

Sea Ice, Climate Change and Remote Sensing

Prof. David Barber
Canada Research Chair in Arctic System Science
Director, Centre for Earth Observation Science
University of Manitoba
Winnipeg, MB. Canada

www.umanitoba.ca/ceos

ESA Summer School, August, 2006

Lecture outline

- 1) Arctic Climate Change and Remote Sensing
- 2) Geophysics, dielectrics and thermodynamics
- 3) Scattering and emission modeling

Outline of this talk

- Sea ice
- Climate Change
- Overview of remote sensing applications
- Conclusions

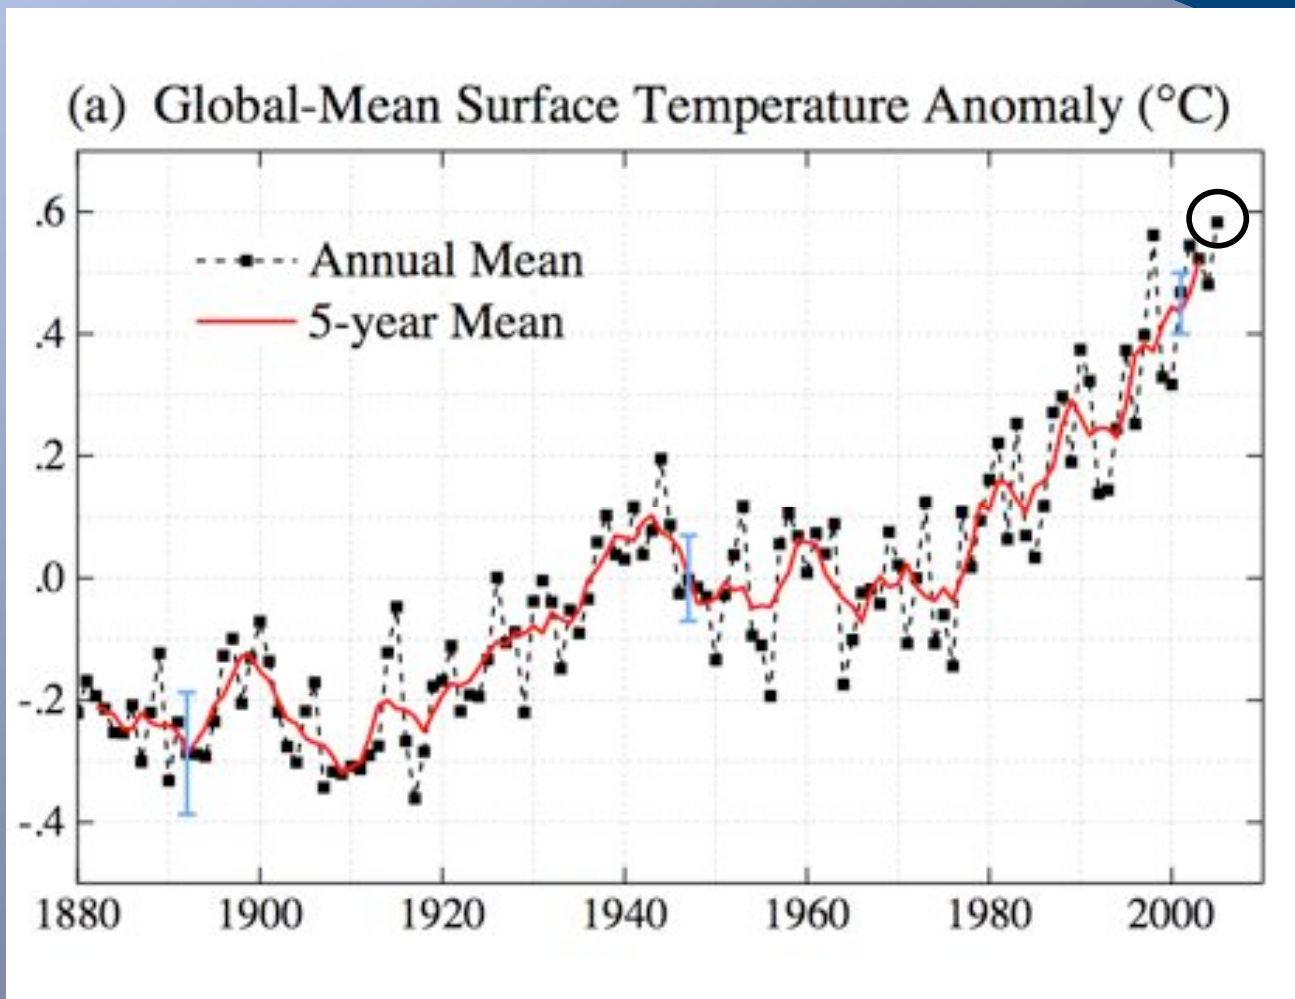

A survey

- Do you believe climate change is real?
- Have you heard about the changes going on in the Arctic?
- Have you ever been to either pole of our planet?

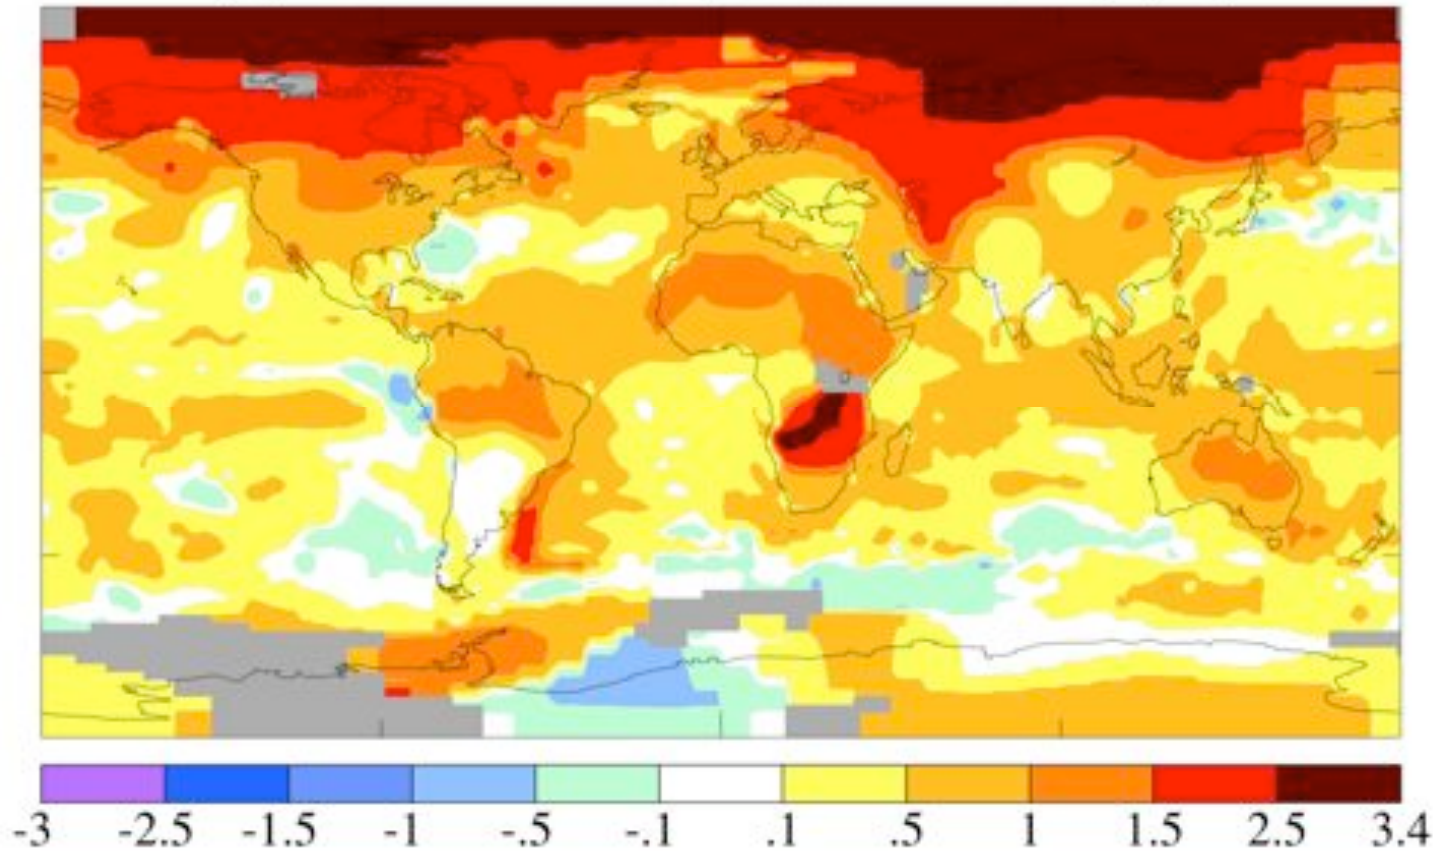

Global mean surface temperature anomalies
relative to the 1951-1980 climatology
(2σ error bars in blue)

Hansen et al. 2006

(b) 2005 Surface Temperature Anomaly ($^{\circ}\text{C}$)

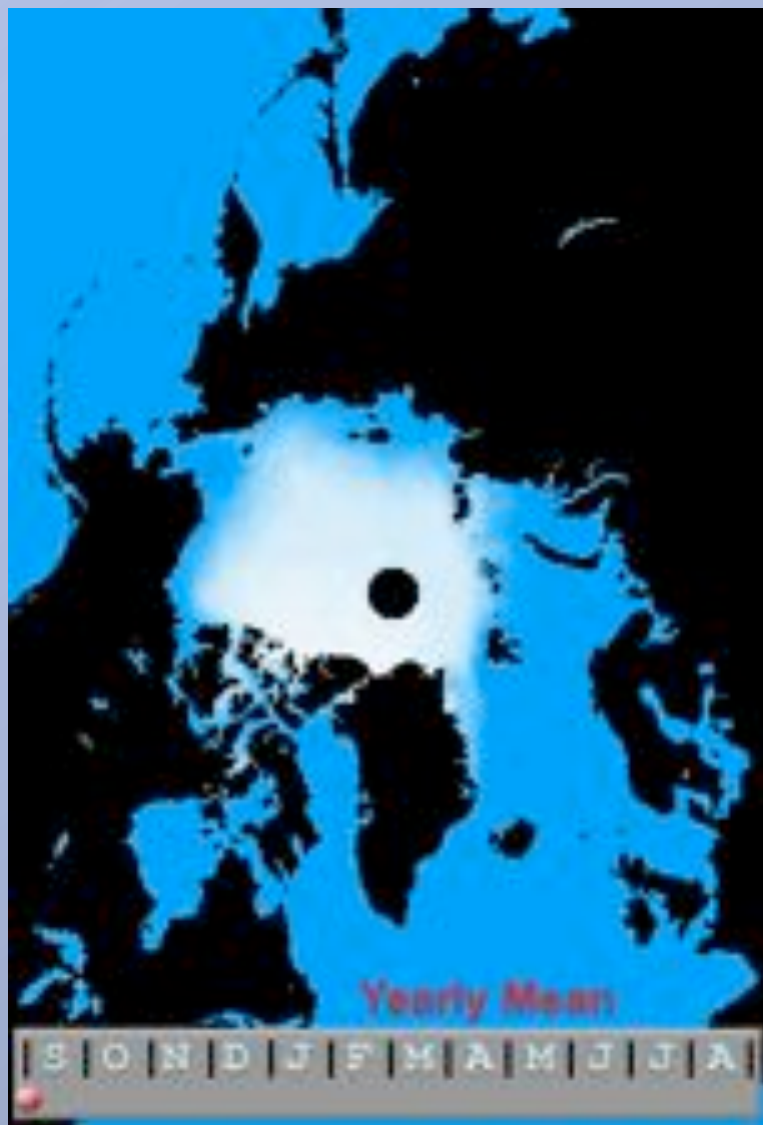

Global mean surface temperature anomalies
relative to the 1951-1980 climatology

Hansen et al. 2006

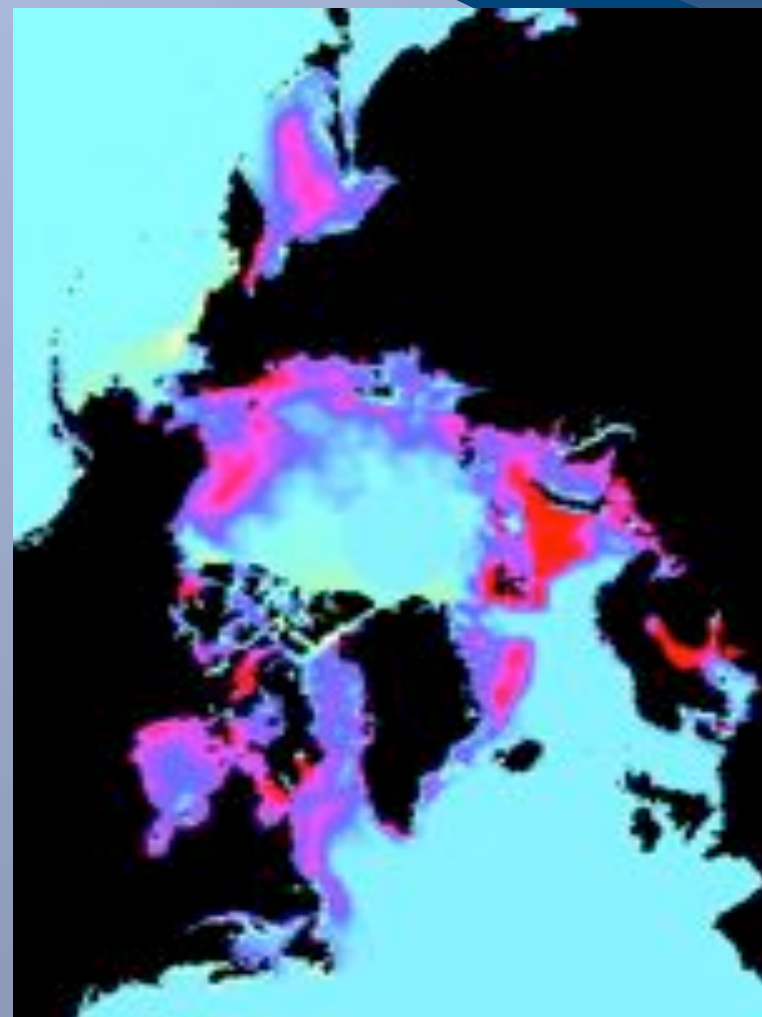

The Warming Arctic

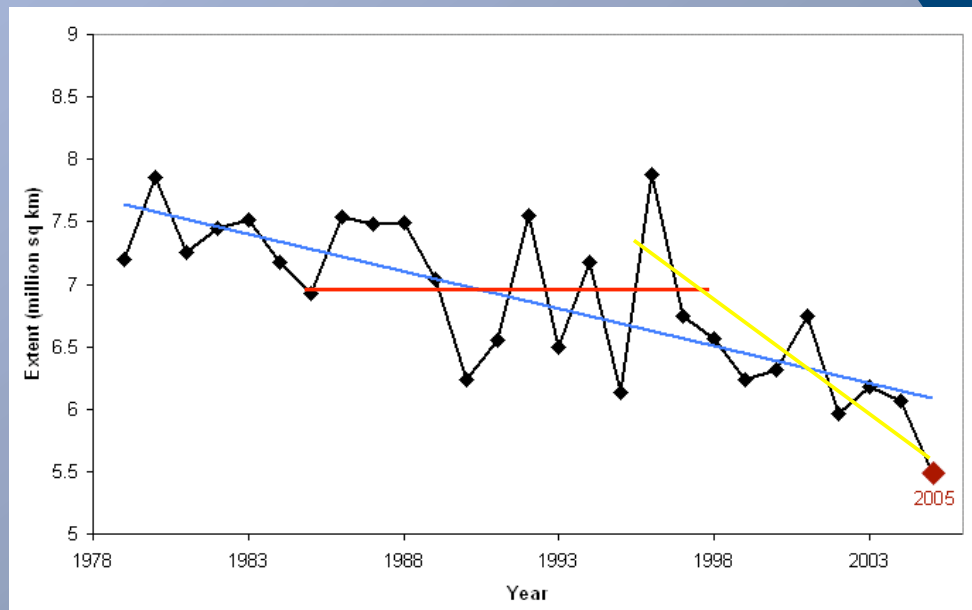

Growth and Decay of Sea Ice

Rate of Change $\delta\%$ ($P < 0.01$)

