Ref: ESA/PB-EO(2019)10, rev.1 - Long Term Scenario

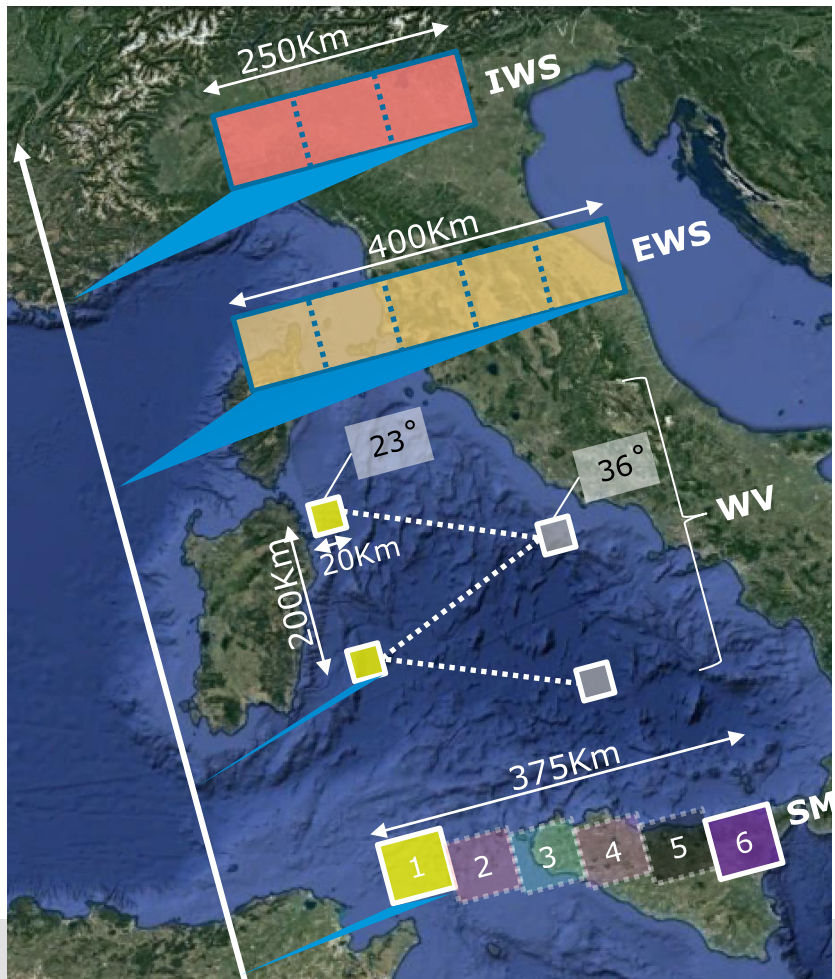

# Sentinel-1A/B System Baseline

- Constellation of two satellites (A&B) launched on 3-Apr-14 and 25-Apr-16
- C-Band SAR Payload at 5.405 GHz
- Near-Polar, sun-synchronous (dawn-dusk) orbit at 698 km
- 6 days repeat cycle for the constellation
- Four Dual-Pol SAR Modes of Operation
- Data downlink of 520 Mbps (2x260) in X-Band with 3 Ground Stations (Svalbard, Matera, Maspalomas) and via Laser (EDRS)

- Rad. Stability better than 0.6dB ( $3\sigma$ )
- Rad. Accuracy better than 1.0dB ( $3\sigma$ )
- NESZ better than -22dB

# Sentinel-1 core products

			L2 OCN		
	L1 SLC	L1 GRD	Wind	Swell	Vel
IW				N/A	Not qualified...YET
EW	Not generated			N/A	
WV		Not generated	Cal/val		
SM			Mainly Cal/val		

# Sentinel-1 Constellation Observation Scenario: Mode - Polarisation - Observation Geometry

validity start: 05/2019

Updated Baseline Map , starting May 2019

This map is related to SAR High Rate modes only. Wave mode operated by default over open oceans (not shown)

*an outstanding coverage achievement for a SAR mission, predictable and reliable!*

