Ocean colour sensors are designed to study the marine ecosystem

What are the key properties of the marine ecosystem that are vulnerable to climate change and can be detected using satellite data?

Can we design a time series fit for purpose?

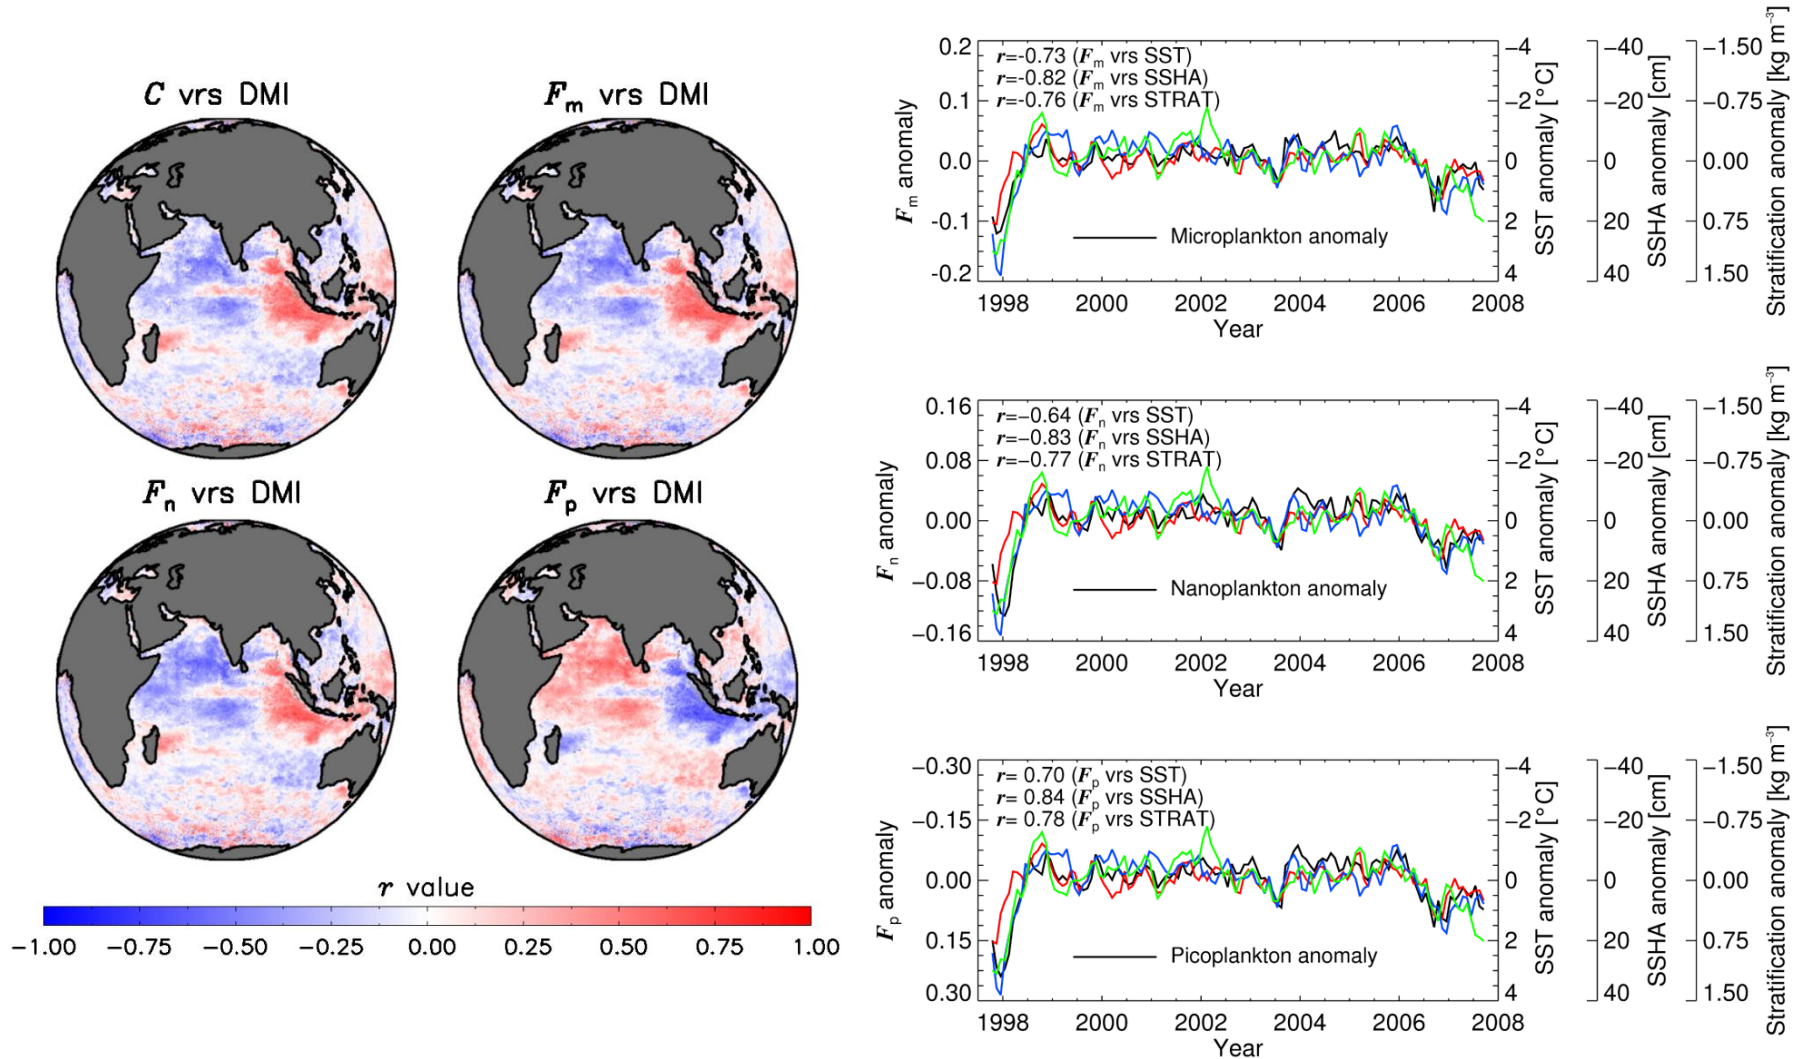

Results from the Ocean-Colour Climate Change Initiative of the European Space Agency

