## Abstract

1. Requirements of EDAP Task 5
2. DEMs to be controlled: SRTM / ASTER GDEM / ALOS Word 3D / Copernicus DEM
3. Statistical assessment
  - 3.1 Intercomparison of DEM - On-the-fly reprojection / difference / 8-bits rendering
  - 3.2 Elevation control - ICESat LiDAR reference data
  - 3.3 Analysis of errors - global / regional / altitud-dependent / roughness-dependent
4. Use-based assessment
  - 4.1 Sentinel-1 orthorectification
  - 4.2 Envisat / MERIS FRS orthorectification
5. Towards a DEM intercalibration platform
  - 5.1 Vertical reference data - LiDAR, geodetic points, altimeter data...
  - 5.2 Vertical reference grids - DEMs, geoid data
  - 5.3 Display tools - On-the-fly param. like resampling methods, hypso.LUTs, shadowings...
  - 5.4 Interactive control tools - sharing of residual maps, dynamic control reports...
  - 5.5 Geomorphological analysis tools - Density of local extrema / saddle points, characteristical lines (ridges, thalwegs), watershed trees... dynamic comparison

**Keywords** - Digital Elevation Model (DEM)
