EDAP Project Activities

- To perform an **Early Data Assessment on various existing, new and future EO missions** that fall into one of the following instrument domains:
 - Very High Resolution (**VHR**), High Resolution (**HR**) and Medium Resolution (**MR**) Optical
 - Low Resolution (**LR**) Optical
 - Synthetic Aperture Radar (**SAR**)
 - Atmospheric
- To undertake specific **multi-mission studies**, which contribute to interoperability across existing and future missions and help foster synergies between these missions.
- To provide support for the **organisation of ESA Workshops** that focus on data quality assessment of different types and groups of EO mission sensors, with the aim to provide a forum for assessing and discussing the data quality of existing and future TPMs
- Provide a focus on the generation of methodologies and guidelines for training and **capacity building**, with the relevant Mission / Data Providers, particularly for the commercial missions with regards to efficient data quality assessments in the preparation for future missions.

Contents Motivation & Background

Development of EO QA Frameworks

An EO QA Framework for commercial missions

Mesures

How do we make sure a wing built in one country fits a fuselage built in another?

A close-up photograph of a silver metal chain against a black background. The chain is composed of several interlocking links. One link in the center is highlighted in a bright yellow color. Surrounding this central link are five white text labels: 'Traceability: An unbroken chain' at the top, 'Comparison' at the top right, 'Audits' on the left, 'Rigorous uncertainty analysis' at the bottom left, and 'Documented procedures' at the bottom right. The central yellow link contains the letters 'SI' in a bold, yellow, serif font.