Multi-decadal changes in chlorophyll concentration related to changes in SST

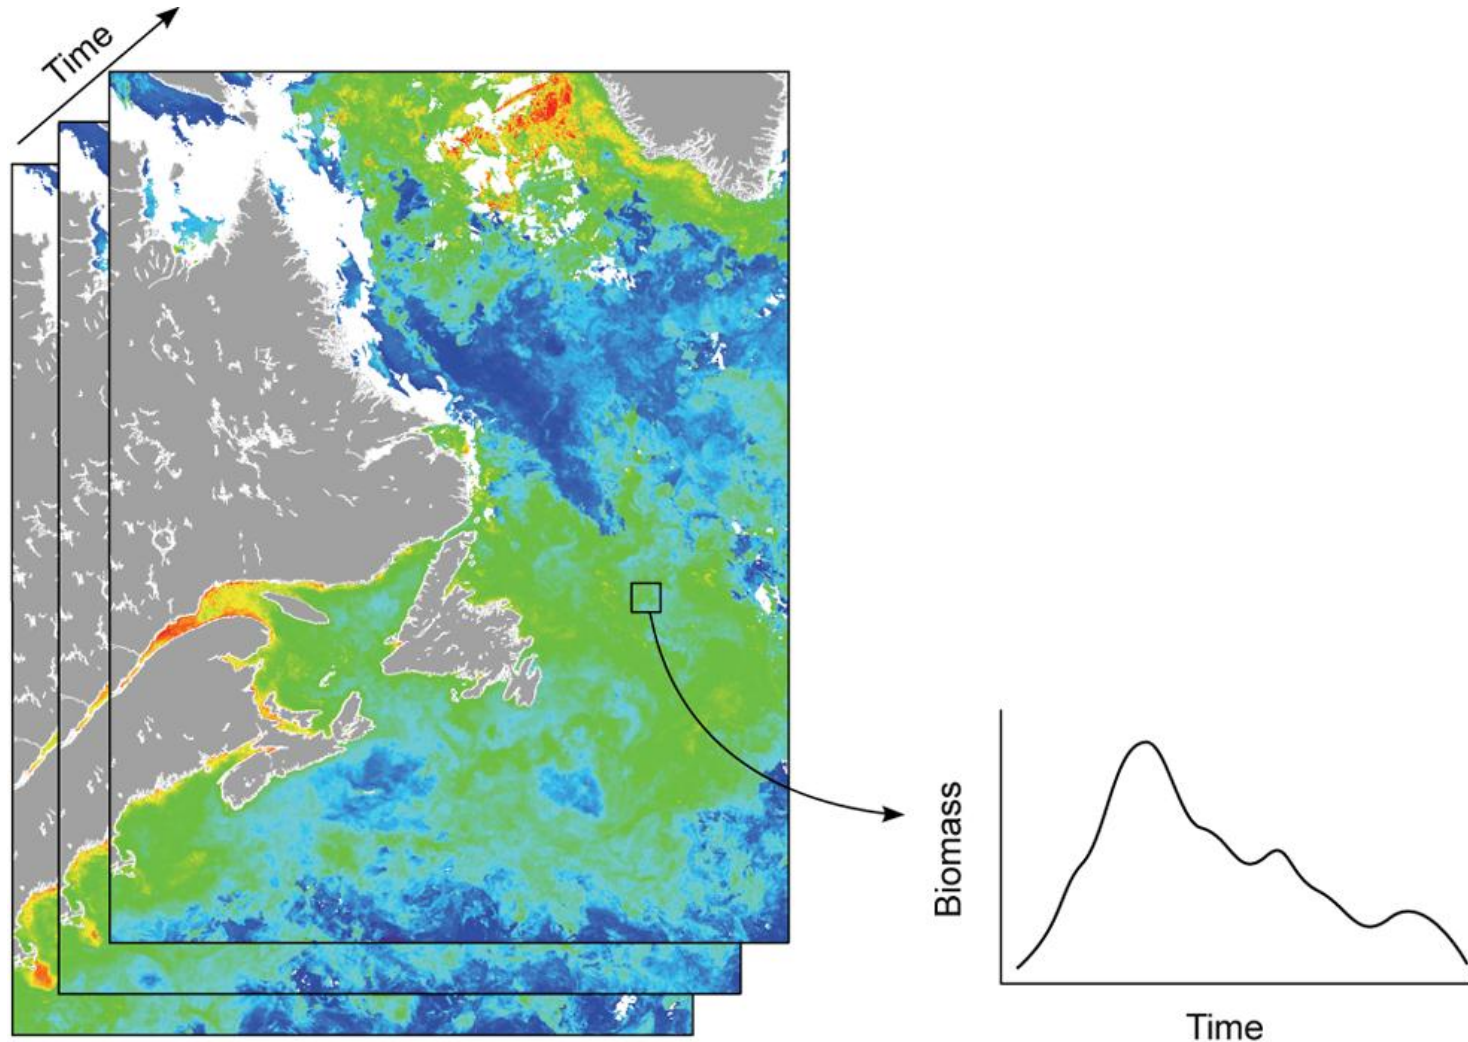

Martinez et al. (2009)