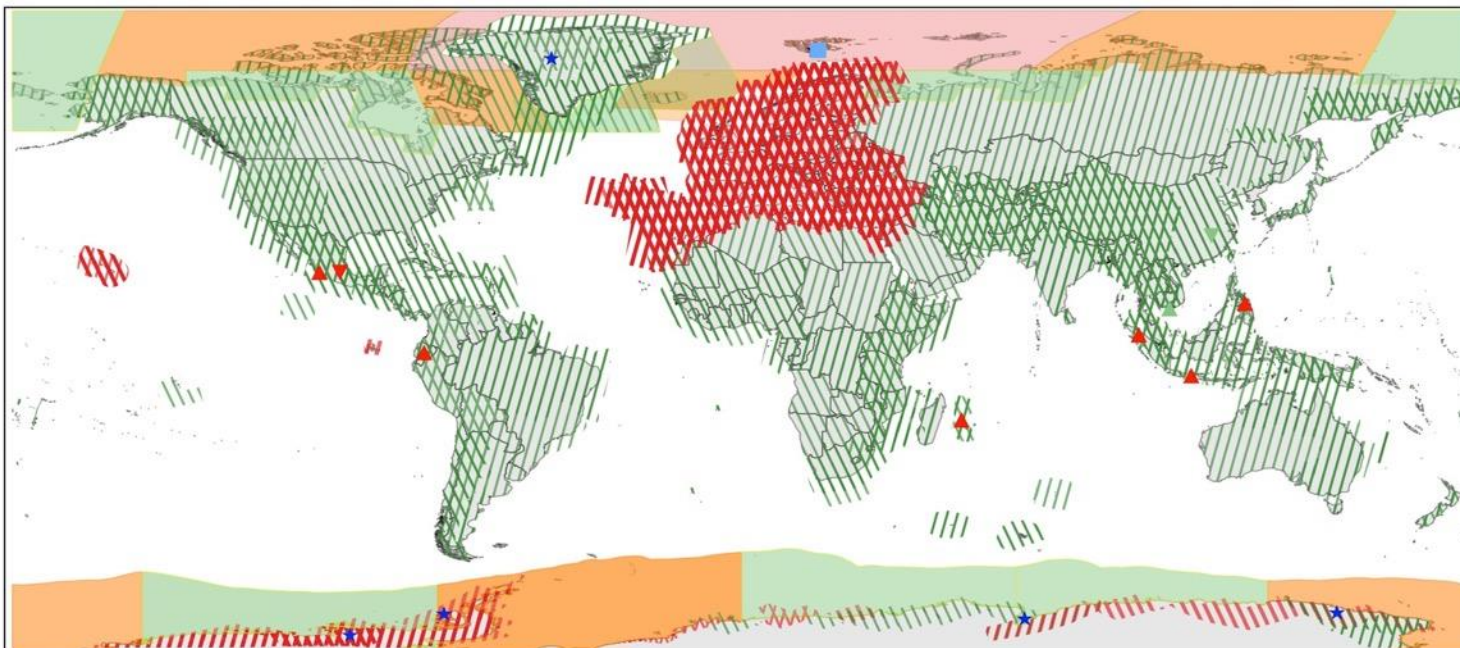

# Sentinel-1 Constellation Observation Scenario: Revisit & Coverage Frequency

validity start: 05/2019

PASS	REVISIT	FREQUENCY *	COVERAGE	FREQUENCY **	REFERENCE DATA SITES (6d repeat)
<ul style="list-style-type: none"> <li>ASCENDING</li> <li>DESCENDING</li> </ul>	<ul style="list-style-type: none"> <li>6 days</li> </ul>	<ul style="list-style-type: none"> <li>12 days</li> </ul>	<ul style="list-style-type: none"> <li>1 days</li> <li>1-3 days</li> <li>2-4 days</li> </ul>	<ul style="list-style-type: none"> <li>12 days</li> </ul>	<ul style="list-style-type: none"> <li>Highly active volcanism</li> <li>Fast subsidence</li> <li>Short growth cycle, intensive agriculture</li> <li>Fast changing wetlands</li> <li>Fast moving outlet glaciers</li> <li>Permafrost &amp; glaciers</li> </ul>

\* coverage ensured from same, repetitive relative orbits  
 \*\* coverage not considering repetitiveness of relative orbits

Updated Baseline Map ,  
starting  
May 2019

This map is related to SAR High Rate modes only. Wave mode operated by default over open oceans (not shown)

*an outstanding coverage achievement for a SAR mission, predictable and reliable!*

# Cal/Val organization during Phase E2

The cal/val and algo development activities are procured through a dedicated service contract – Mission Performance Center – taking over after Phase E1.