Reduction in the sea ice minimum

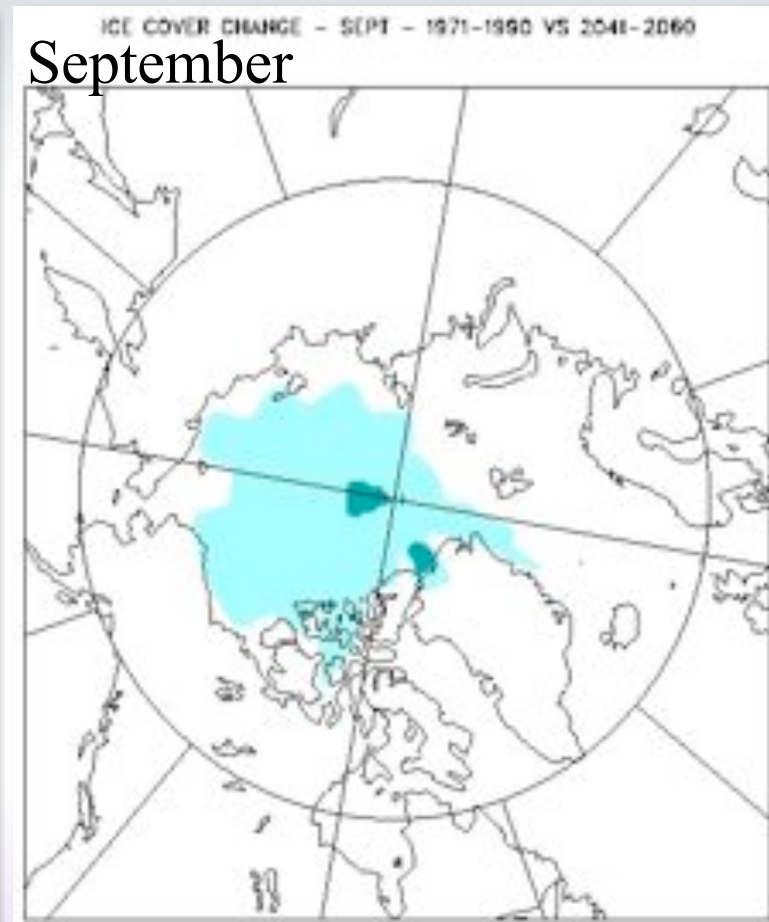

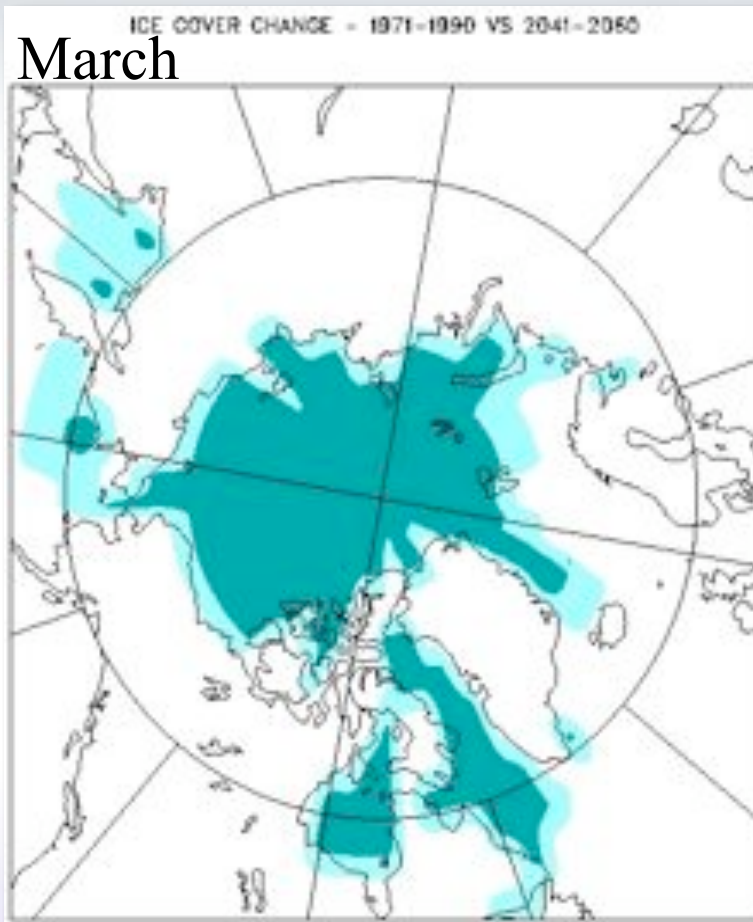

We are loosing a lot of sea ice

70,000 km² per year or 2.2M km² over 30 years

Seasonally ice free around 2050!!

The Future?

G. Flato, CCMA

Geopolitical Response?

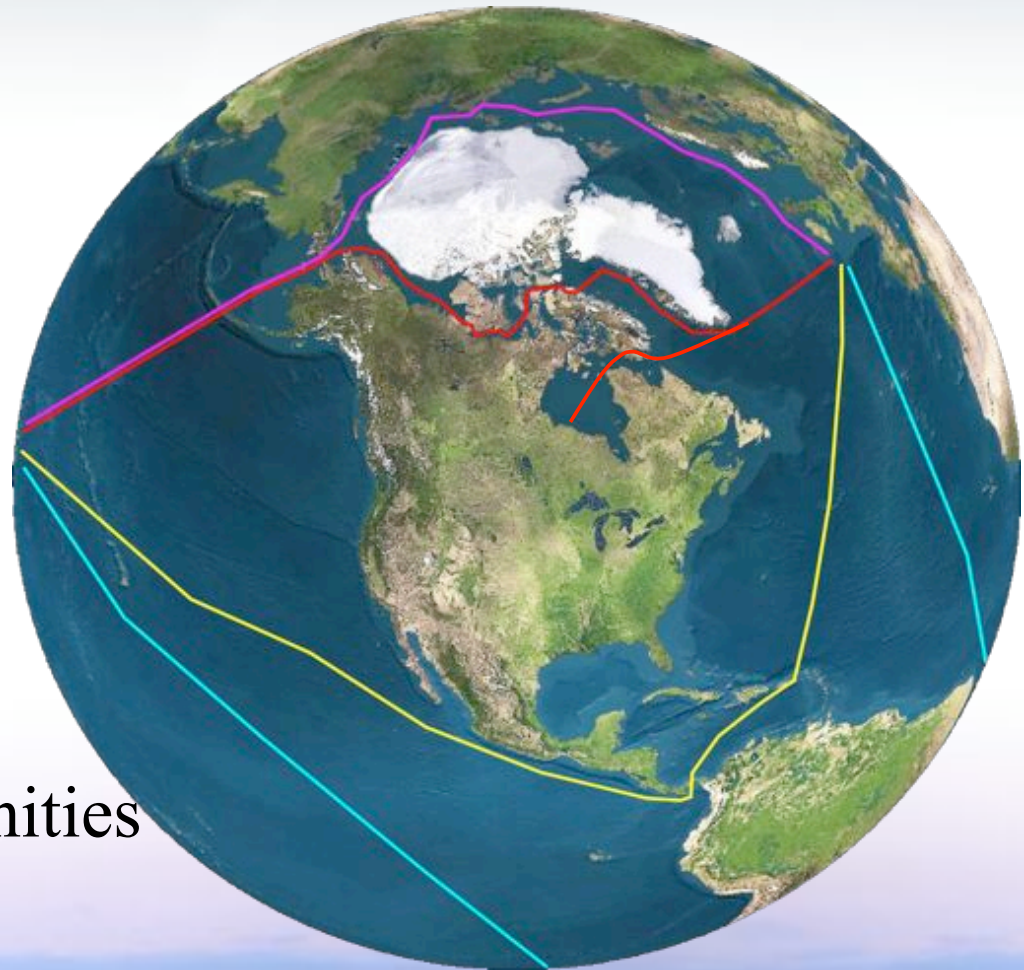

A new ocean to navigate, exploit and preserve

NW Passage —

NE Passage —

Panama
(+ 11 000 km)

Cape Horn —
(+ 19 000 km)

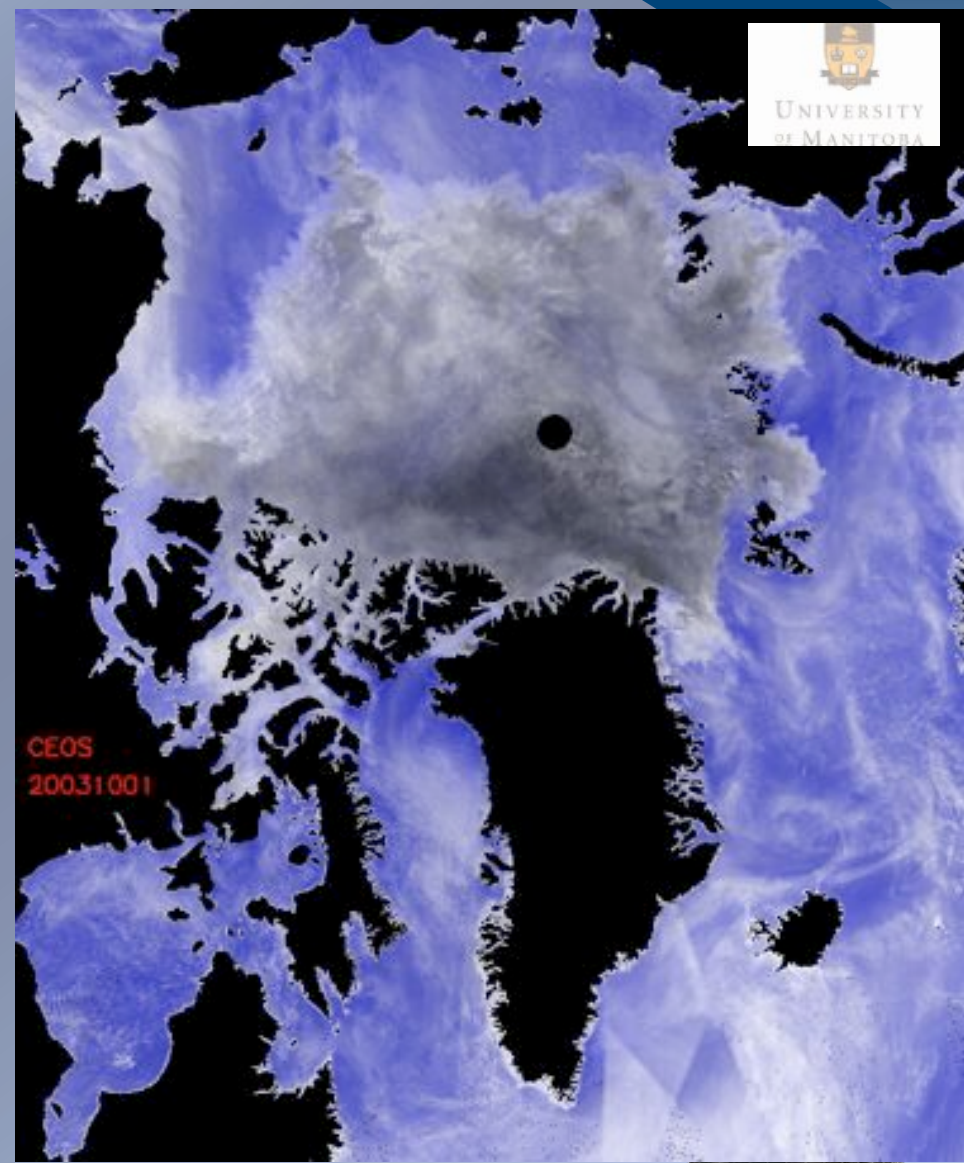

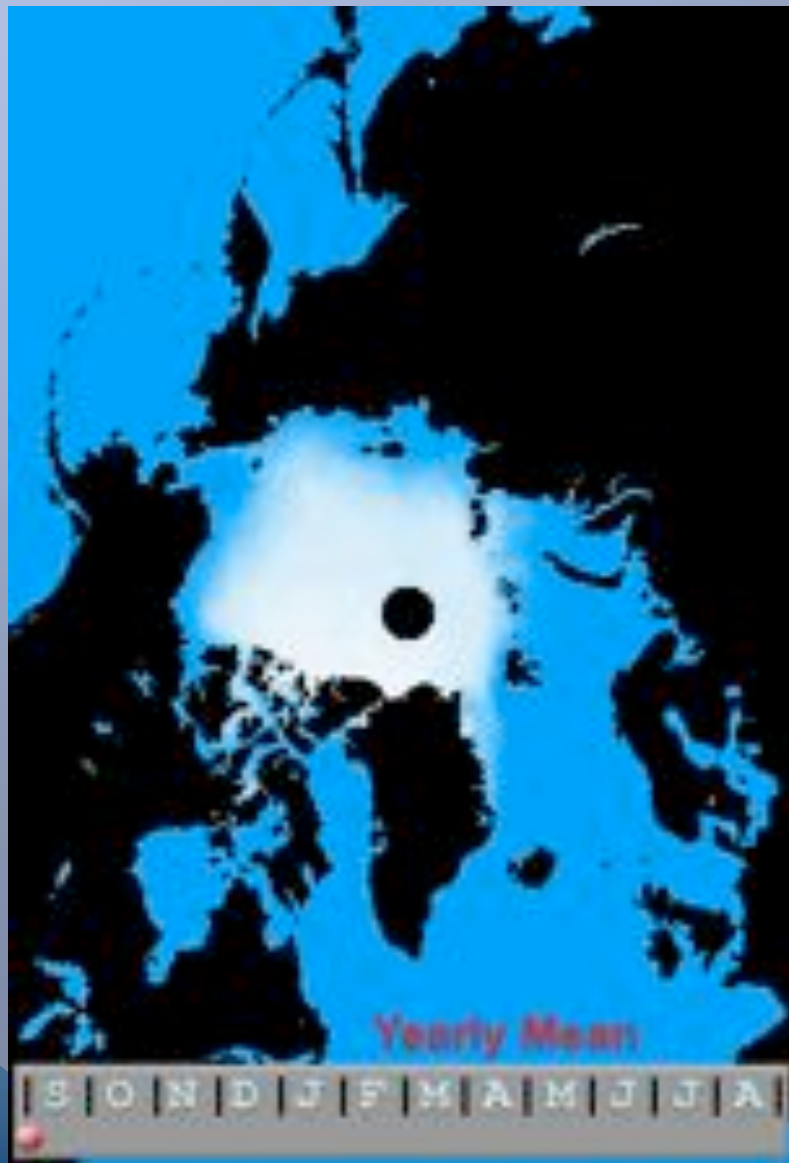

Challenges and Opportunities

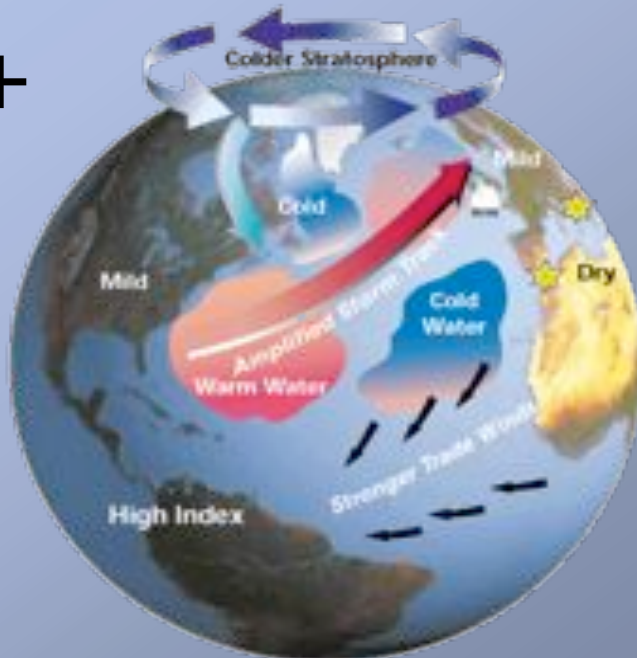

Drivers

+

The Arctic Oscillation (AO)

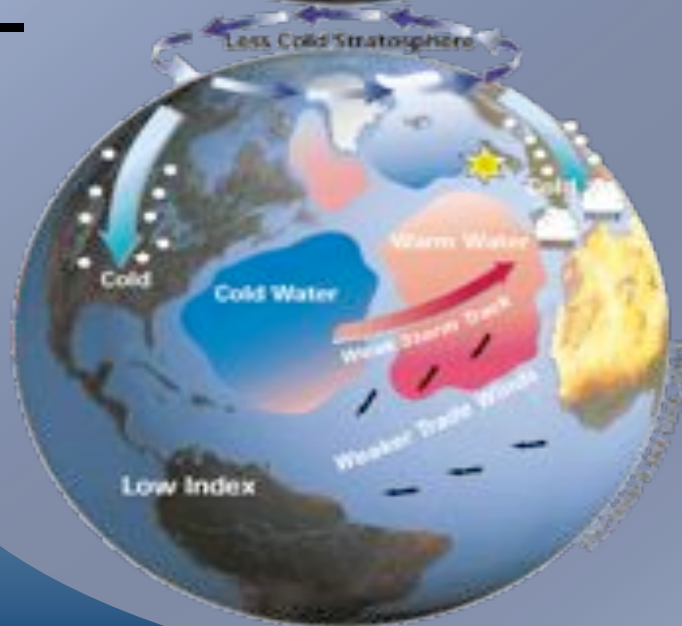

+ low press over the pole

+ high press mid lat

- high press over the pole

- low press mid lat

-

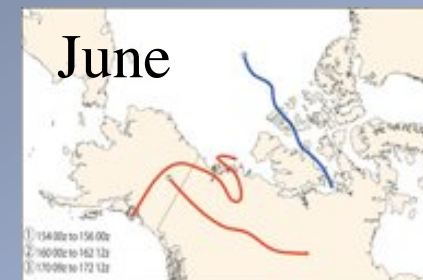

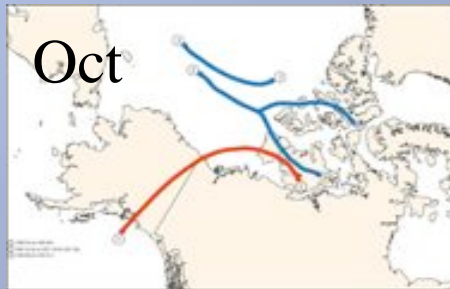

controls storm tracks, moisture,
etc

Connection between the
stratosphere-troposphere and
surface

(Lukovich and Barber, 2005)

Cyclone Forcing

Cyclone frequency and trajectory (CASES'04)
What is the effect of wind forcing on the surface?