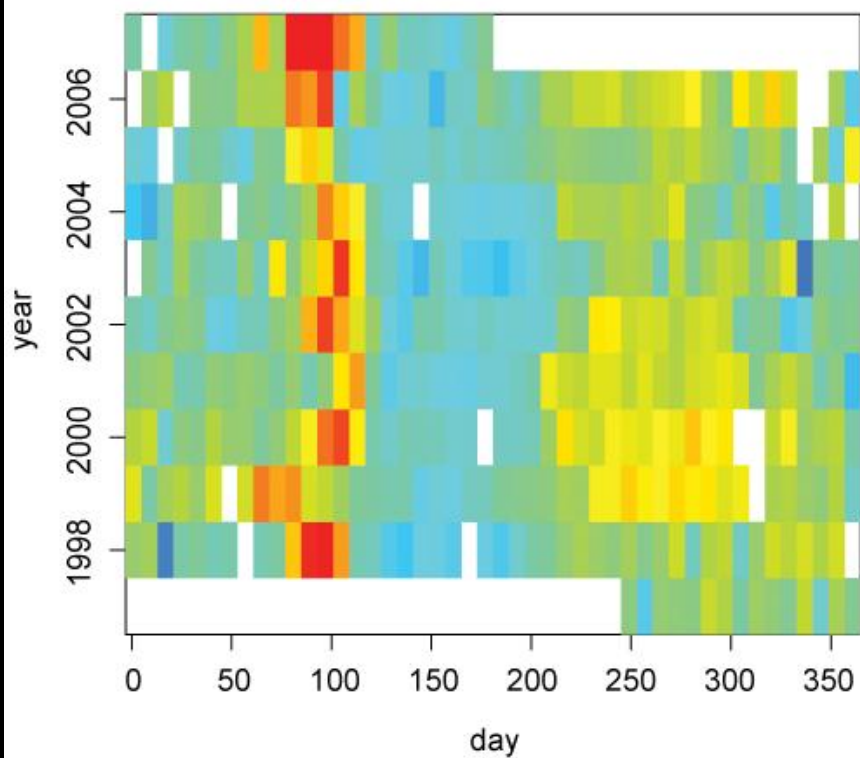

Diagnose changes in phytoplankton size structure using EO

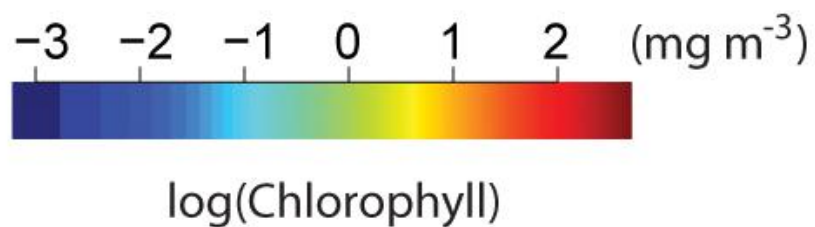

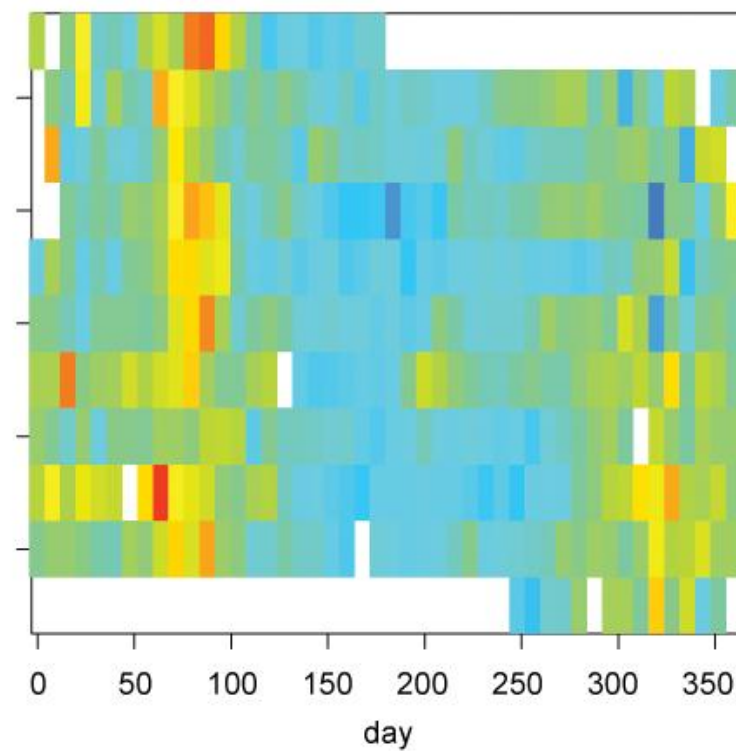

Construction of time series possible at any chosen scale of spatial averaging

Potential Responses of the Marine Ecosystem to a Changing Climate

We see that, in a changing climate,

- Total amount of phytoplankton (as indexed by chlorophyll-a concentration) might change
- The community structure associated with the chlorophyll concentration might change
- Other substances that absorb and scatter light in the visible domain might change, relative to chlorophyll-a
- The phenology might change (e.g. timing, amplitude and duration of blooms)

These considerations guided the algorithm selection process in the Ocean Colour Climate Change Initiative.

