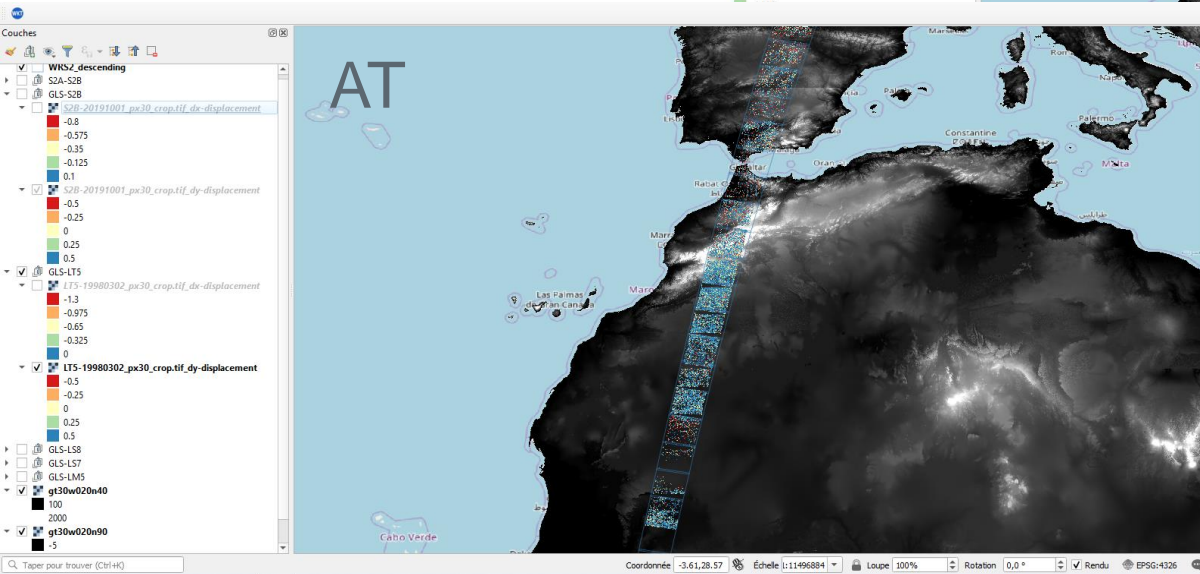

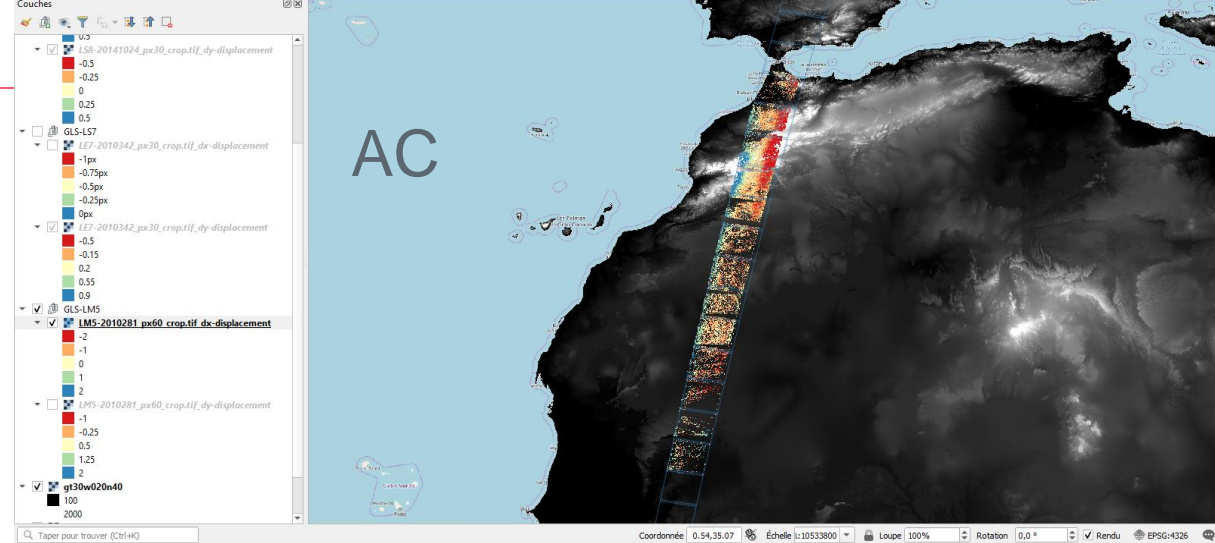

Constellation Assessment

/ «Orbit» Analysis - matching results

GLS / LM5 (MSS)