Fisico and Hanesiak, 2006

Changes in Atlantic water (depth and temperature)

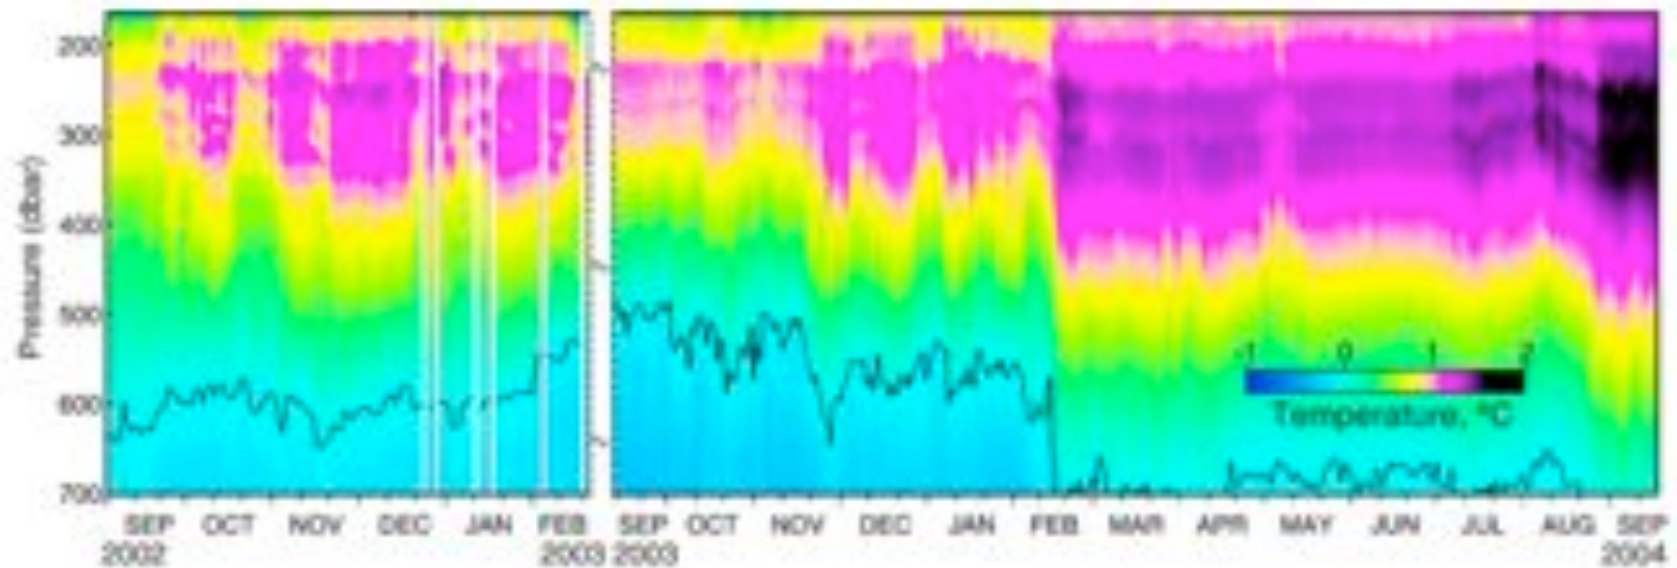

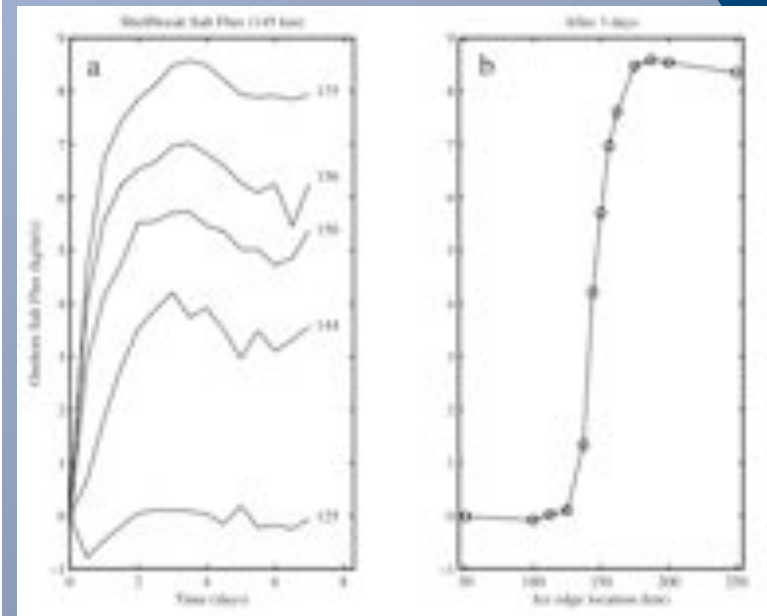

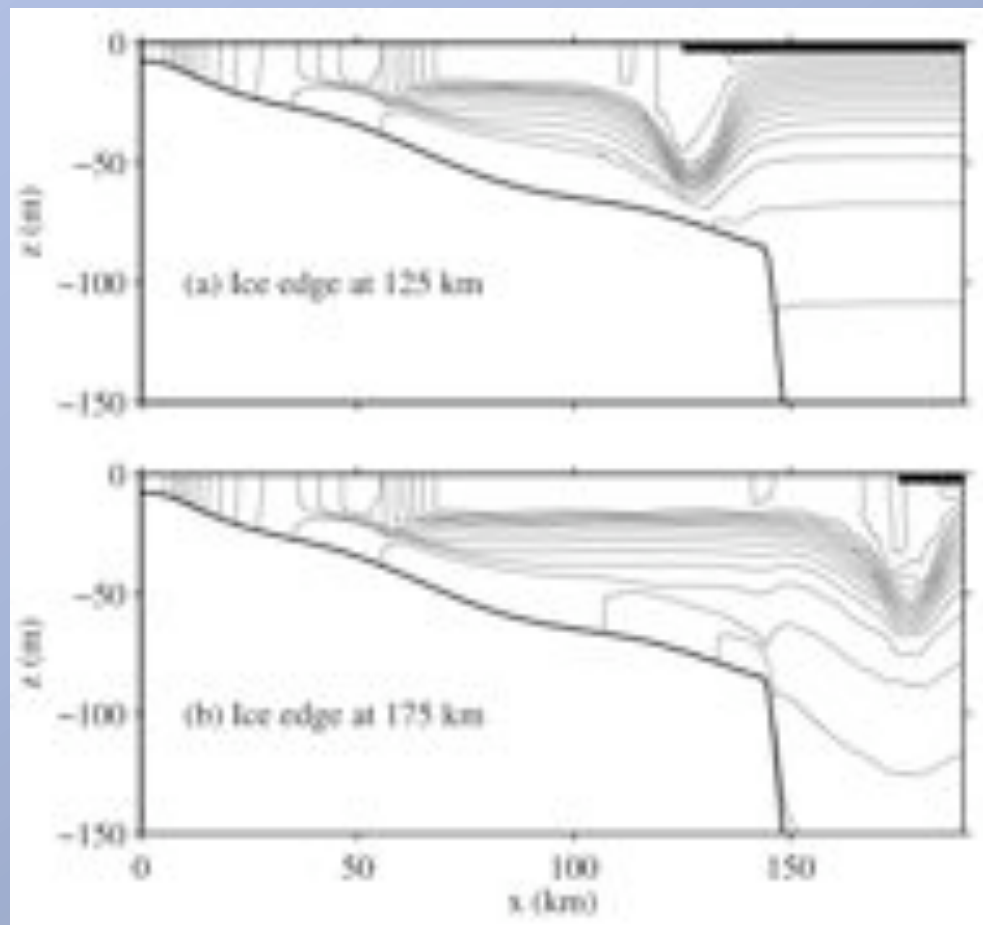

Fig. 3. Water temperature from the MMP profiles. The 0°C isotherm (black line) traces the lower boundary of the AW layer. Blank areas represent missing data. 10-m vertical binning is used.

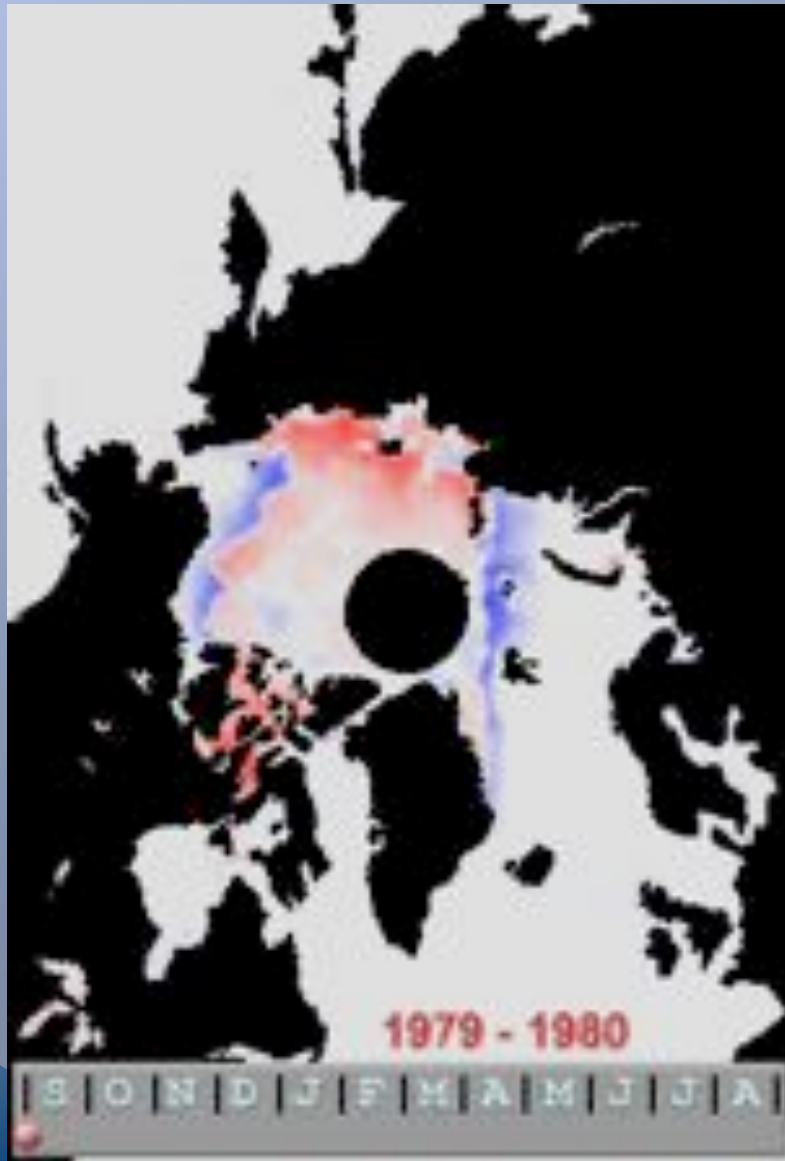

Ocean-sea ice-atmosphere coupling at the shelf break

Carmack and Chapman 2003

The ice-albedo feedback mechanism (thermodynamic)

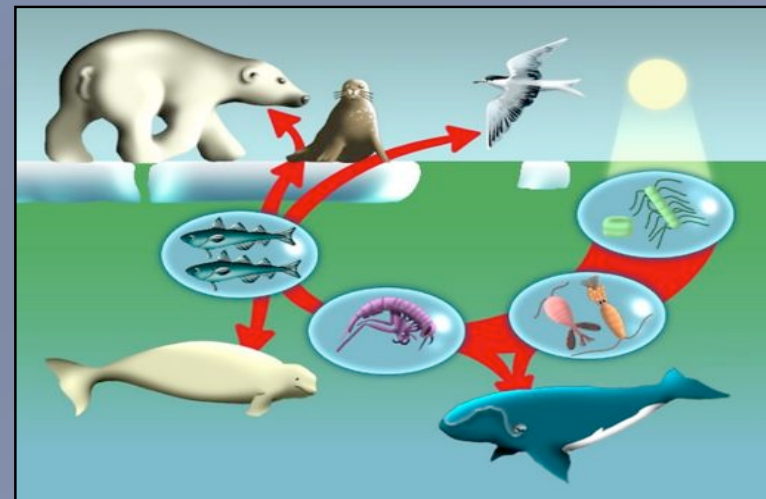

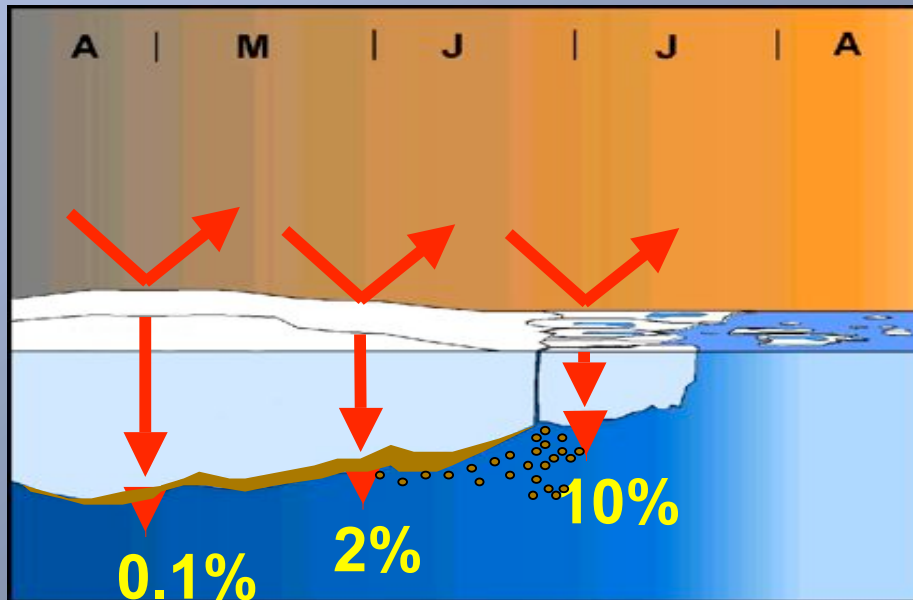

Positive feedback as more ocean absorbs shortwave radiation.

Complications with longwave flux

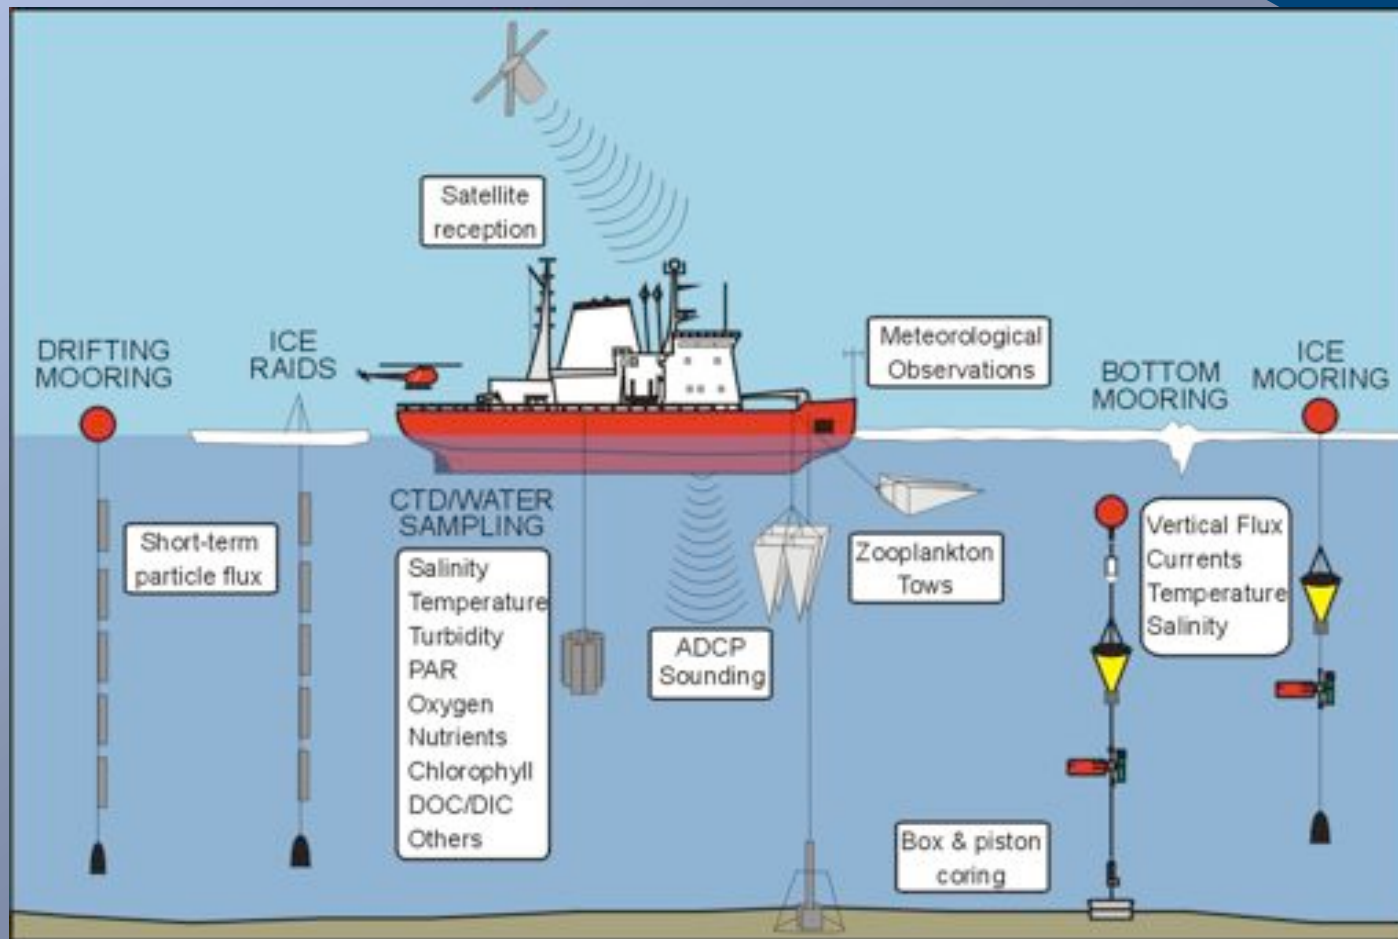

Physical-Biological Coupling

- Process Studies
- Modelling Studies
- Scaling Studies
- Ocean-sea ice-atmosphere
- Bio-physical
- Contaminants