GCOS Ocean Colour requirements: a major challenge

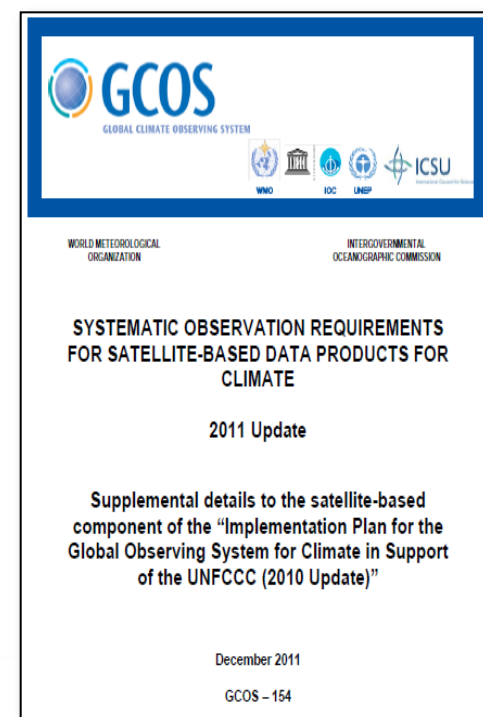

Goal: create the most complete and consistent possible error-characterized time series of multi-sensor global satellite ECV products for climate research and modeling meeting GCOS requirements