GLS / LT5 (TM)

(systematic effects)

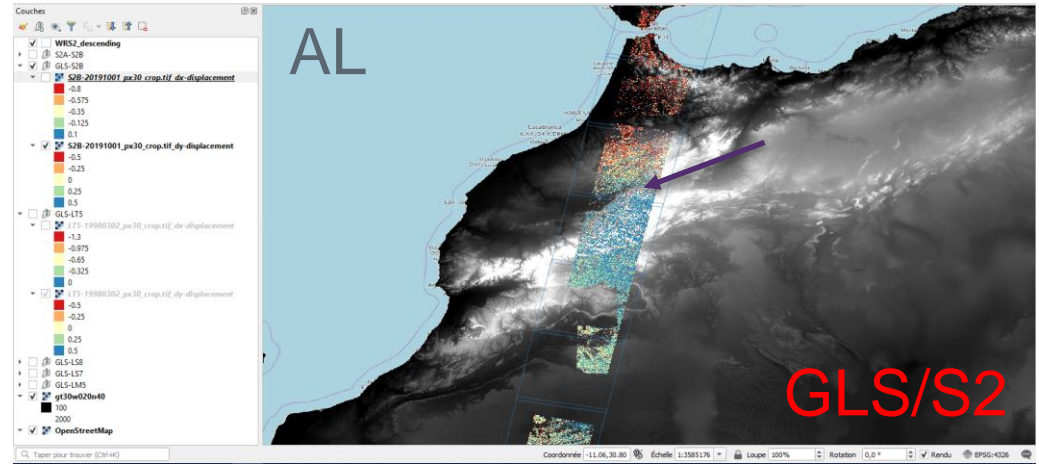

Constellation Assessment

/ «Orbit» Analysis matching results

GLS/ S2, LS8 / S2

(non systematic)