**Traceability:
An unbroken chain**

Comparison

Audits

SI

**Rigorous uncertainty
analysis**

**Documented
procedures**

Lamp

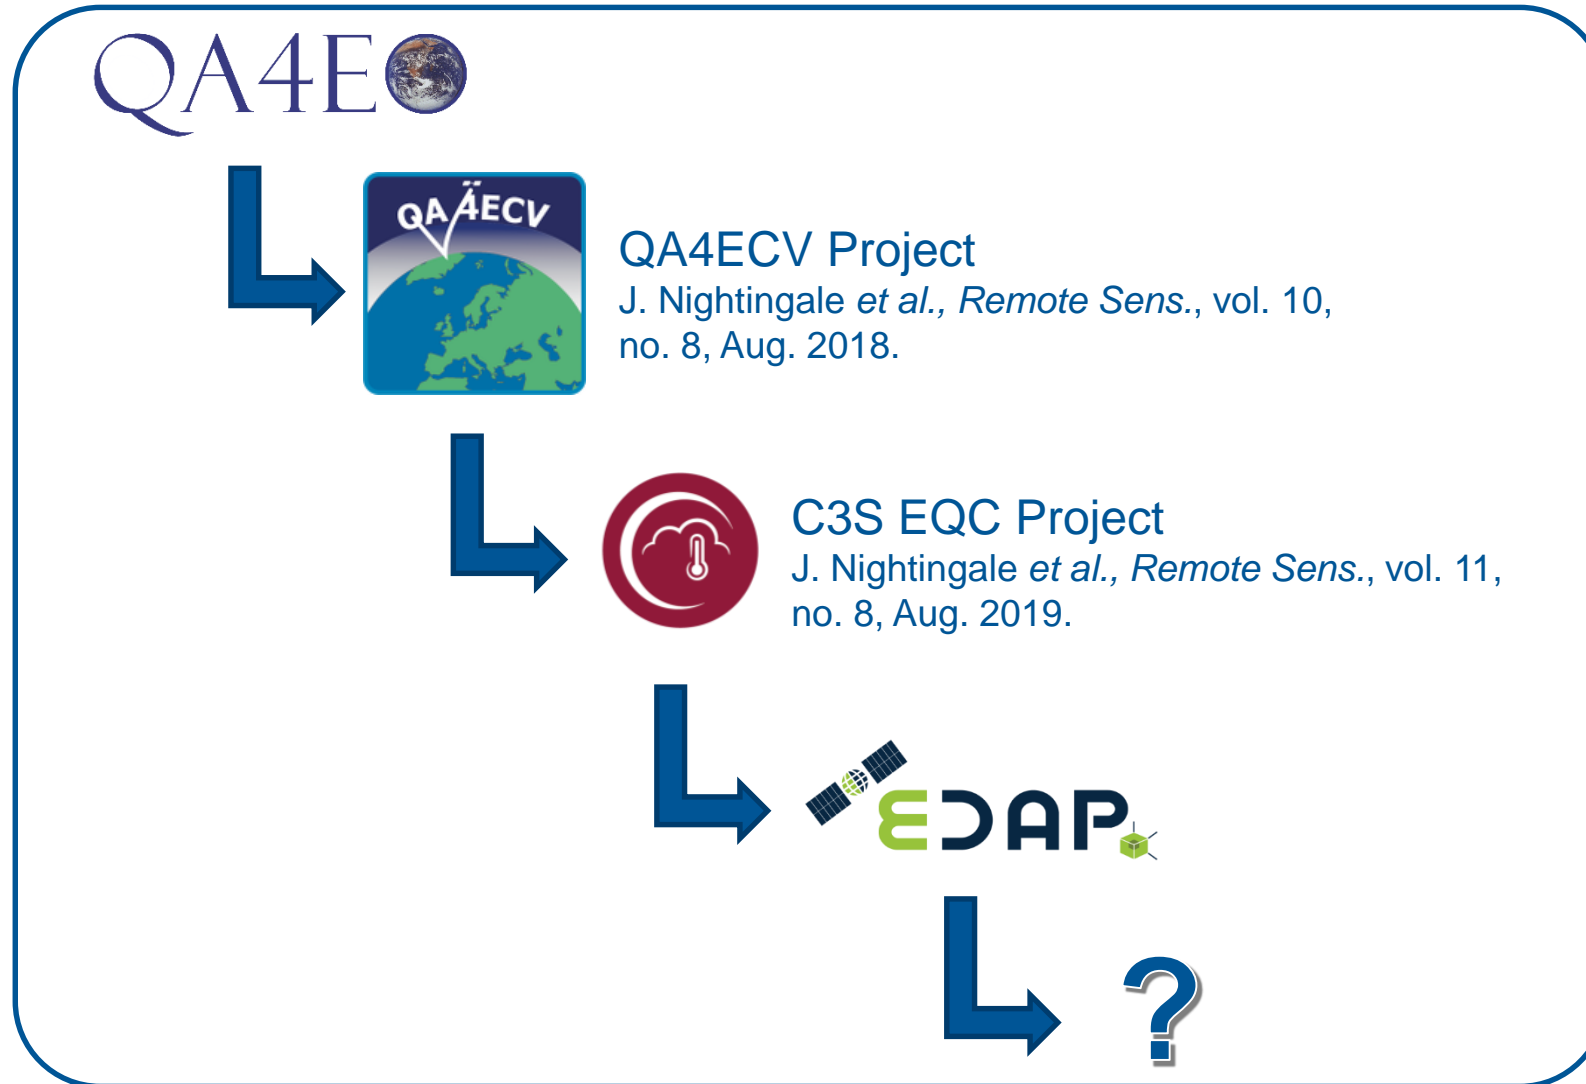

Field Radiometer

QA4E Principle

*“It is critical data and derived products are easily accessible in an open manner and have associated with them an indicator of their quality traceable to reference standards (preferably SI) to enable users to assess its suitability for their application i.e. its **fitness for purpose**.”*