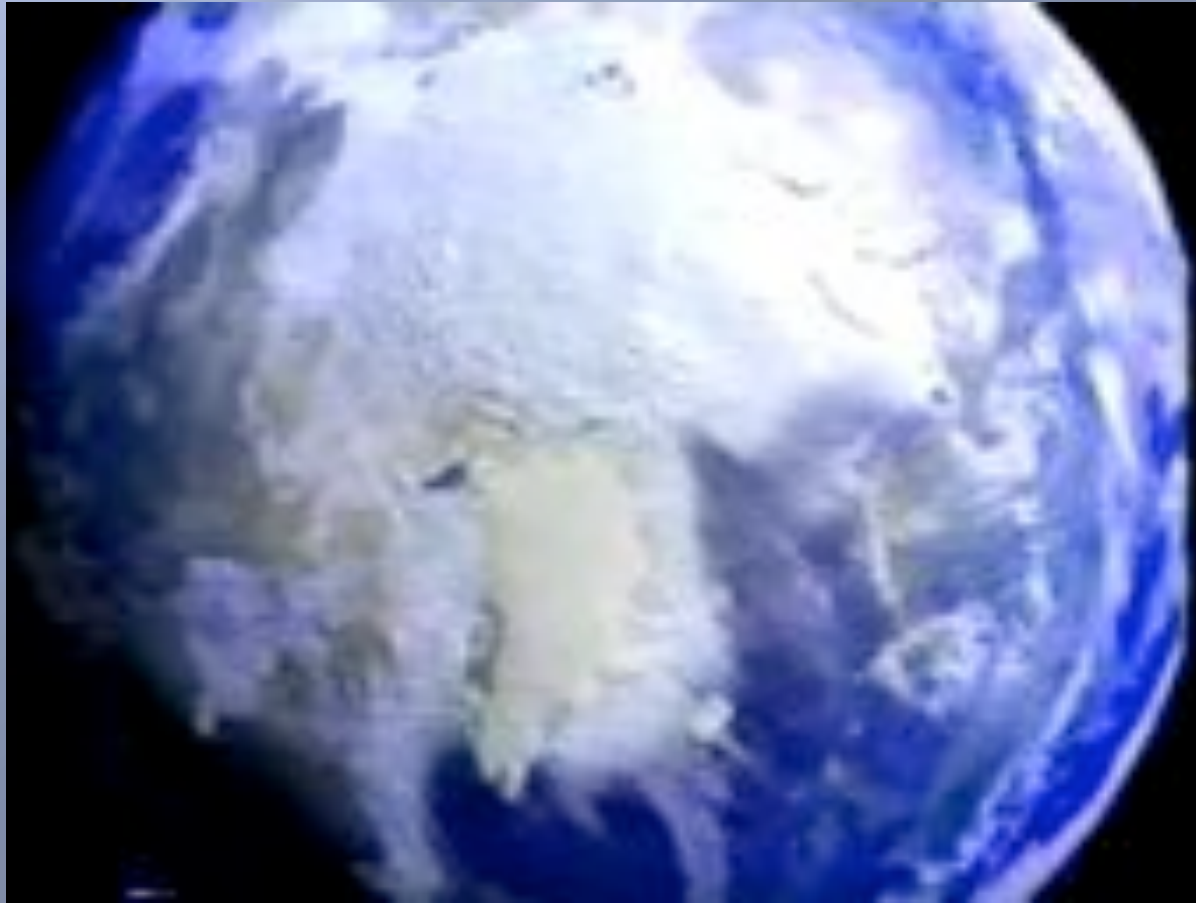

How we conduct Arctic Science

How we conduct Arctic Science

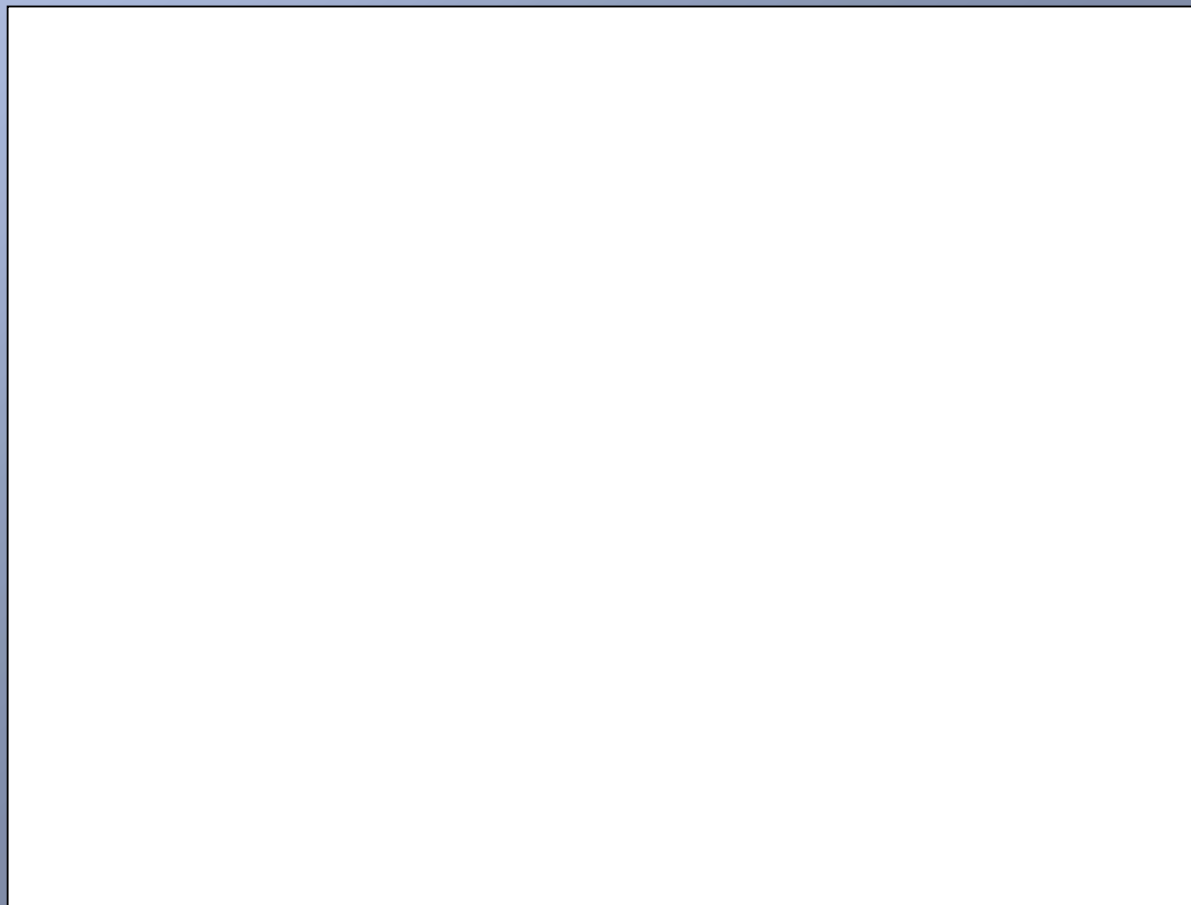

Remote Sensing

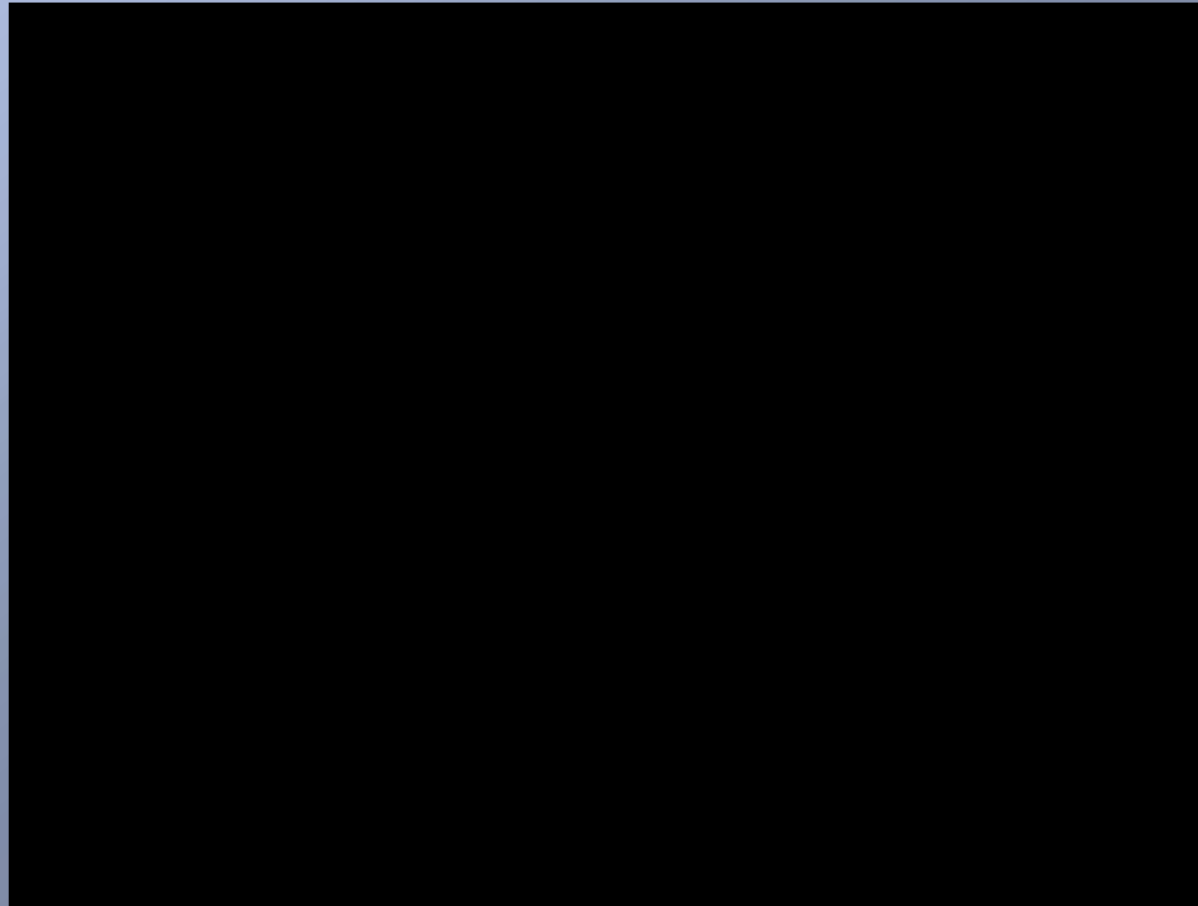

Shuttle window (ideal case)

Shuttle window (summer)

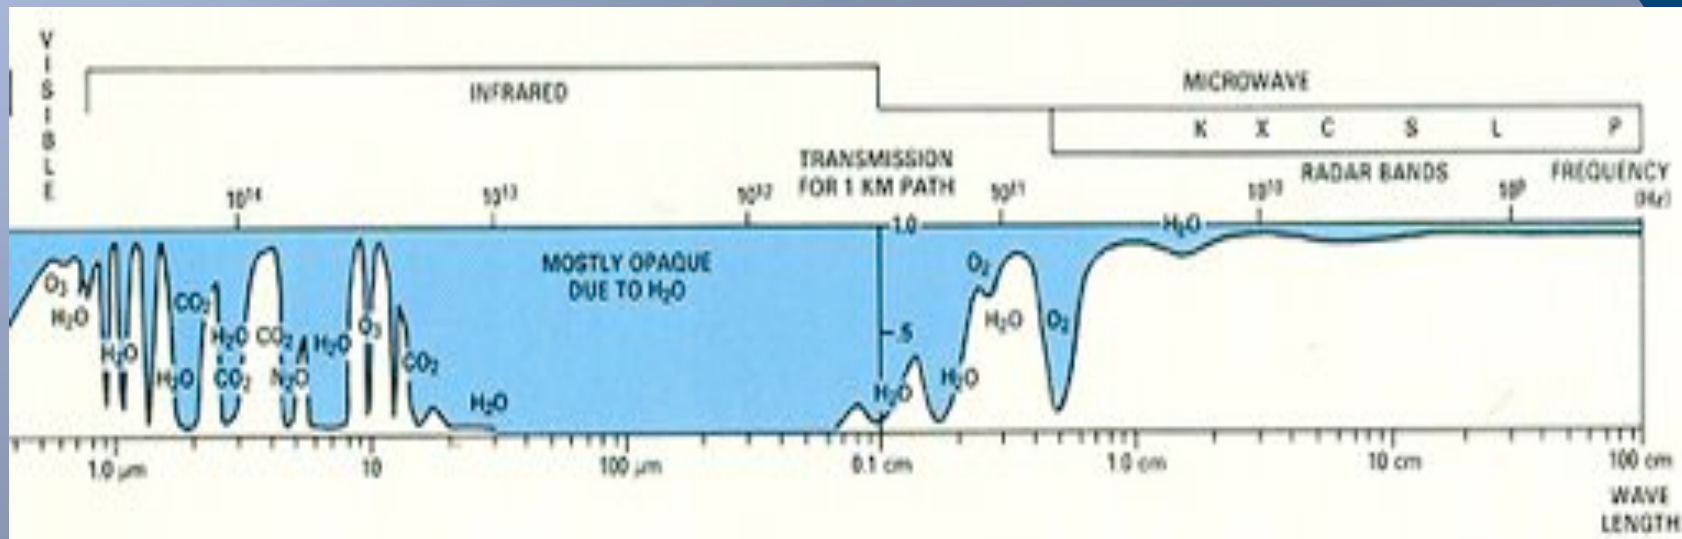

Shuttle window (winter)