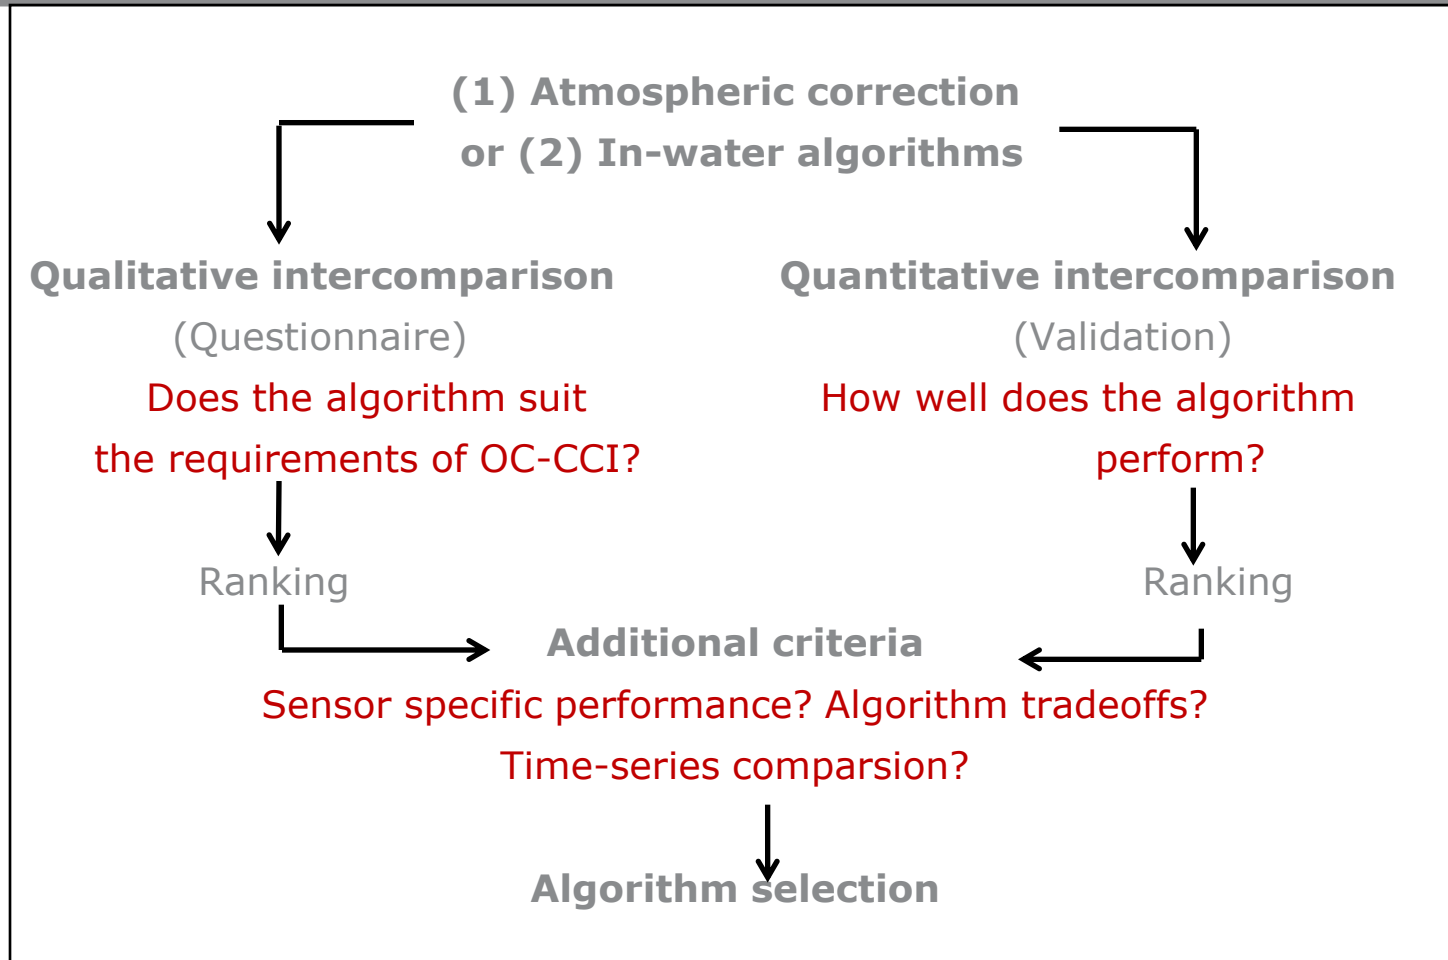

GCOS-154 updated December 2011

Variable/ Parameter	Horizontal Resolution	Vertical Resolution	Temporal Resolution	Accuracy	Stability
Water Leaving Radiance	4km	N/A	daily	5%	0.5%
Chlorophyll-a concentration	30km	N/A	weekly averages	30%	3%

Note: OC-CCI to create time series of inherent optical properties as well.

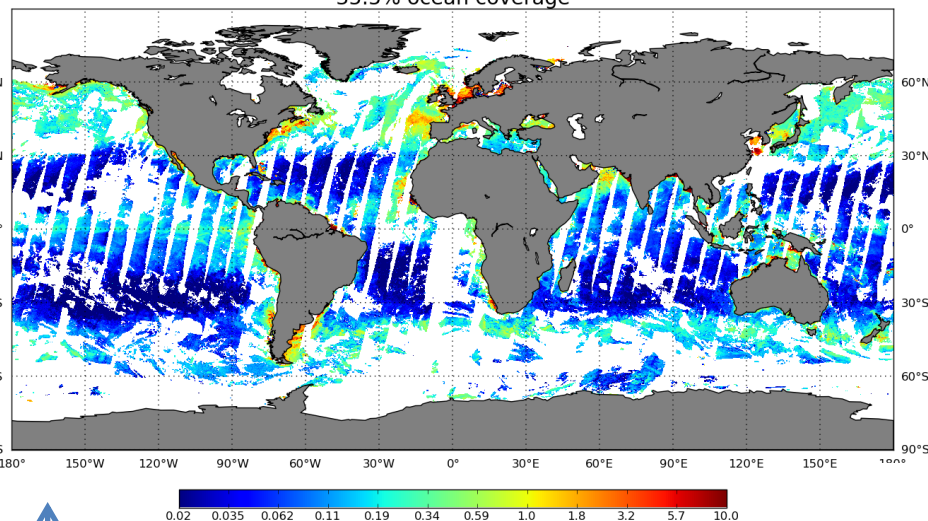

Intercomparison Criteria

Atmospheric correction algorithm

MERIS L2 RR composite 3-days (20030320 to 20030322)
35.5% ocean coverage

Chlorophyll concentration (mg m^{-3})

MEGS ocean coverage: 35.5%
POLYMER ocean coverage: 73%

Example: Three-day composite
Chlorophyll concentration
(20-03-2003 to 22-03-2003)

Note: Verification on-going. For example,
are all high-latitude values reliable?