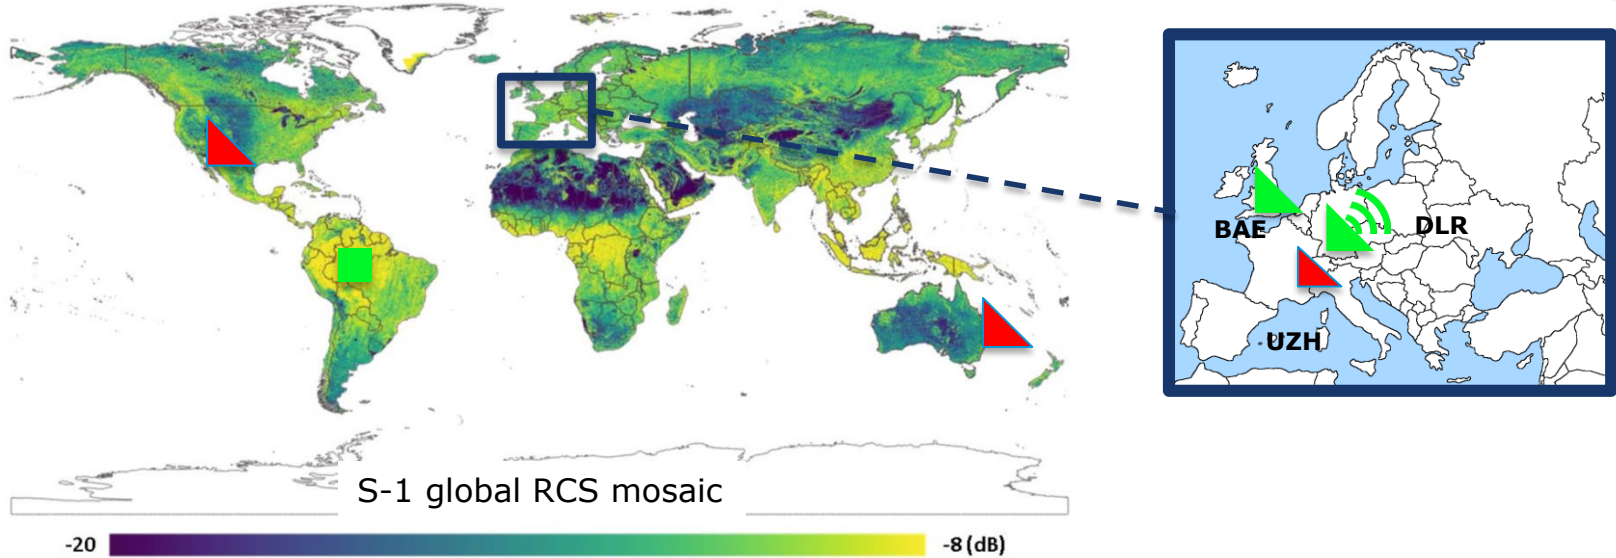

The scope of the MPC is to maintain and improve the product performance and calibration during the phase E2

S-1 MPC is composed by pan European value adding companies and, institutions providing expertise in SAR and S-1 in particular:

- **CLS brest (F)**: Prime, L2 algo
- **BAE Systems (UK)**: Radiometric Cal.
- **UZH (CH)**: Geometric Cal.
- **Aresys (IT)** : L1 algo & Instrument
- **Norut (N)**: L2 algo
- **Ifremer (F)**: L2 Validation
- **DLR (G)** : FRM and L1 calibration

# S-1 calibration sites

- Several calibration sites are used for radiometric, polarimetric and geometric calibration:

-  DLR calibration sites (transponders and Corners)
-  BAE CR radiometric calibration
-  UZH, JPL & GA CR for geometric calibration
-  Amazonian Rain-Forest for the verification of the range dependent corrections

# Spoiling some results...

## Sentinel-1 A/B @ CEOS WGCV

S-1 MPC

Peter Meadows (BAE Systems Applied Intelligence)

### Mutual interferences between C-Band SAR: Prediction of occurrences identification of sources

Hajduch Guillaume (CLS)

### Cross-Sensor Calibration of Sentinel-1 Noise Level

Niccoló Franceschi (Aresys)

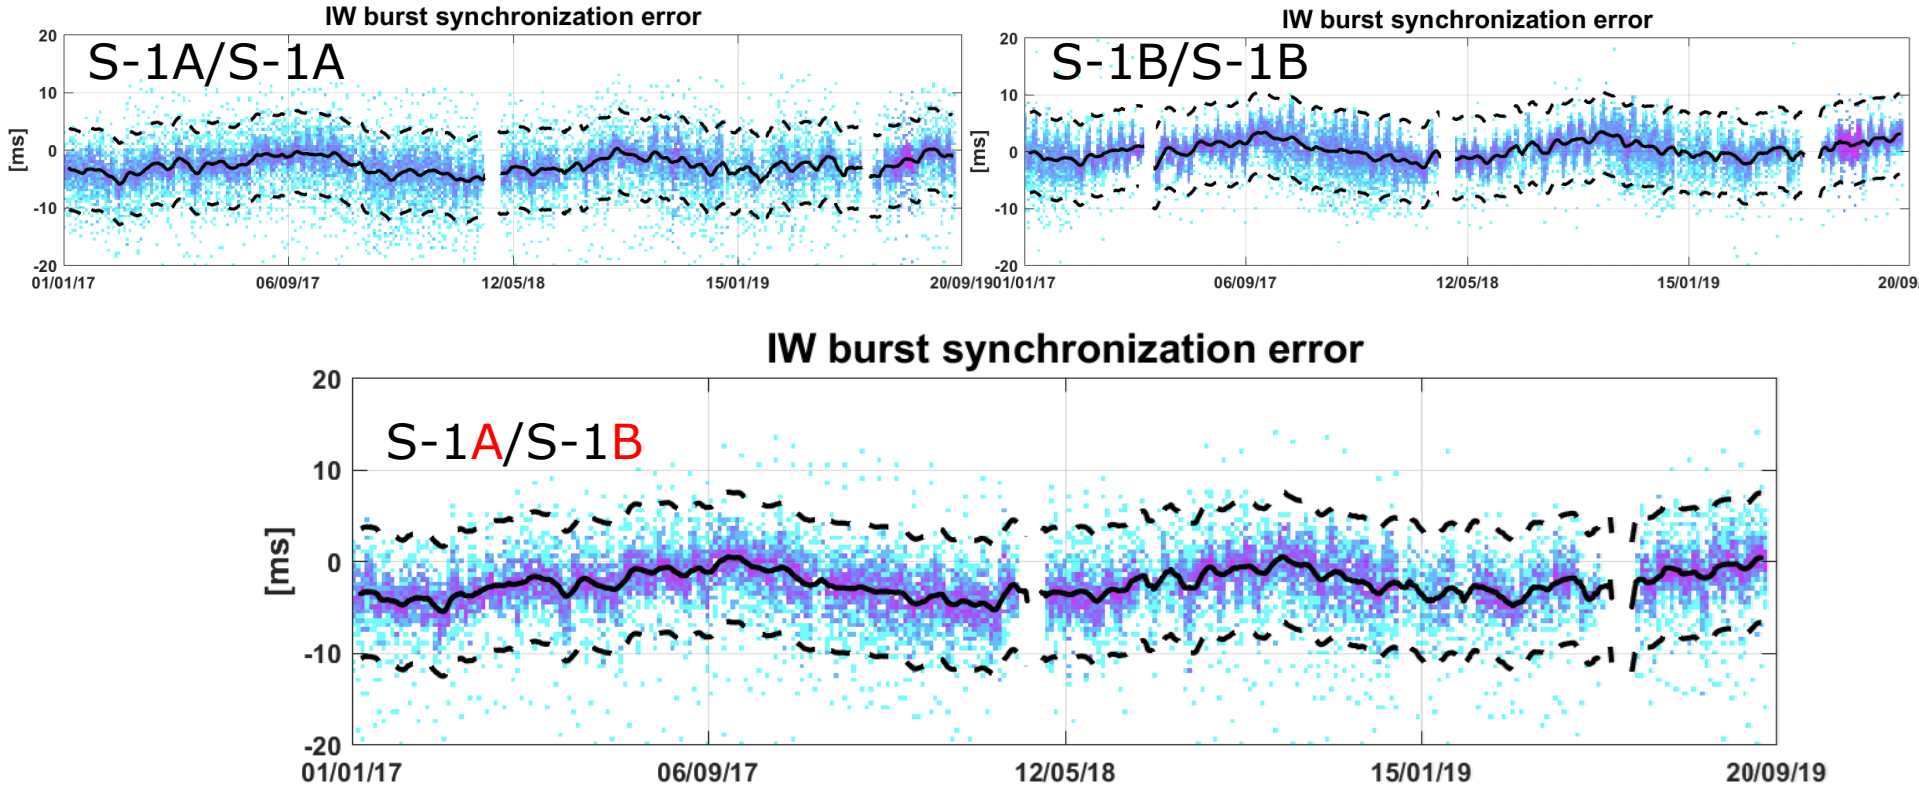

### Towards Operational SAR Imaging Geodesy: An Extended Time Annotation Dataset for Sentinel-1 Image Products

Thursday

Christoph Gisinger (DLR)