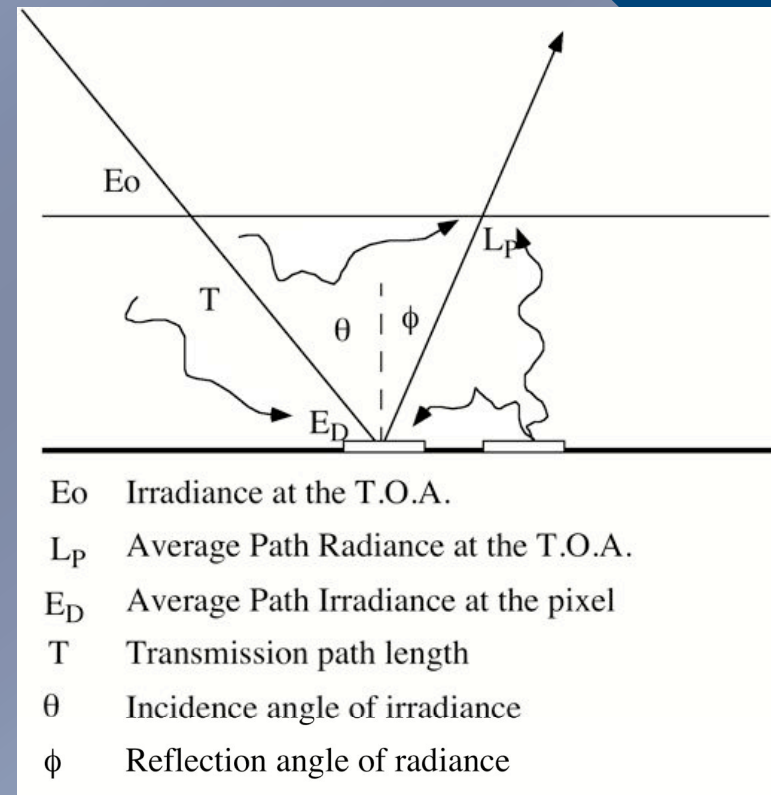

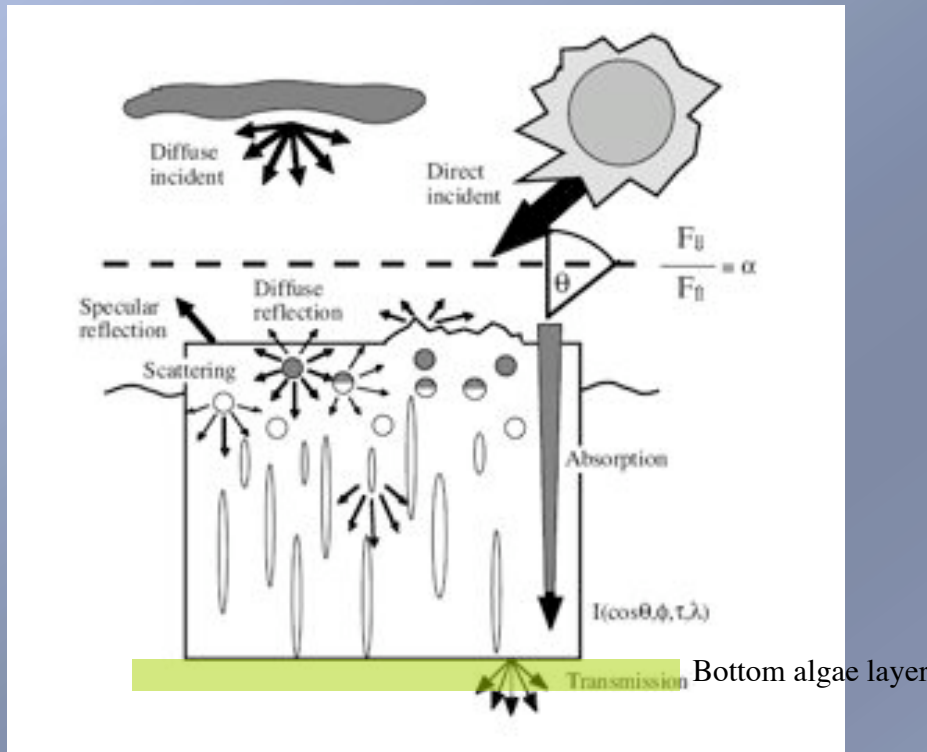

Atmospheric Transmission and EMI

$$E_I(\lambda) = E_R(\lambda) + E_A(\lambda) + E_T(\lambda)$$

EM interactions and Sea ice

$$E_I(\lambda) = E_R(\lambda) + E_A(\lambda) + E_T(\lambda)$$

RS measures the $E_R(\lambda)$

Extraction of Information

- Geophysical Inversion

$$DN = W \cdot m^{-2} \cdot st^{-1}$$

$$Q^* = K^* + L^*$$

$$TSS = \alpha + \beta K^* + \epsilon i$$

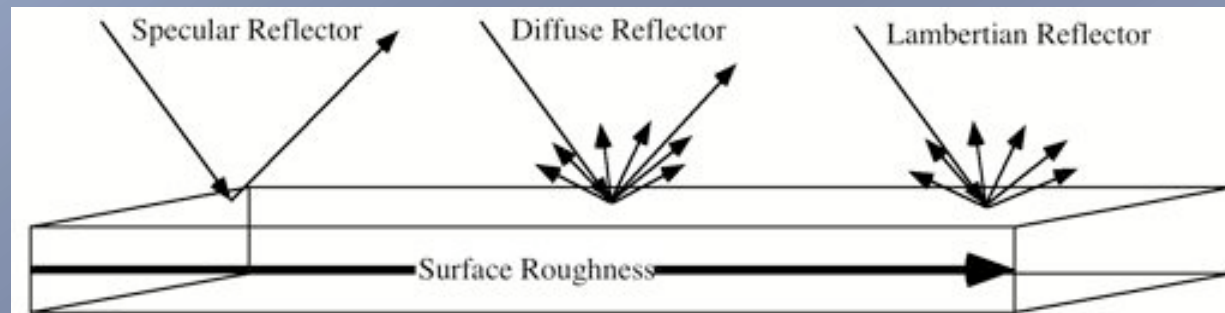

$$DN = {}^\circ K_r$$

$${}^\circ K_k = \sigma \epsilon {}^\circ K_r$$

$$L^* = \epsilon {}^\circ K_{r\downarrow} - \epsilon {}^\circ K_{r\uparrow}$$

Data Characteristics

- Surface Scattering

$$\sigma < \frac{\lambda}{32 \cos \theta}$$

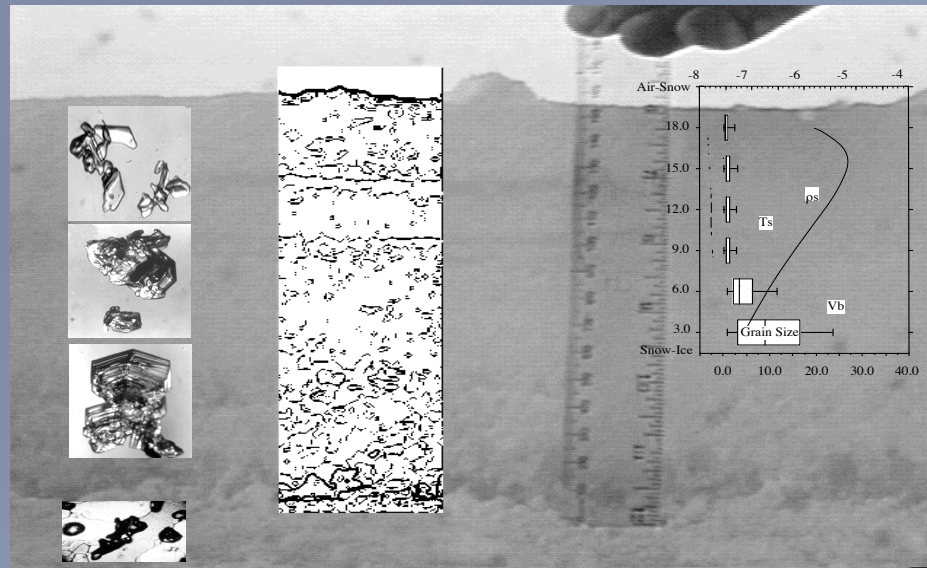

RMS height
Correlation length

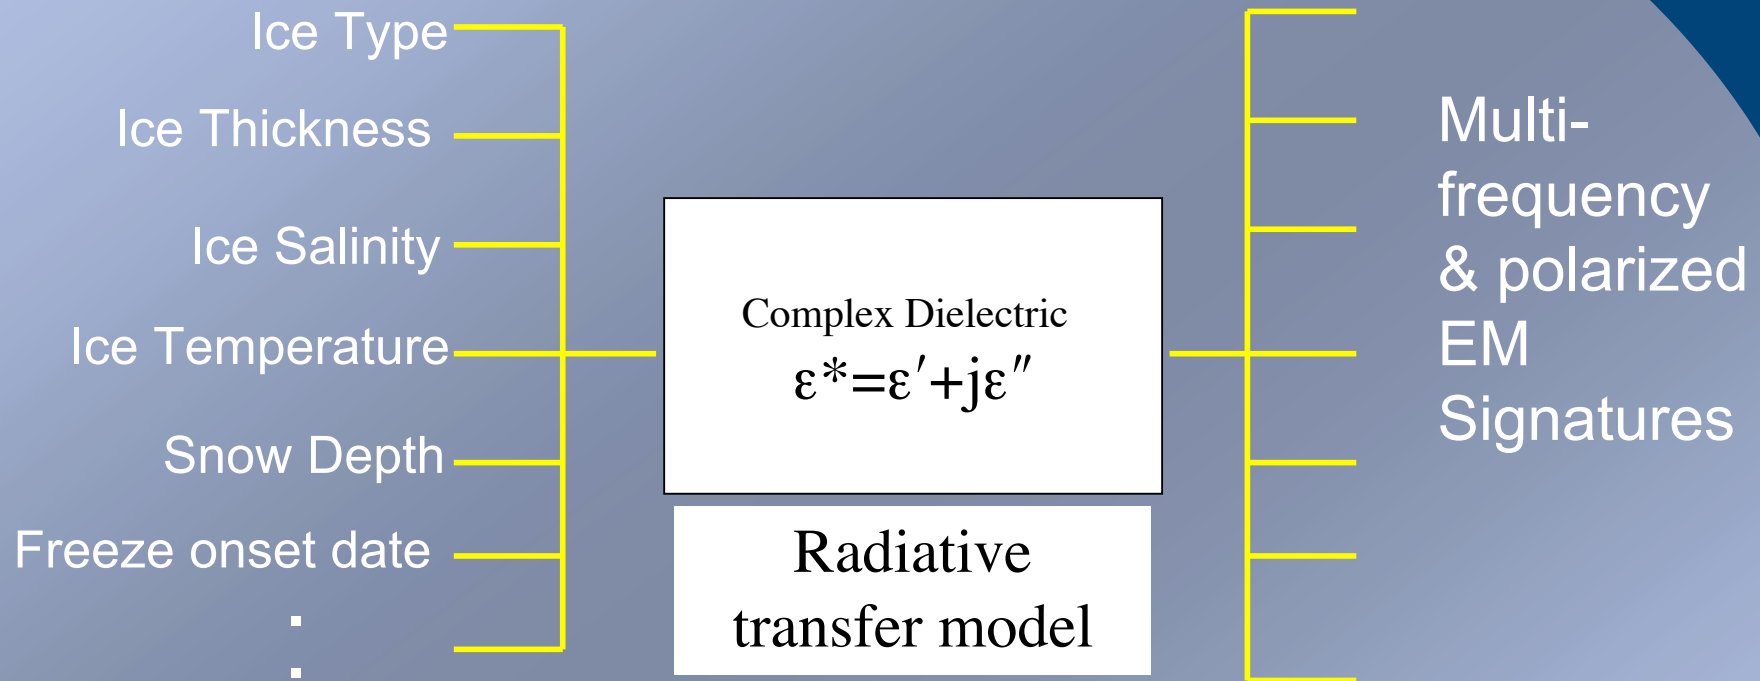

Data Characteristics

- Volume Scattering

Number density
Volume fraction
Scattering physics

Forward Approach

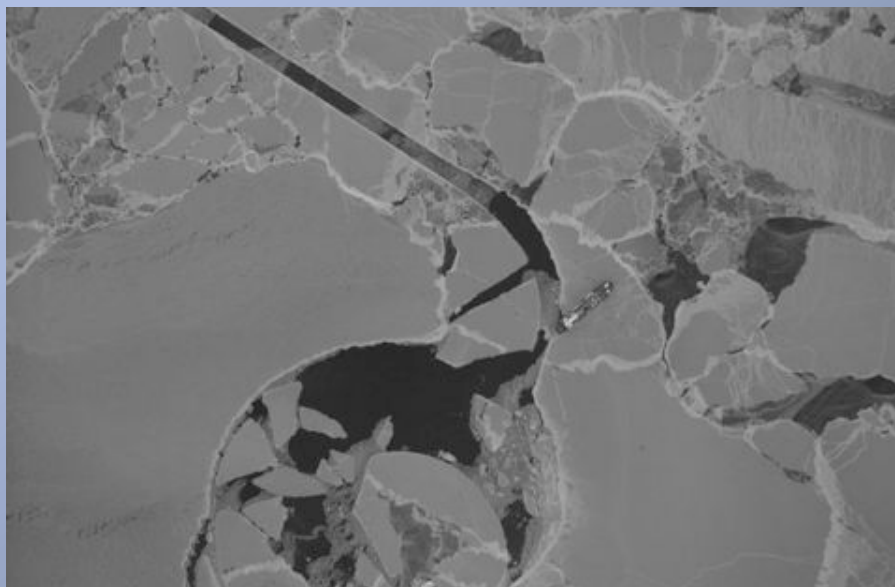

Inverse Approach

Applications

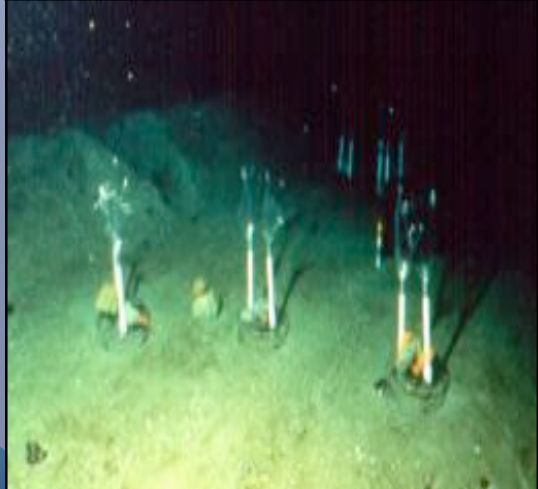

Snow/Sea Ice Geophysics

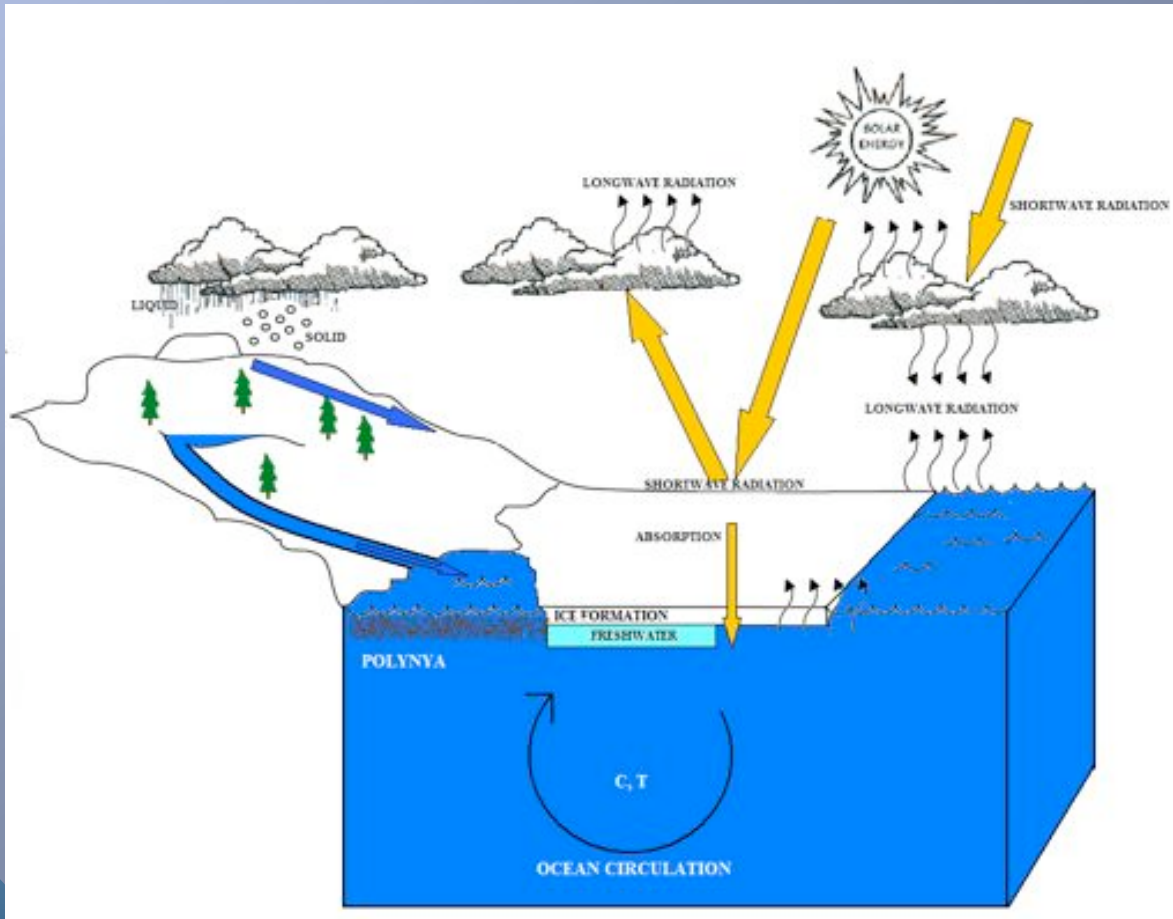

Ocean/Atmosphere

Biology

Process Studies

Processes of Interest

Energy cycle

Water cycle

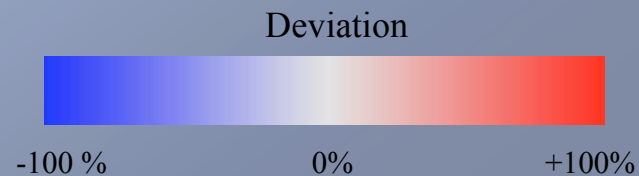

Freshwater-marine coupling

Combine *in situ*, RS data and modelling

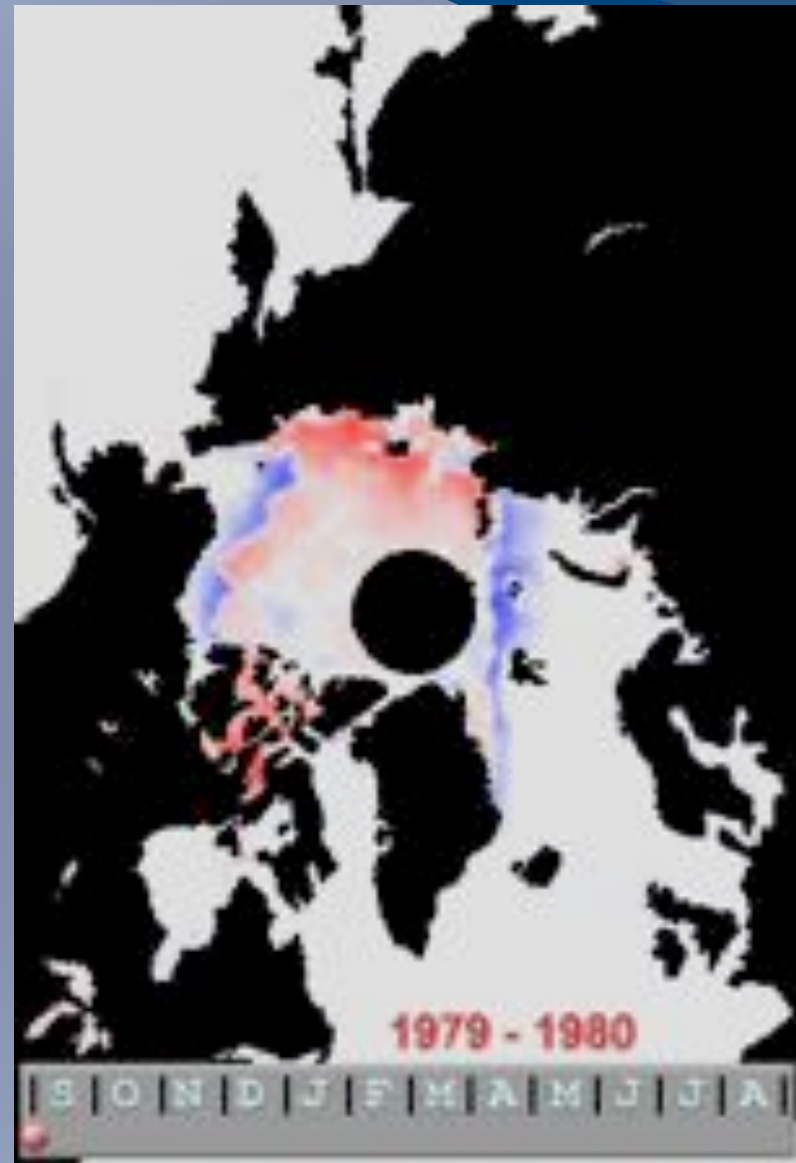

Sea ice concentration anomalies (1978-2006)