GLS / LS8

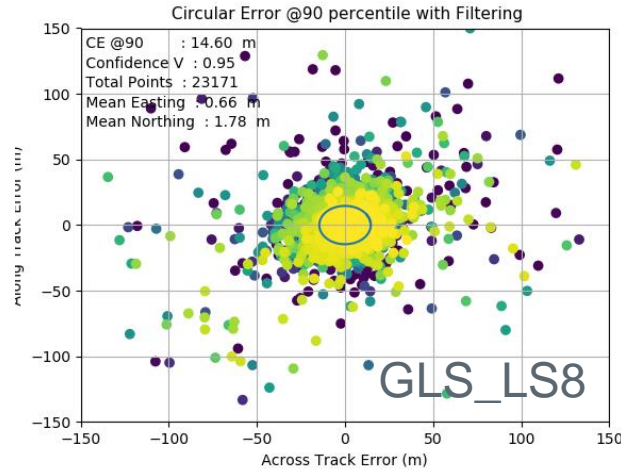

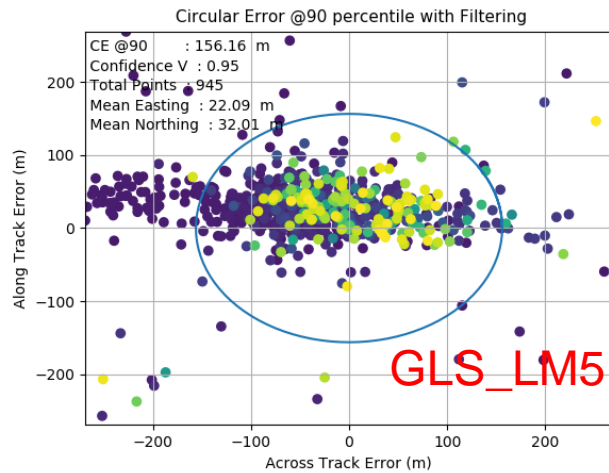

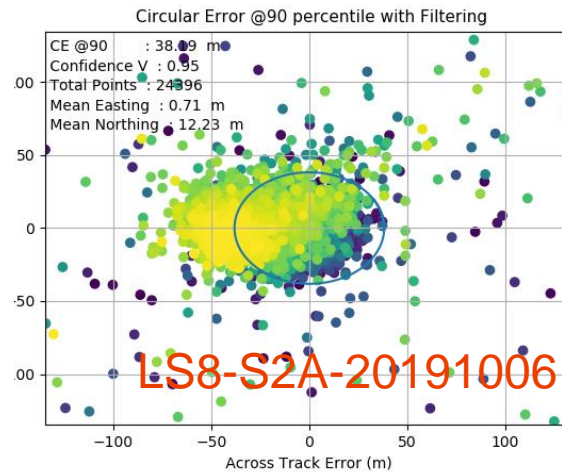

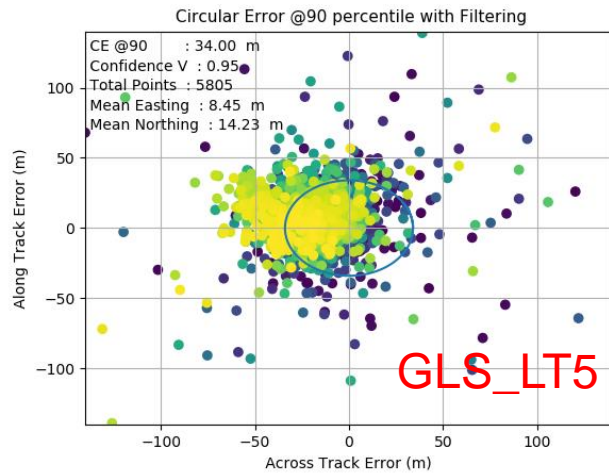

For some regions, the image information to be matched is poor.
(The Level 1 processing might failed to find and accurate GCP set for georeferencing?)