Evaluation and Quality Control for Observations

| Details | Generation | Quality flags | Uncertainty Characterisation | Validation | Inter-comparison |
|--|------------------------------|---------------|-------------------------------------|--------------------------------------|--|
| Product Information | Input data and uncertainties | Quality Flags | Uncertainty Characterisation Method | Reference data representativeness | Scale of inter-comparison activities |
| Product Description | Sensor Calibration | | Uncertainty sources included | Reference data uncertainty inclusion | Inter-comparison method |
| Coverage and Resolution | Algorithm method | | Uncertainty values provided | Validation method | Product uncertainties inclusion |
| Data gaps | Algorithm tuning | | Temporal stability | Validation results | Discrepancy between products identified and, if possible, resolved |
| Data set limitations and target applications | Sensitivity analysis | | Geolocation uncertainty | | |
| Documentation | Internal Processes | | | | |
| | Traceability | | | | |

Quality Assessment Matrix

Example Product

Quality Evaluation

Each stage of the production of this data set has been independently evaluated. This judgement is based on the methods used and also the degree of quality information which is provided. The results of this are illustrated in the following matrix showing the evaluation by section.

To find out more detail about these sections, click on the sub-section.

| Details | Generation | Quality flags | Uncertainty Characterisation | Validation | Inter-comparison |
|--|------------------------------|---------------|-------------------------------------|--------------------------------------|--|
| Product Information | Input data and uncertainties | Quality Flags | Uncertainty Characterisation Method | Reference data representativeness | Scale of inter-comparison activities |
| Product Description | Sensor Calibration | | Uncertainty sources included | Reference data uncertainty inclusion | Inter-comparison method |
| Coverage and Resolution | Algorithm method | | Uncertainty values provided | Validation method | Product uncertainties inclusion |
| Data gaps | Algorithm tuning | | Temporal stability | Validation results | Discrepancy between products identified and, if possible, resolved |
| Data set limitations and target applications | Sensitivity analysis | | Geolocation uncertainty | | |

EDAP Framework Principles

- Should describe high-level principles and activities common for assessment of all EO missions.
- Starting point is to describe the “ideal” case for a given category – aspiration which may not often be met.
- Grading based on mission **fitness for purpose** based on stated performance and application area.
- Assessment itself is the “ideal” case. Some aspects of assessment may be out of scope within EDAP.

EDAP Quality Assessment Matrix

| Product Information | Product Generation | Ancillary Information | Uncertainty Characterisation | Validation |
|---|---|---|-------------------------------------|-----------------------------------|
| Product Details | Sensor Calibration & Characterisation Pre-Flight | Product Flags | Uncertainty Characterisation Method | Reference Data Representativeness |
| Availability & Accessibility | Sensor Calibration & Characterisation Post-Launch | Ancillary Data | Uncertainty Sources Included | Reference Data Quality |
| Product Format | Retrieval Algorithm Method | } If target mission data product is Level 2 | Uncertainty Values Provided | Validation Method |
| User Documentation | Retrieval Algorithm Tuning | | Geolocation Uncertainty | Validation Results |
| Metrological Traceability Documentation | Additional Processing | | | |

| Key | |
|-----|------------------------|
| | Not Assessed |
| | Not Assessable |
| | Basic |
| | Intermediate |
| | Good |
| | Excellent |
| | Information Not Public |