$$W_{kij} - \sum \frac{W_{kij}}{n}$$

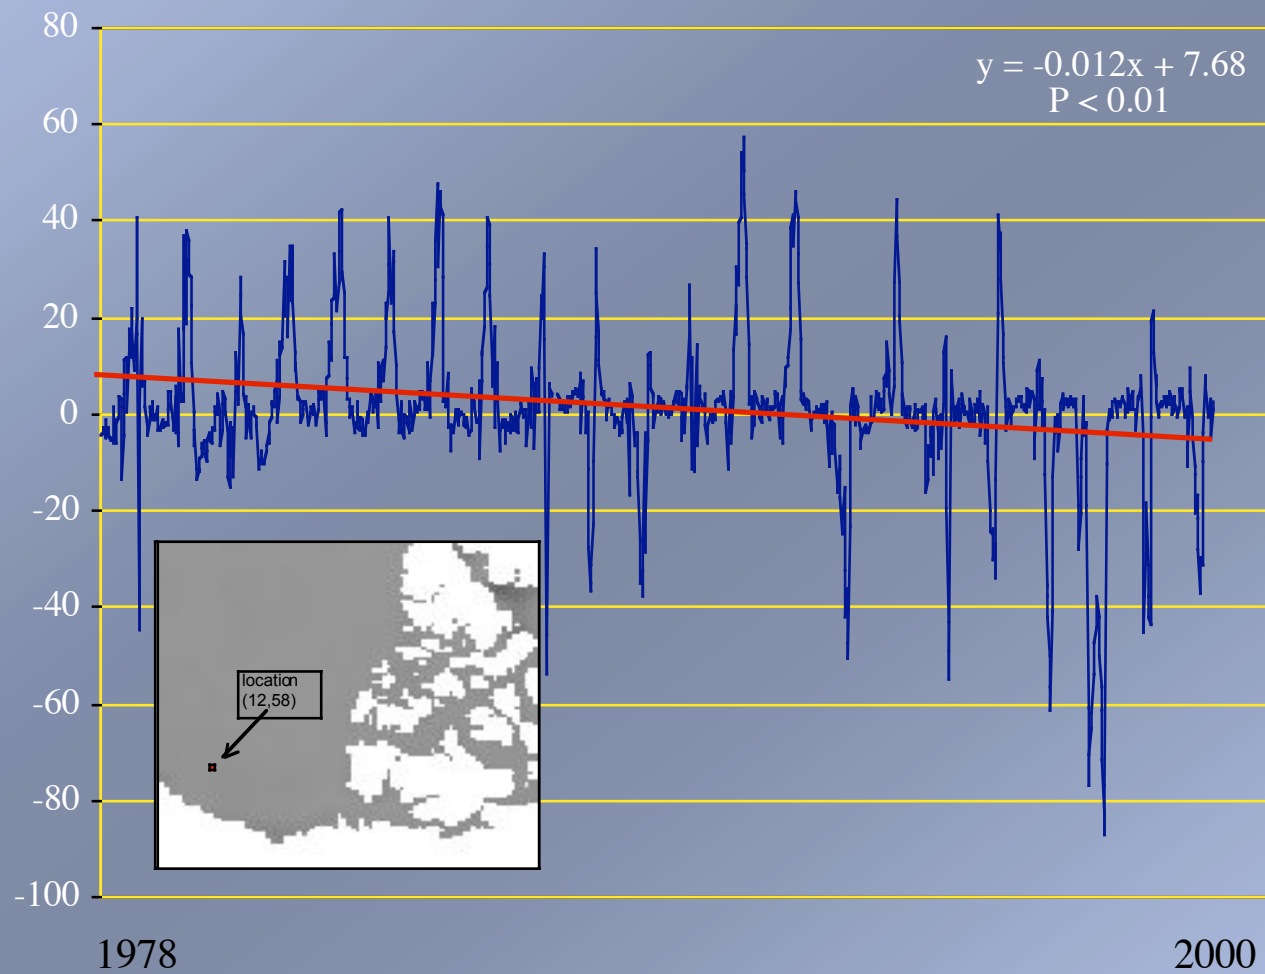

What drives the coherence?

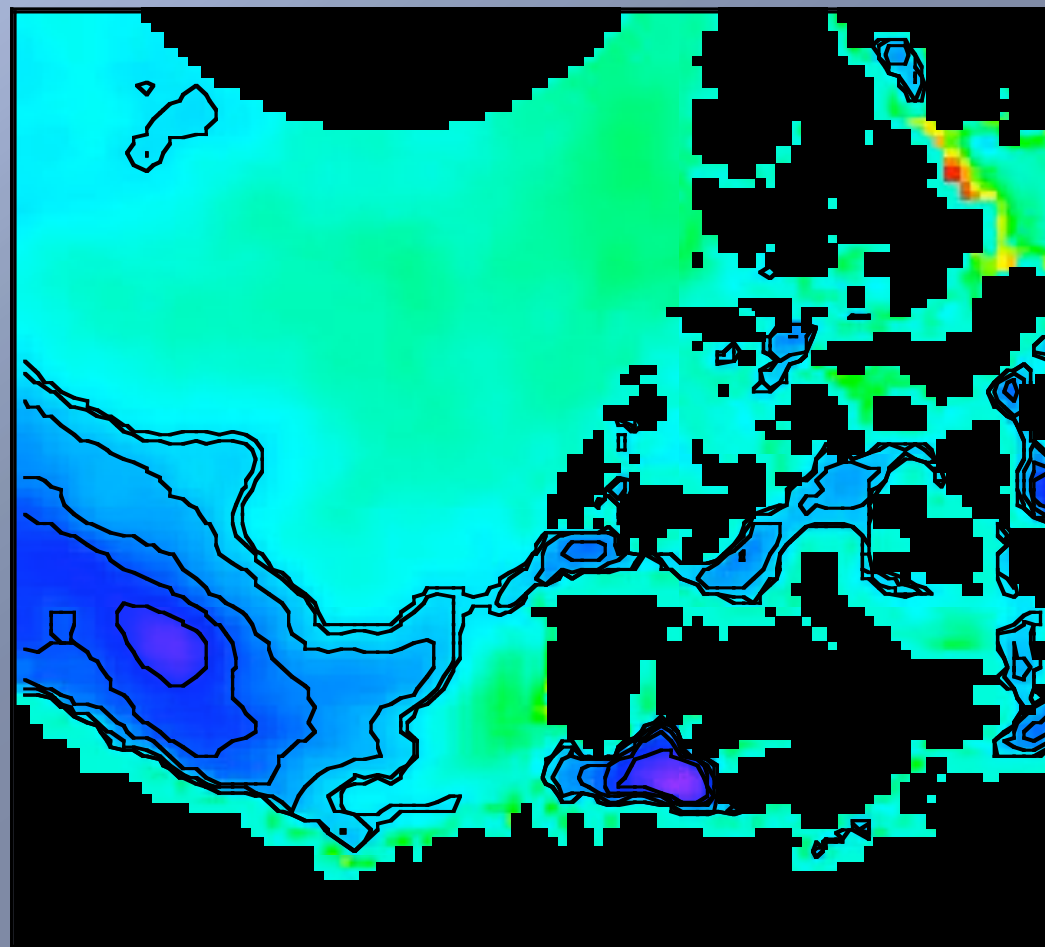

1979-2001 weekly animation at www.umanitoba.ca/ceos

CEOS

Periodicities and trends in the Anomalies?

Slopes in ∂ij (1978-2001)

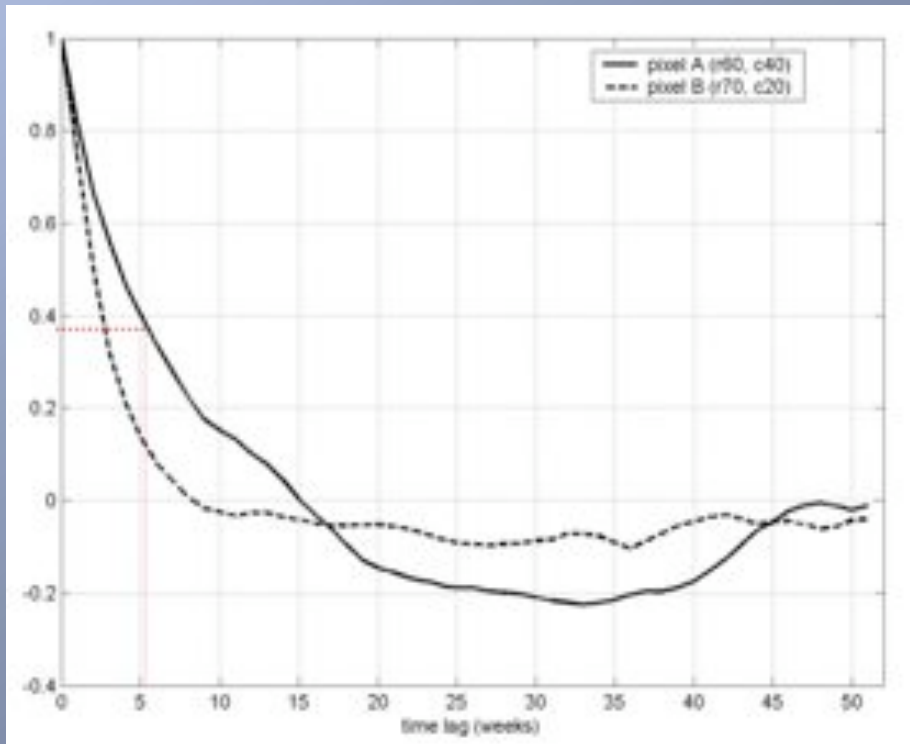

Pos

$P < 0.01$

Neg

Temporal autocorrelation functions and e-folding times

$$R(\tau) = \frac{\langle (\phi(\tau) - \langle \phi \rangle)(\phi(t + \tau) - \langle \phi \rangle) \rangle}{\langle (\phi(t) - \langle \phi \rangle)^2 \rangle}$$

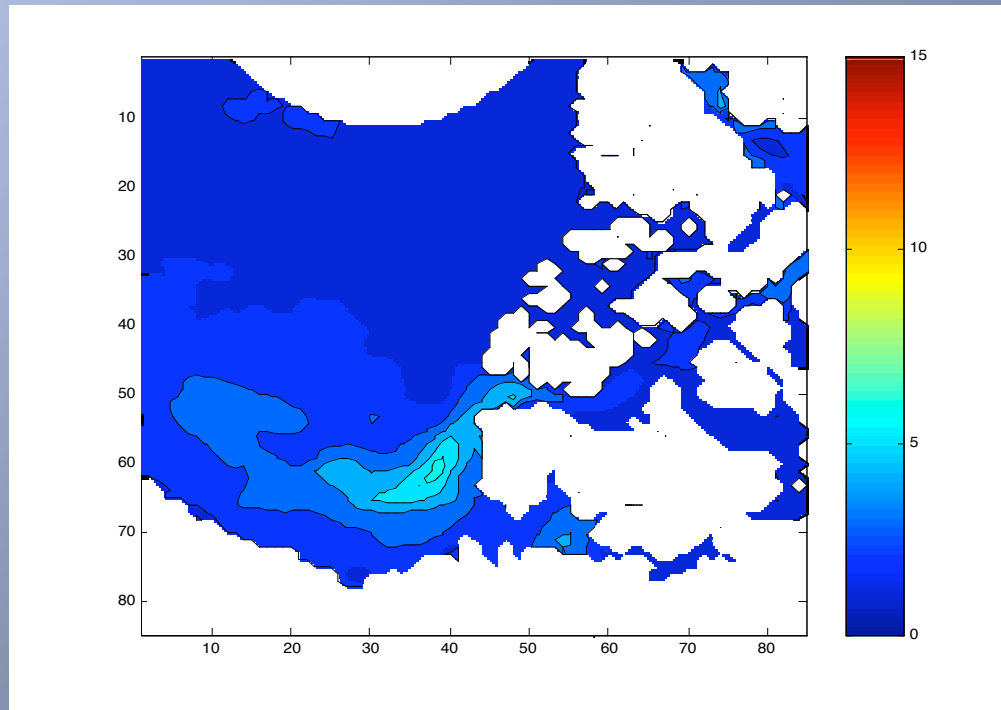

$$\langle (\phi(t) - \langle \phi \rangle)^2 \rangle$$

e-folding times ($R(\tau)=1/e$)

- Autocorrelation functions vary as a function of ice dynamics and thermodynamics
- e-folding times provide a statistical measure of persistence
- e-folding time spatial distribution (efsd) shows pattern?

Temporal autocorrelation functions and e-folding times

- Distinct coherent pattern exists
- Occurs in all years with stronger patterns in some than others
- Avg over 22 years presented

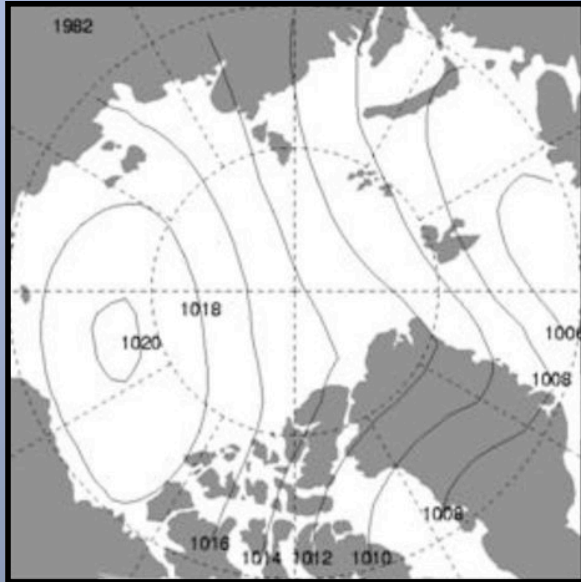

$$R(\tau) = \frac{\langle (\phi(\tau) - \langle \phi \rangle)(\phi(t + \tau) - \langle \phi \rangle) \rangle}{(\phi(t) - \langle \phi \rangle)^2}$$

$$(\phi(t) - \langle \phi \rangle)^2$$

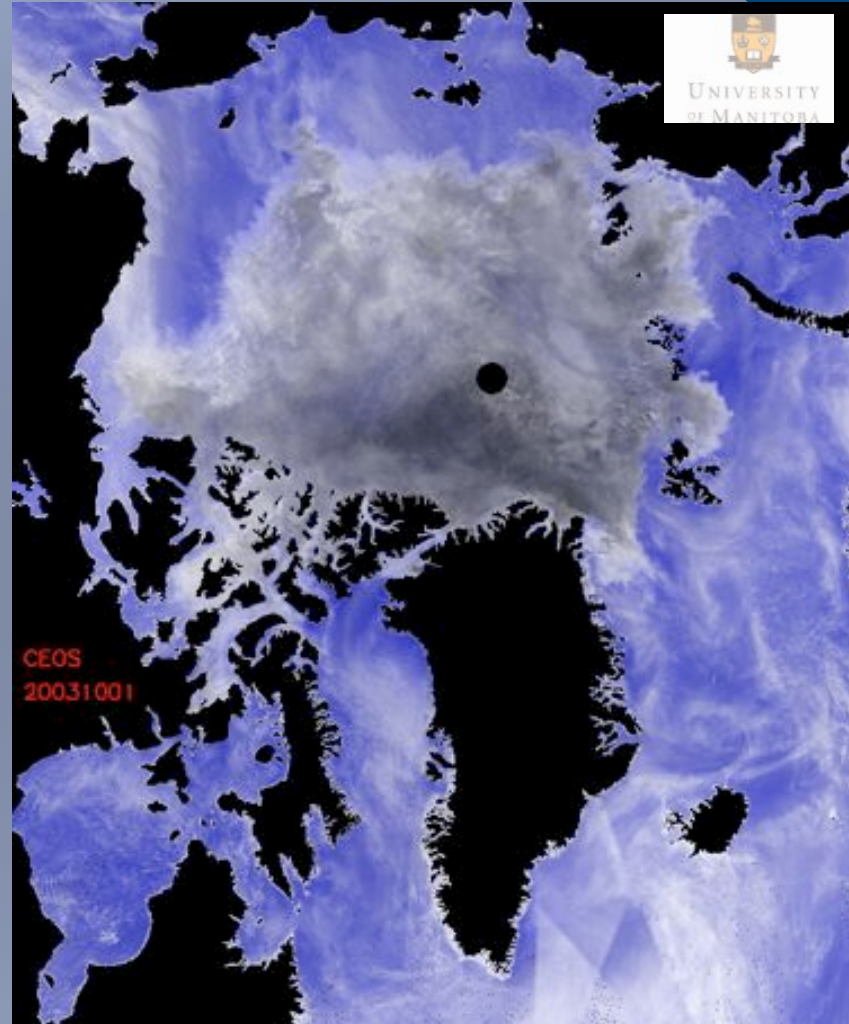

e-folding times ($R(\tau)=1/e$)

The Beaufort Gyre and Transpolar Drift (dynamic)

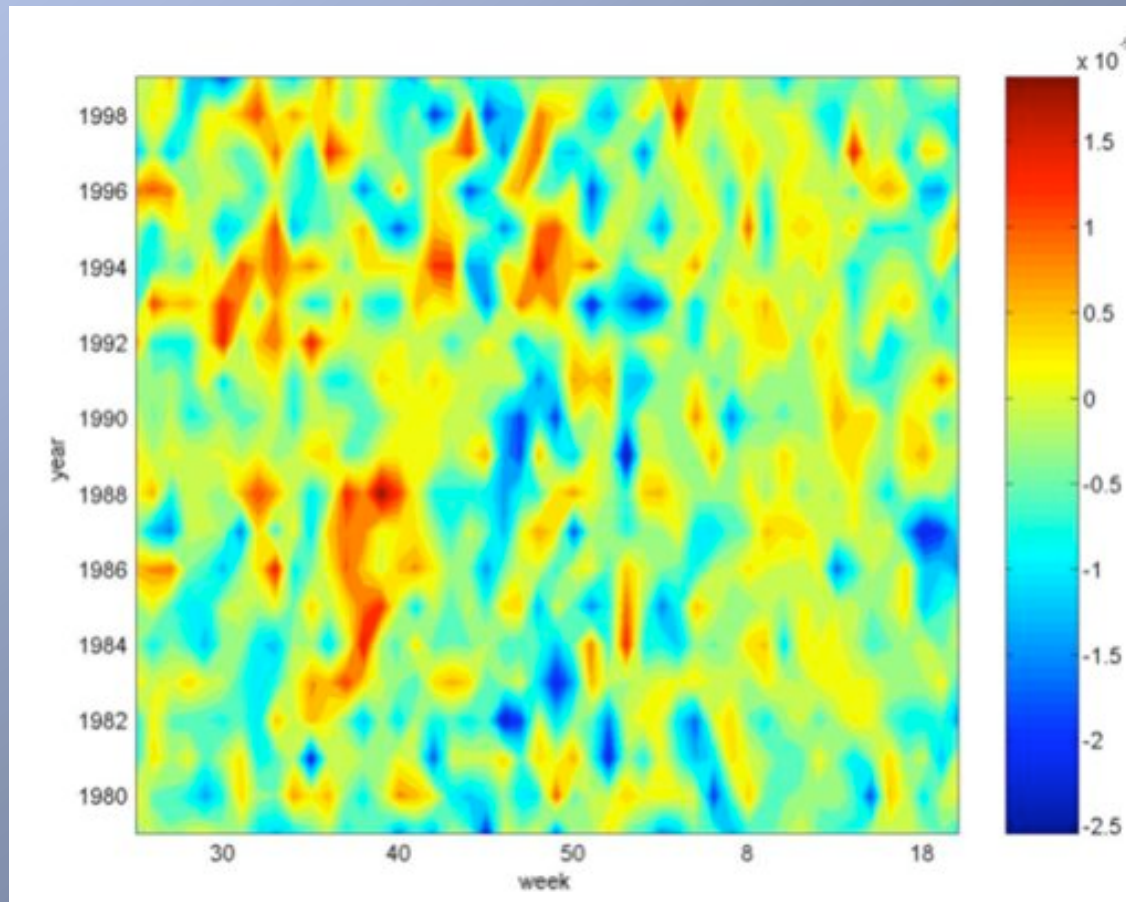

Average SLP

CEOS

The Beaufort Gyre and Transpolar Drift (dynamic)