# IW burst synchronisation

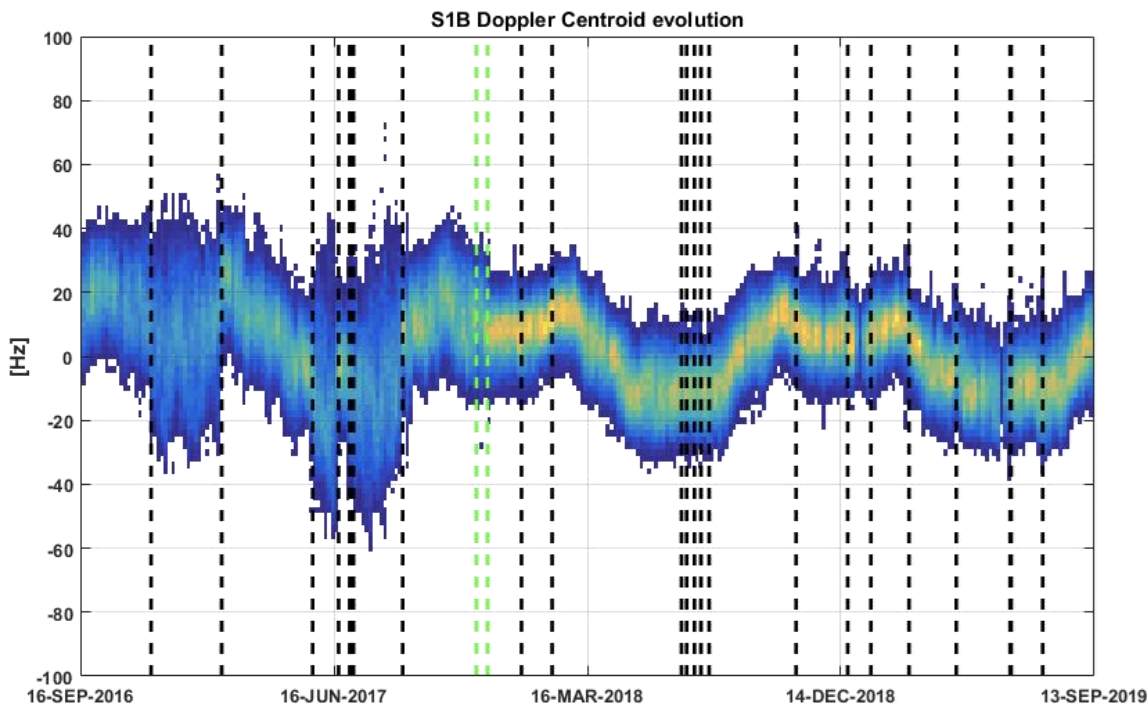

# Interferometric baseline

S-1 A and B are controlled in a stringent orbital tube of 200m

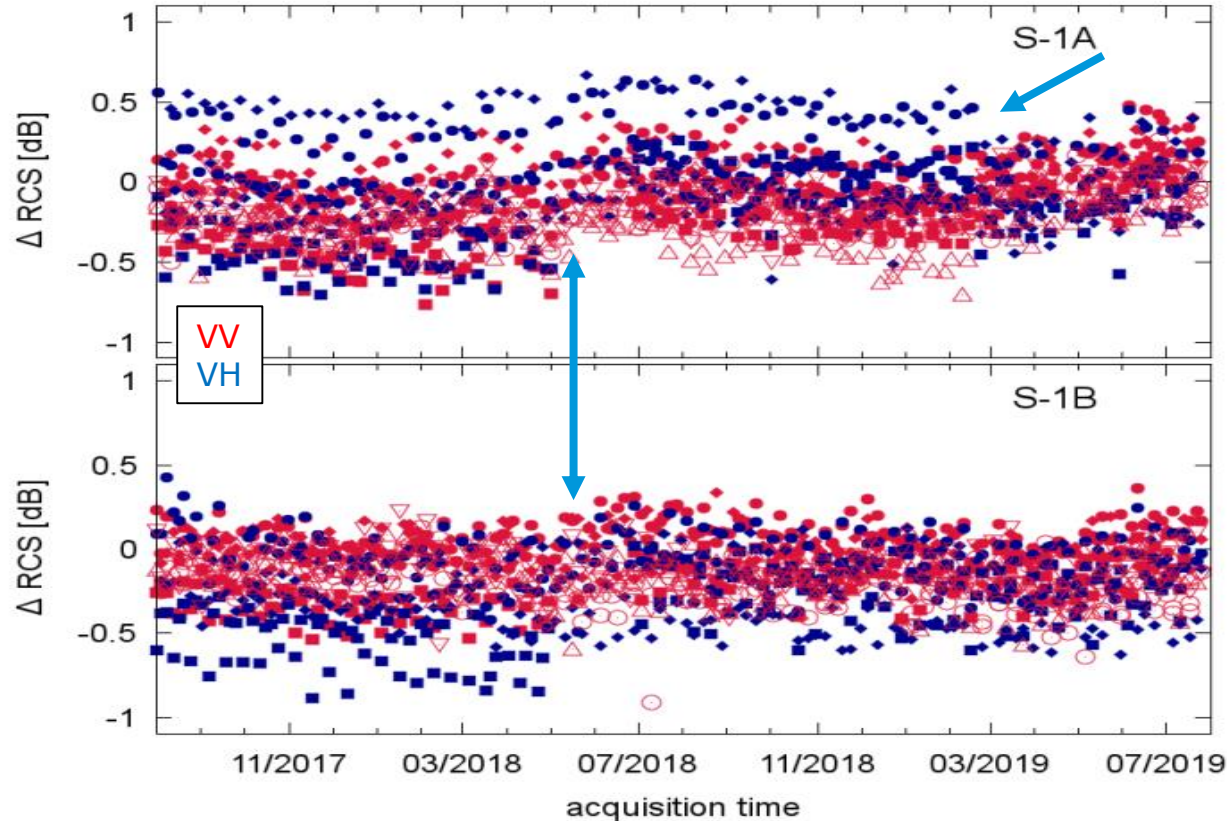

# Sentinel-1 Total Zero Doppler Steering improvement

- Long AOCS optimisation campaign put in place to support the RVL retrieval
- As a result, the Doppler centroid frequency stability is below 10Hz!
- Unprecedented for a SAR mission

# Radiometric accuracy

- Measurement over DLR target over the last two years
- Very stable RCS over time
- Changes related to transponder maintenance
- Improvement of EAP
- Seasonal fluctuations