Example Assessment: Oceansat-2

Mission Assessment Guidelines

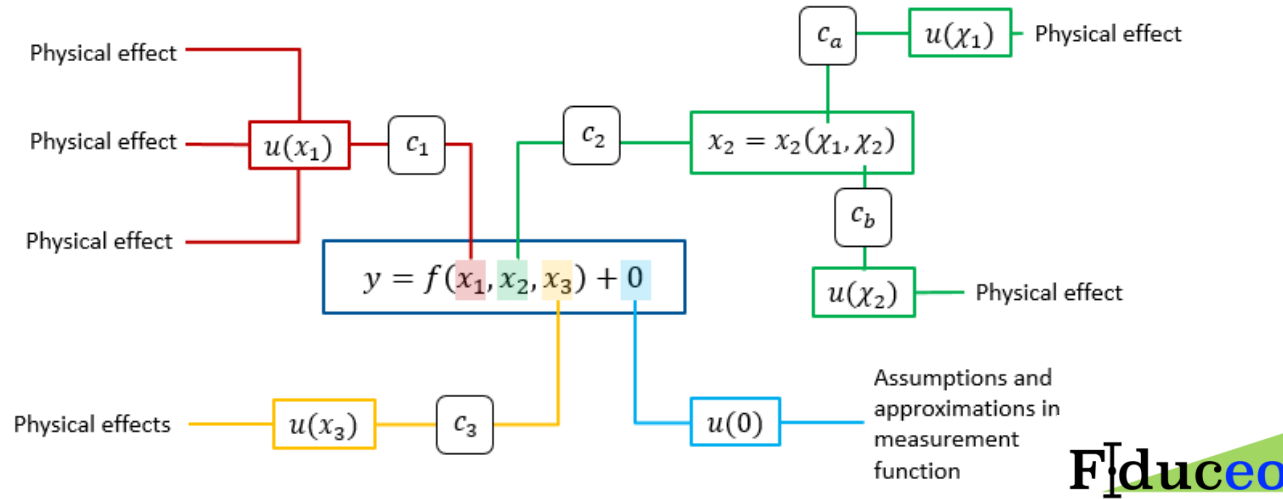

Guidelines prepared to describe generic assessment criteria per matrix cell.

Available:

<https://earth.esa.int/web/sppa/activities/edap-best-practice-guidelines>

Example: Uncertainty Characterisation

Description of Best Practice

Earth observation metrology techniques developed within the H2020 FIDUCEO project.

www.fiduceo.eu

Grading Criteria

Based on the extent to which application of the Guide to the Expression of Uncertainty is applied, wrt fitness for purpose in the context of the assessed mission

| Grade | Criteria |
|----------------|--|
| Not Assessed | Assessment outside the scope of study. |
| Not Assessable | Uncertainty characterisation not performed or method not documented. |
| Basic | Uncertainty established by limited comparison to measurements by other sensor/s Not by independent assessment and then comparison. |
| Intermediate | Limited use of GUM approach, and/or, an expanded comparison to measurements by other sensors. |
| Good | GUM approach to estimate measurement uncertainty with full breakdown of components and separated as Type A or B classification. |
| Excellent | GUM approach to estimate measurement uncertainty, including a treatment of error-covariance. |