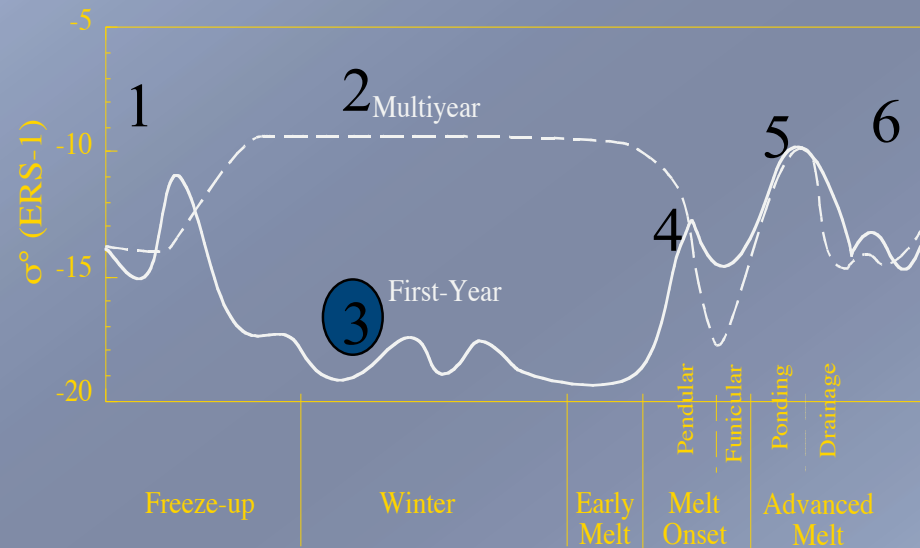

Mean relative vorticity
-Red (Blue) shades
denote **cyclonic**
(**anticyclonic**) activity

Reversal of the Beaufort Gyre

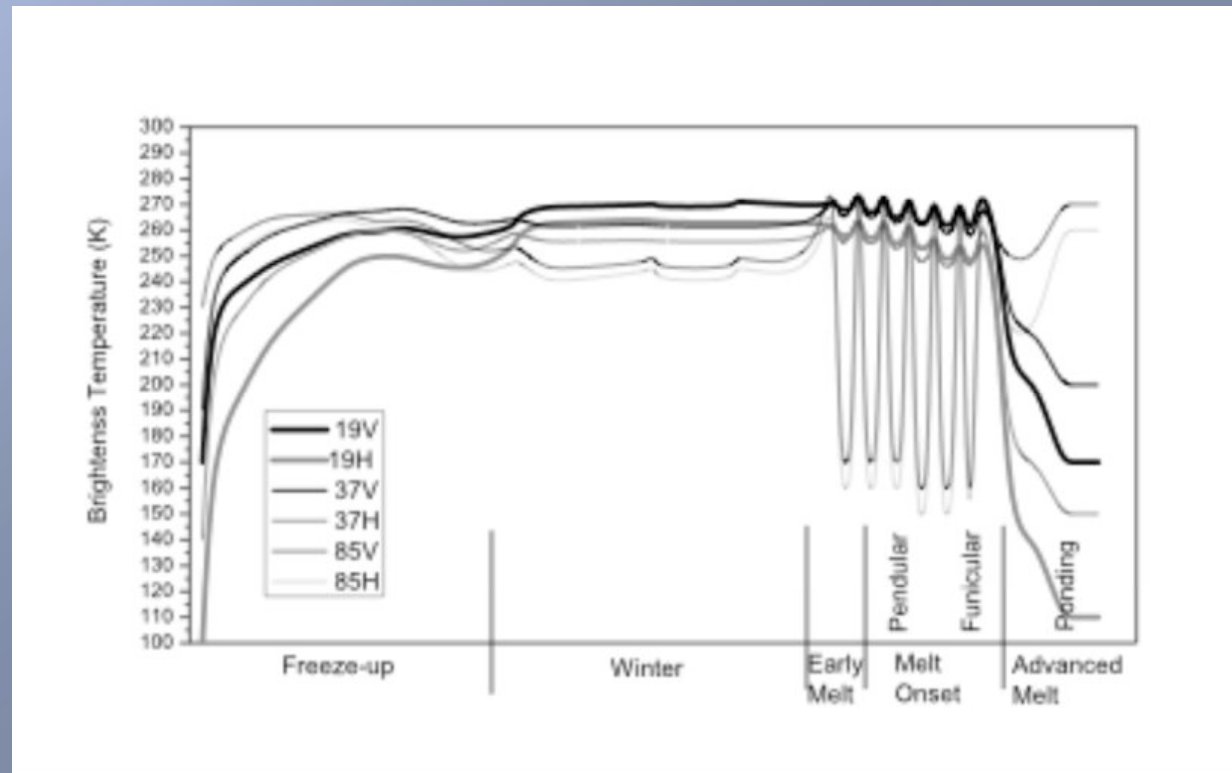

Temporal Evolution in σ°

Phenomenological summary of the seasonal evolution of σ° for thick first year and multi-year sea ice from ERS data.

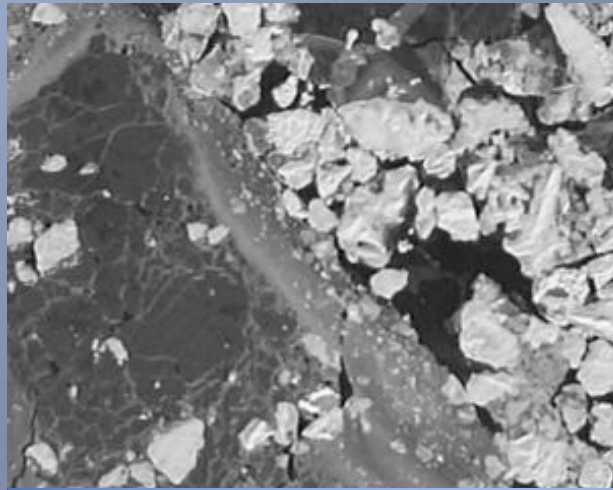

The Temporal Evolution of T_b

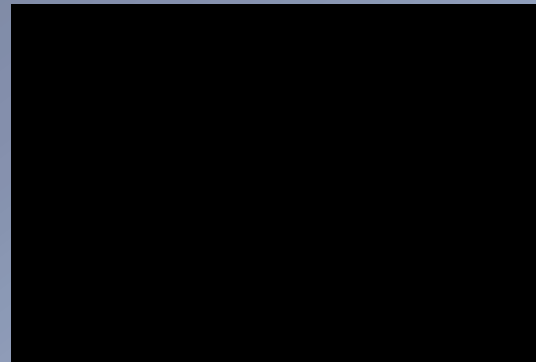

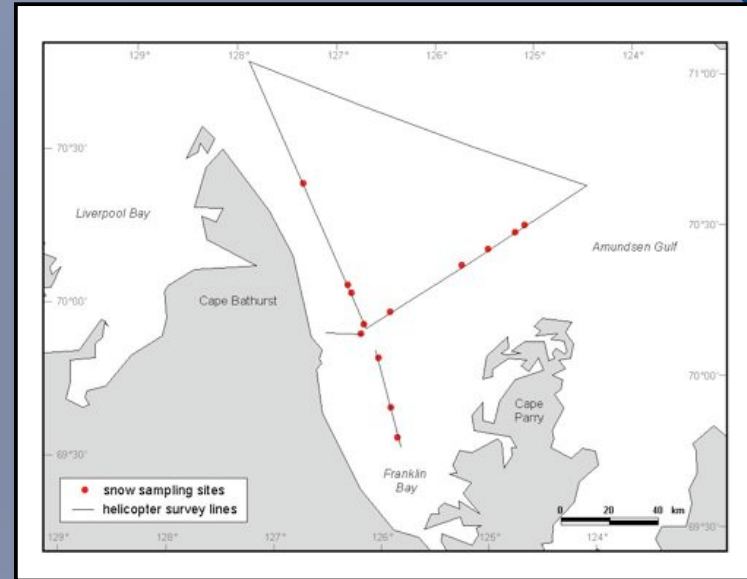

Evaluation of SAR sea ice concentration, type, thermodynamic State

- MYI
- FYI
- Rubble
- Pond fraction
- Time series
- (type)
- SWE

Linking snow distribution and ice roughness over first-year sea ice

- Objectives:
 - (i) characterizing and statistically modeling the relationship between ice roughness and snow distribution and
 - (ii) using this relationship to recreate the snow distribution using a snow distribution model and ice roughness information.
- Methods: helicopter EM (Ice Pic) and in situ snow sampling

Radiative Transfer Studies

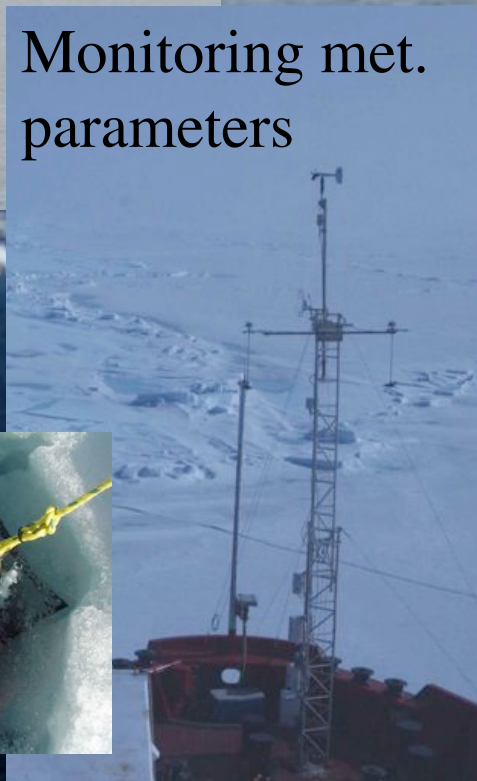

Optical measurements

Ice sampling

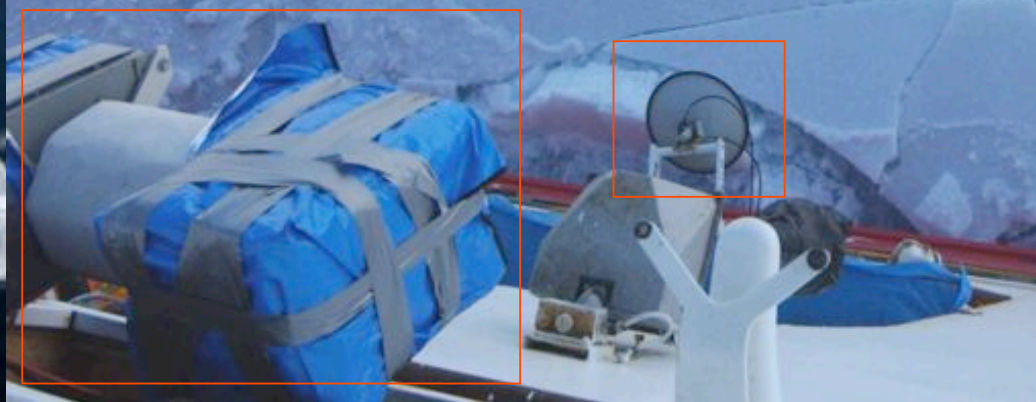

Monitoring met.
parameters

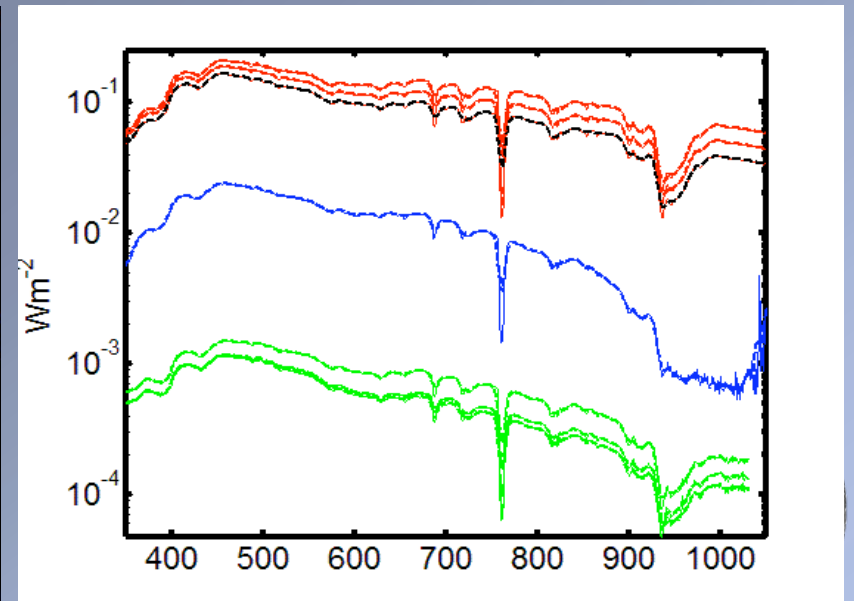

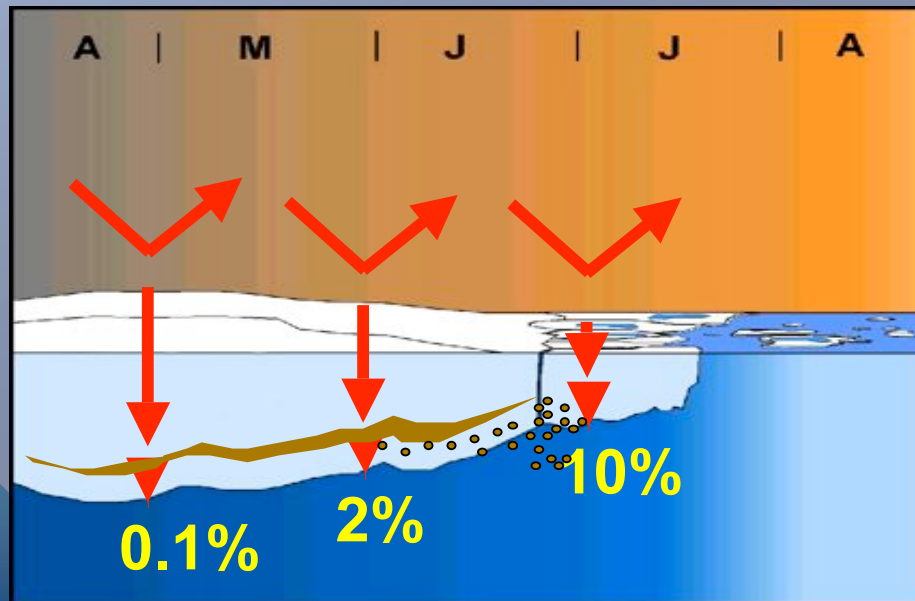

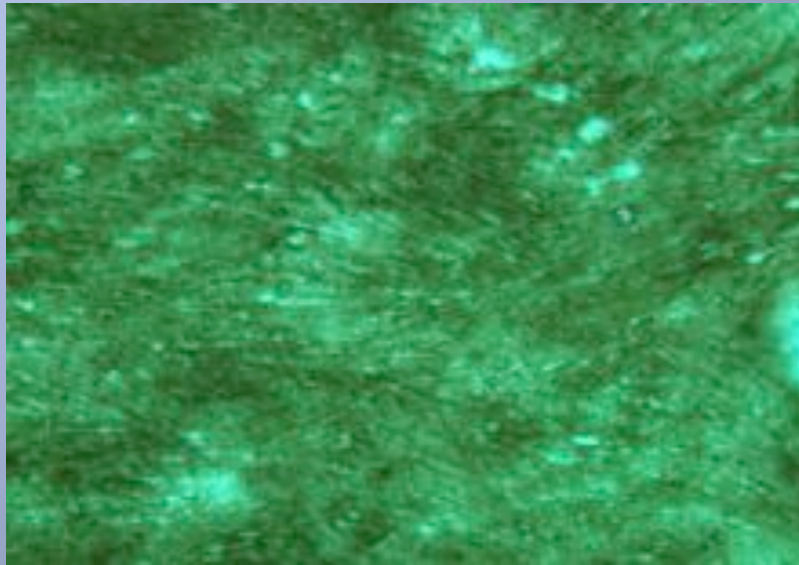

CTD casts

Passive and active
microwave measurements

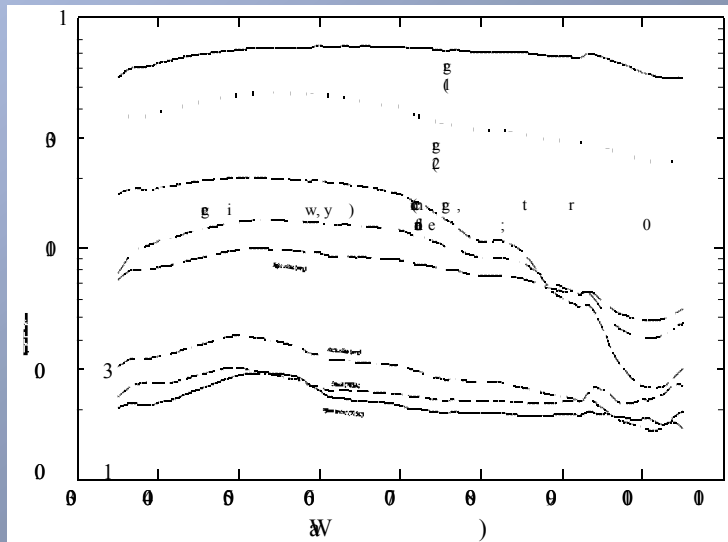

Ehn et al. 2006

CEOS

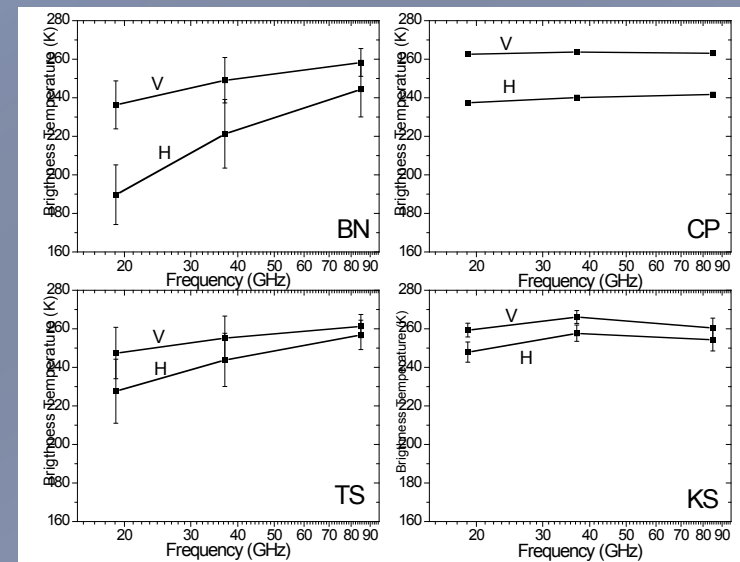

Spectral reflectance and brightness temperature (*In situ* measurements)