POLYMER:

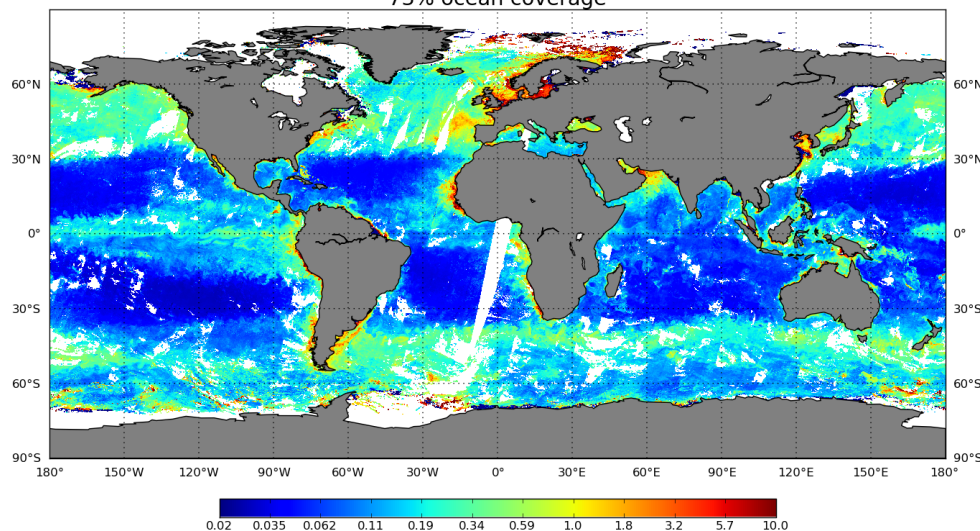

Selected Atmospheric Correction Algorithm for MERIS

One of the advantages: Improved spatial
coverage (User Requirement)

Note: MyOcean will be using OC-CCI
products as standard products

Directly applicable to Sentinel-3 OLCI

MERIS POLYMER composite 3-days (20030320 to 20030322)
73% ocean coverage

Chlorophyll concentration (mg m^{-3})

OC-CCI Data Merging: Approach

$$R_{RS}^A(\lambda_{i,A}) - R_{RS}^M(\lambda_{i,M}) - R_{RS}^S(\lambda_{i,S}) \quad [\text{input } R_{RS} \text{ from each sensor}]$$

Band shift

IOP model

$$R_{RS}^A(\lambda_i) - R_{RS}^M(\lambda_i) - R_{RS}^S(\lambda_i) \quad [R_{RS} \text{ on a common band set}]$$