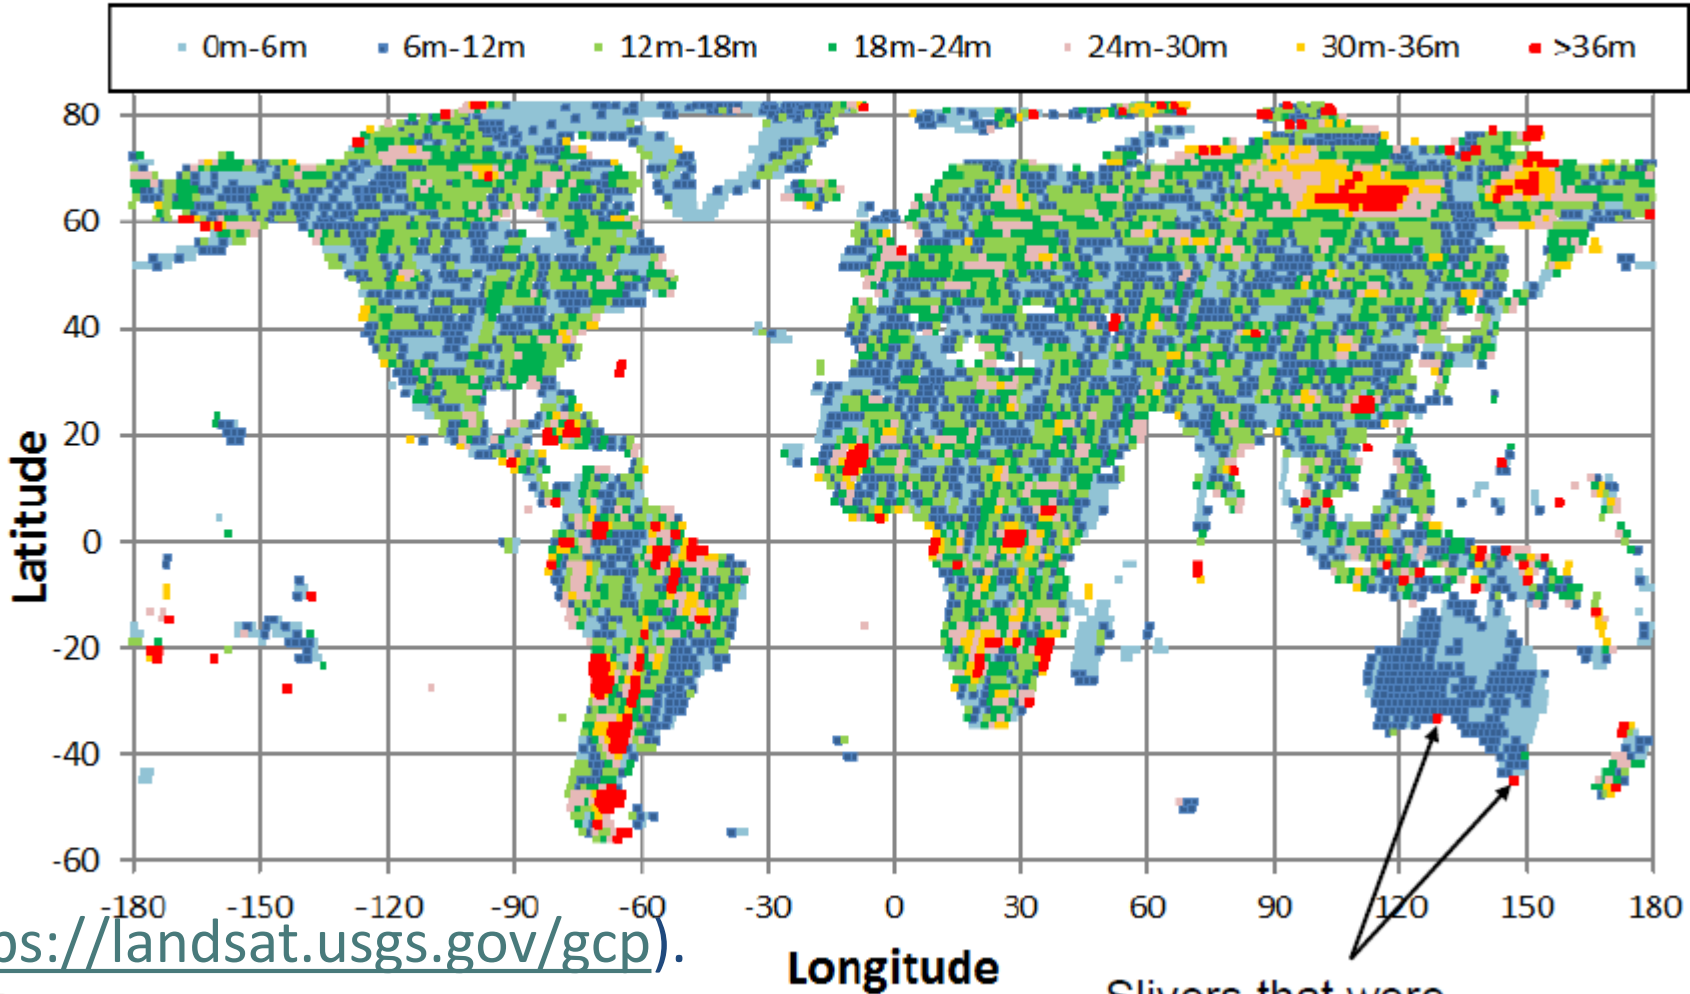

- Assessing with an Alternative methods for matching (LS8/S2)
- Promising results !!!
- Deviation confirms