	S-1A RCS [dB] ( $\mu \pm \sigma$ )	S-1B RCS [dB] ( $\mu \pm \sigma$ )
VV	-0.19 ± 0.21	-0.11 ± 0.17
VH	-0.03 ± 0.33	-0.24 ± 0.26

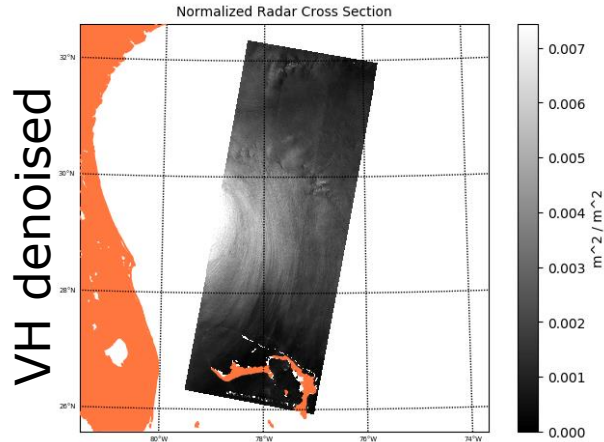

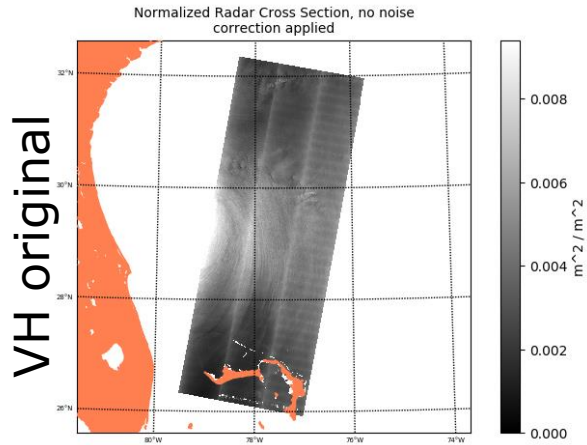

# Improve radiometric accuracy under presence of noise

Normalized Radar Cross Section, no noise correction applied

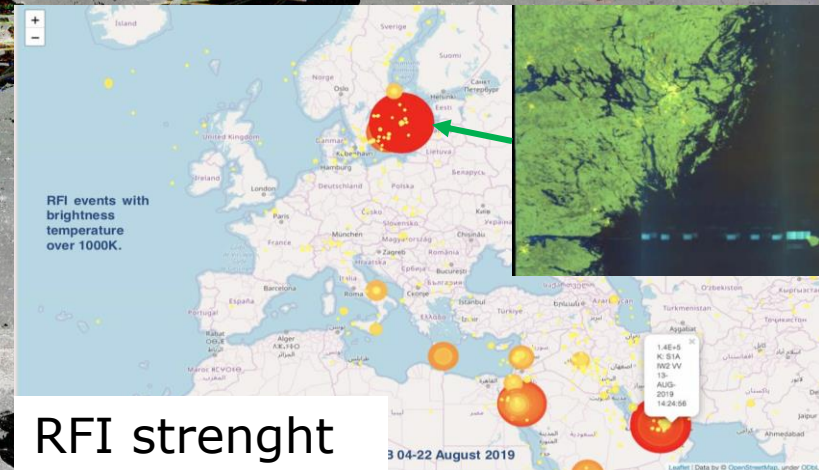

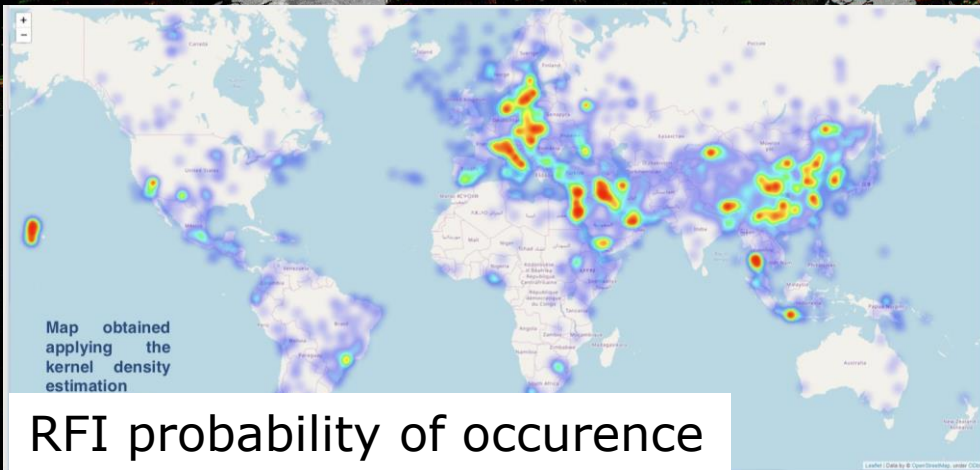

- Improving the sensor NESZ characterisation
- Reviewing the noise handling in the SAR processor
- Tracking the noise power evolution over the data-take

# Improve radiometric accuracy under presence of noise

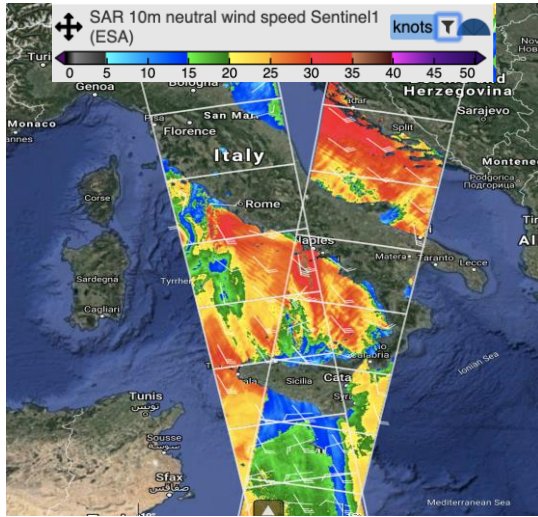

# Interferences at C-band

- RFI has been reported as the major source of disturbance.
- Using noise power globally it is possible to estimate probability and strenght of occurrence
- S-1 processor will be updated to mitigate RFIs

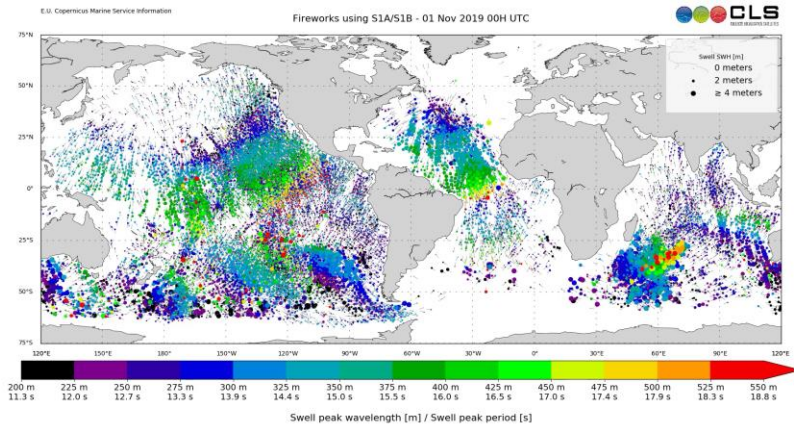

# Also Level-2 products

- Sentinel-1 is the unique mission providing **validated** ocean geophysical variables for operational services (wind and swell)

- Wind product will be soon update to perform inversion using the cross-pol benefiting for all the efforts made on the noise removal

- Global swell information is assimilated since 2018 in operational weather forecast model.

# Taking home messages

- Sentinel-1 A/B satellites are both in very good shape. Sentinel-1 A is approaching the expected 7y lifetime with no performance degradation
- Sentinel-1 is a unique asset providing systematically global calibrated data over land masses and open oceans allowing to build up very dense time series
- The data quality is being constantly improved through as a result of constant effort in calibration, geophysical validation, algorithm evolutions or changes at spacecraft level
- The outstanding spacecraft, the systematic production, the quality of the data and the free and open data policy makes S-1 a game changer in all domains.