Spectral reflectance

*Ice and snow thickness is shown in the parenthesis with station name. The 'avg' refer to an average albedo of all observed spectra of the specific ice type

Spectral brightness temperature

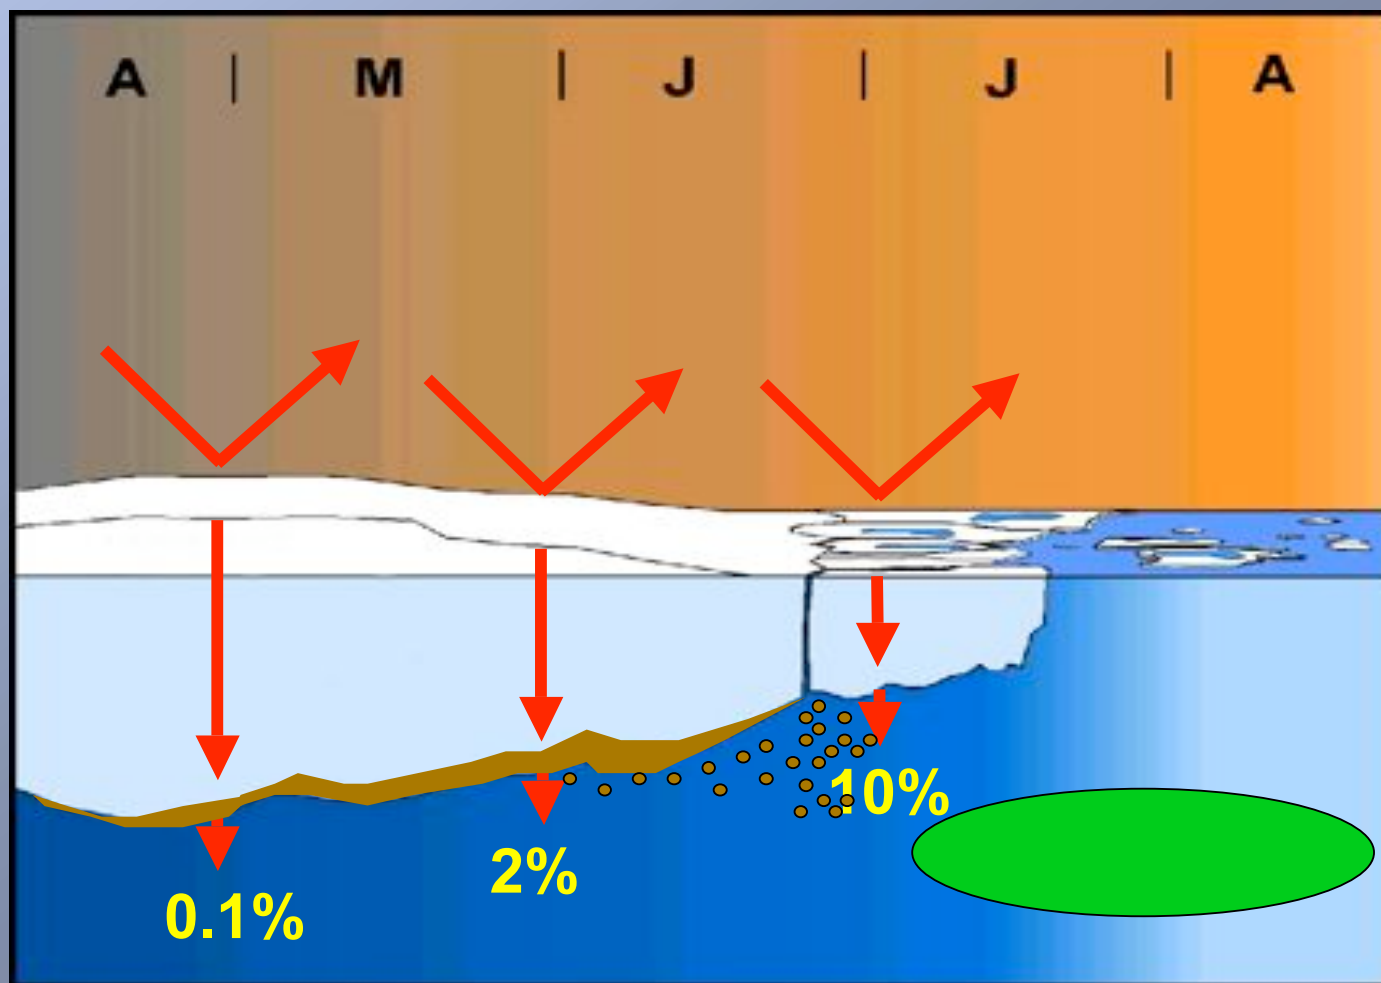

*BN, CP, TS and KS denotes bare ice, consolidated pancake ice, thin snow-covered, and thick snow-covered ice, respectively. 'V' are for vertical and 'H' for horizontal polarization.

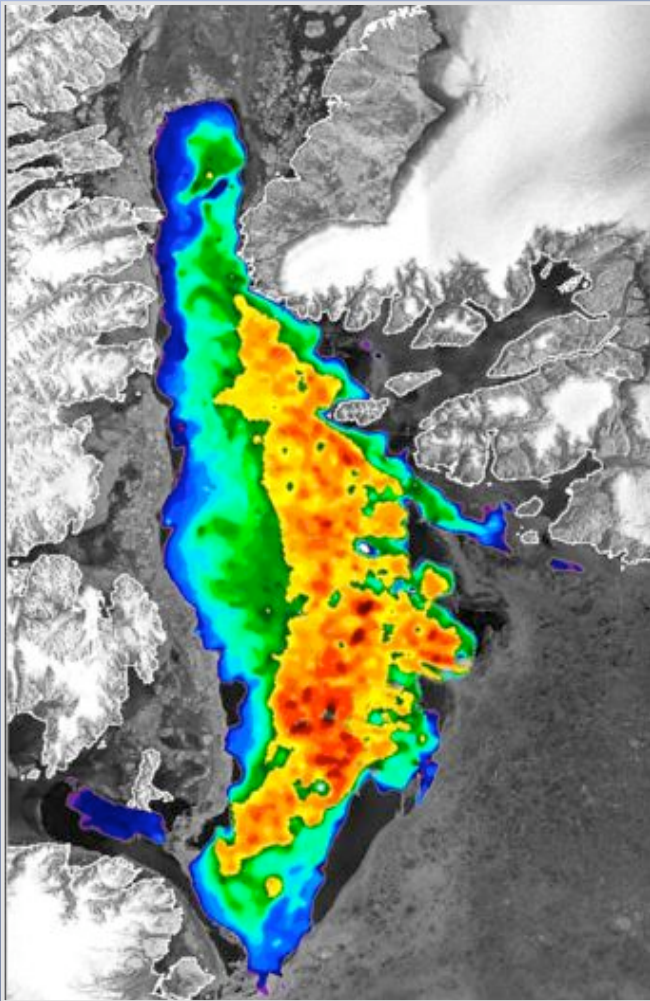

Ehn et al. 2006
Hwang et al. 2006

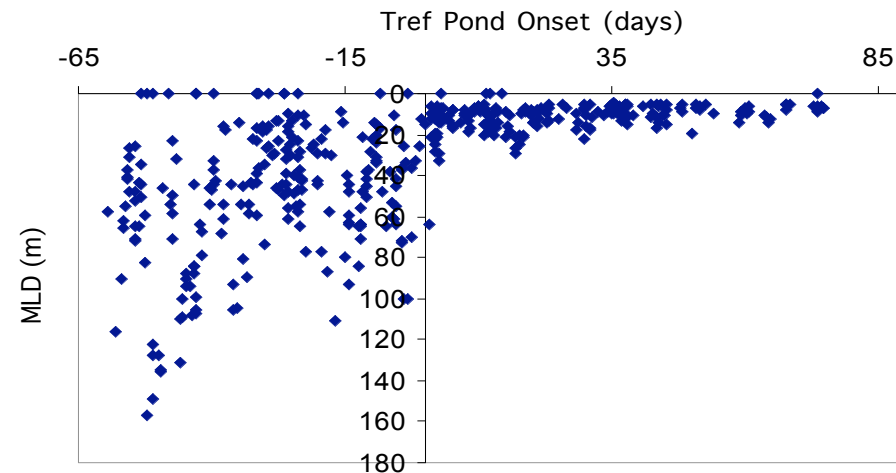

PAR transmission

Phytoplankton and sea ice

Radarsat derived pond onset
CTD computed mixed layer depths

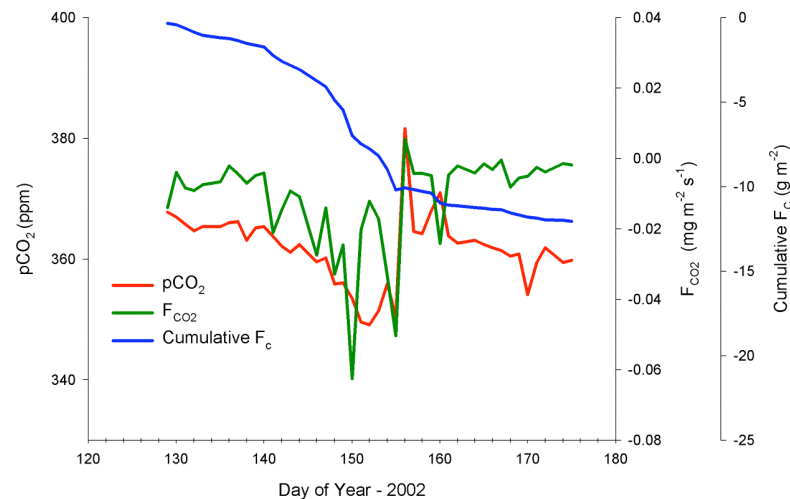

Ocean Colour

SeaWifs

Galley and Barber, 2004

Gas permeability

- Evidence of strong air-surface exchange of CO_2 .
- Flux is associated with brine chemistry thus link to dielectrics
- How is the carbon used in the cryosphere/biosphere?
- Flux is about the same magnitude as a wetland!

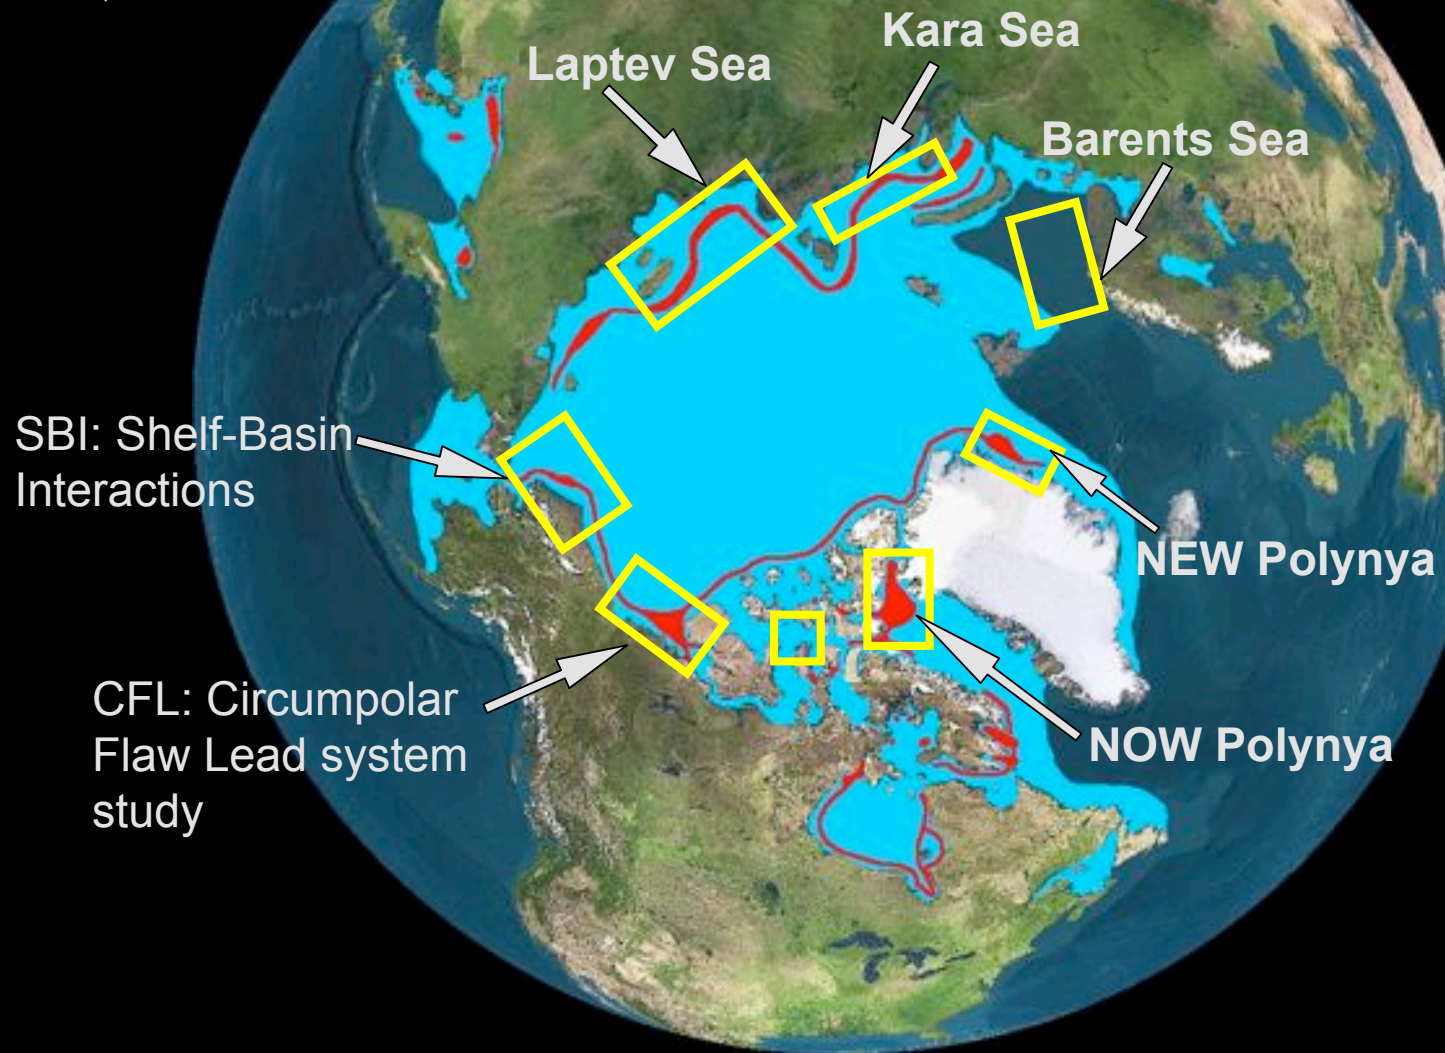

Papakyriakou, 2004

The International Polar Year

30 graduate students
10 postdocs
40M\$

Conclusions

- First and strongest impacts of global scale climate change are being felt now in the Arctic.
- Remote Sensing is a key observation technique when combined with in situ and modelling approaches
- Measurement vs Modelling

Next Lecture

- 1) Arctic Climate Change and Remote Sensing
- 2) Geophysics, dielectrics and thermodynamics
- 3) Scattering and emission modeling