L8 Estimate of GLS Horizontal Error

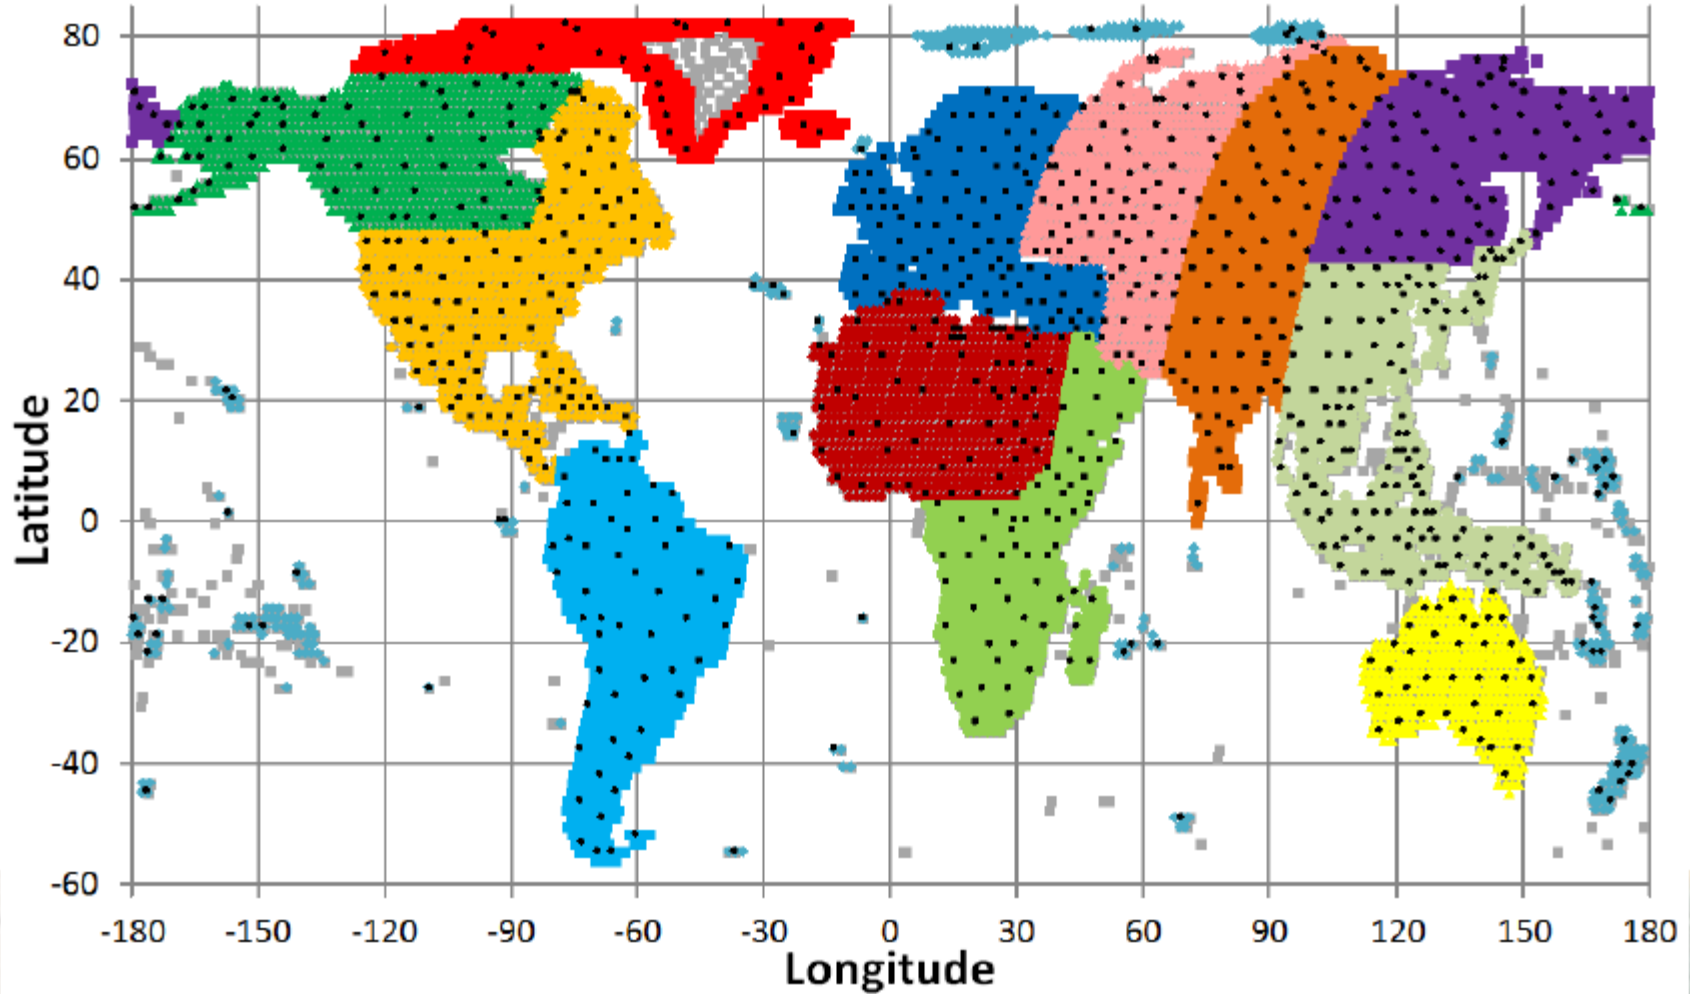

- Task 1 EDAP framework for geometric analysis is set up and used in an operational way to assess input missions.
- The reference data are essential
- The proposed QC / Validation methodologies provides consistent accuracy measured,
- It has been shown that the analysis of products for a long term orbit period is usefull.