Optical Mission Assessment Guidelines

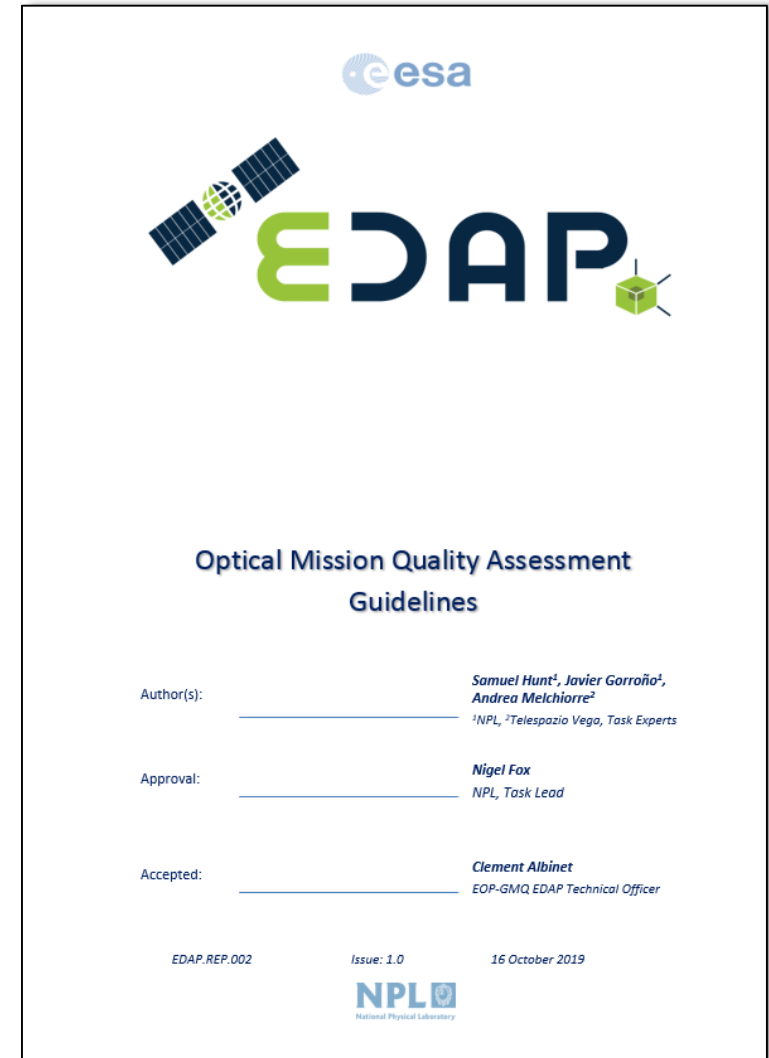

New guidelines prepared to describe more specific optical assessment criteria.

Include more information for optical sensors where required and reference appropriate additional material.

Available Soon:

Example of Best Practice

The screenshot displays two overlapping web pages. The top page is the CEOS Cal/Val Portal, featuring a navigation menu with items like 'Home', 'CEOS WGCV', 'Docs & Forum', 'Cal/Val Sites', 'Projects', 'Data Access & Tools', and 'Feedback'. The bottom page is the RadCalNet portal, which includes a search bar, a 'Categories' dropdown, and a list of document titles. A central yellow banner for 'esa SPPA Sensor Performance, Products and Algorithms' is visible, with a navigation menu containing 'EO Mission Performance', 'Documentation', 'Activities', and 'Meetings & Workshops'. Below this, a breadcrumb trail reads 'Home > Activities > Fiducial Reference Measurements: FRM'. The main content area is titled 'Fiducial Reference Measurements: FRM' and contains a paragraph of text followed by a table of FRM projects.

| | |
|---|-------------------------------|
| FRM4VEG: Fiducial Reference Measurements for Vegetation | External link |
| FRM4SOC: Fiducial Reference Measurements for Satellite Ocean Colour | External link |
| FRM4ALT: Fiducial Reference Measurements for altimetry | External link |
| FRM-BOUSSOLE: Buoy for the acquisition of long-term optical time series | External link |
| FRM4DOAS: Fiducial Reference Measurements for Ground-Based DOAS Air-Quality Observations | External link |
| FRM4GHG: Reference Measurements for Ground-Based FTIR Greenhouse Gas Observations | External link |
| FRM4STS: Fiducial Reference Measurements for validation of Surface Temperatures from Satellites | External link |
| Pandonia FRM: Fiducial Reference Measurements for Ground-Based Direct-Sun Air-Quality Observations | External link |

Sensor Characterisation and Calibration Post-Launch & Validation

Link to good practice material available from a variety of sources:

- CEOS Cal/Val portal, e.g. definition of PICS
- RadCalNet portal
- ESA FRM Projects
- Scientific literature

Reporting Assessments

- Generic template report for EDAP quality assessments, to provide consistent output across to project and ease comparison.
- Intended to not be overly prescriptive. Provides a location to summarise findings and reference more detailed reports.
- Contains completed quality assessment matrix.

Conclusions

- There is a need in EO to provide users with independent quality assessments of satellite missions, so they may assess if data is *fit for their purpose*.
- ARD producers can benefit from standardised quality assessment information to ensure traceability and trustworthiness of their data products.
- The EDAP Mission Quality Assessment Framework provides as rigorous approach to achieve this, based on the QA4EO principle.