Bias Correction +
Merging

error
estimates

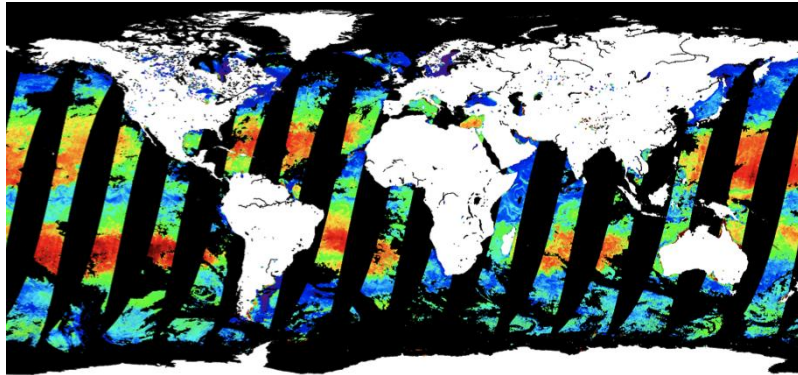

IOP model

MERIS Radiance

MODIS-A Radiance

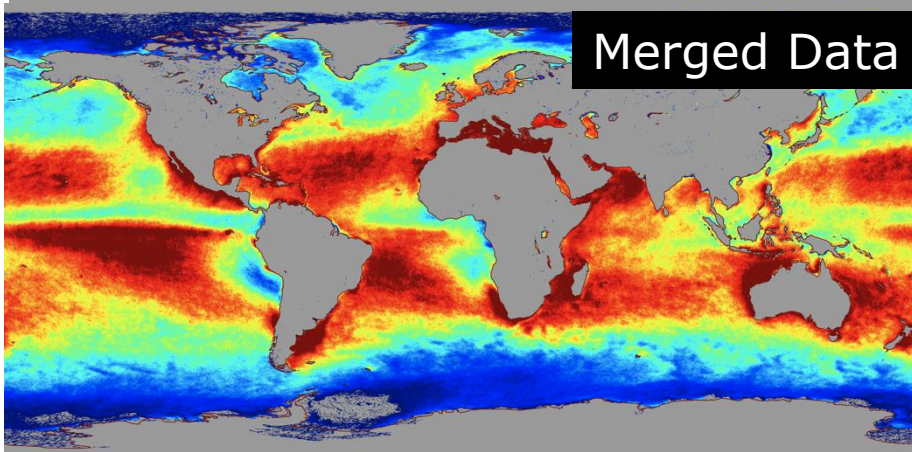

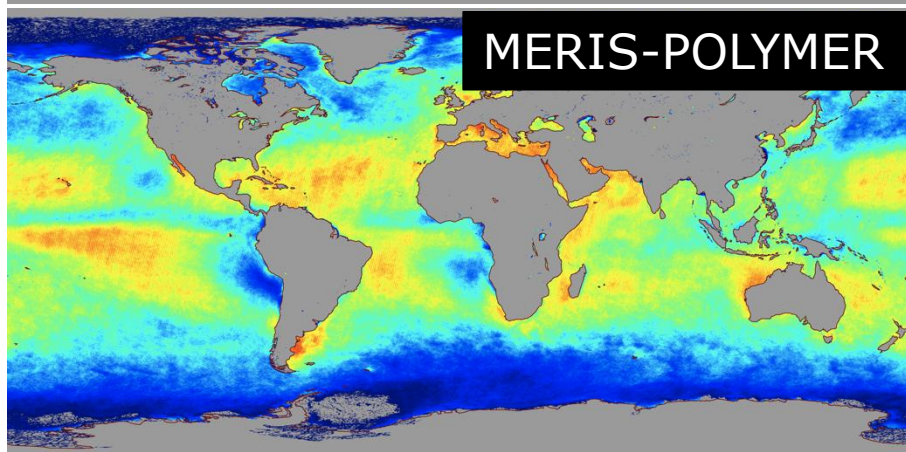

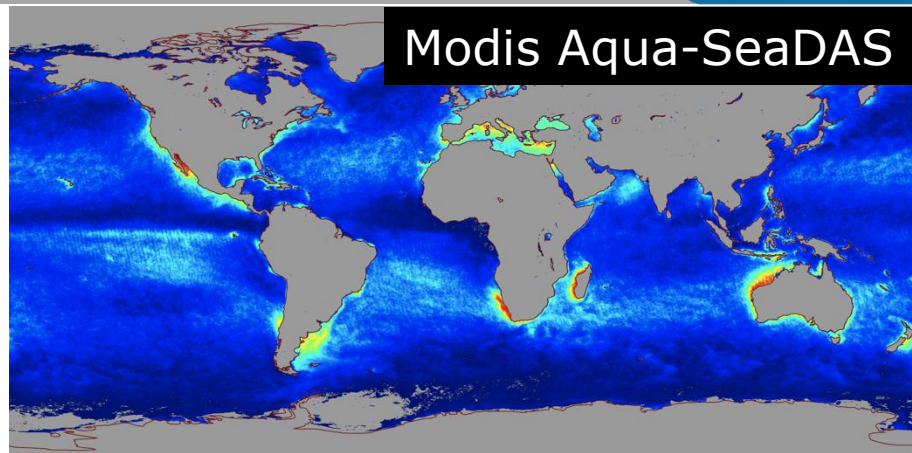

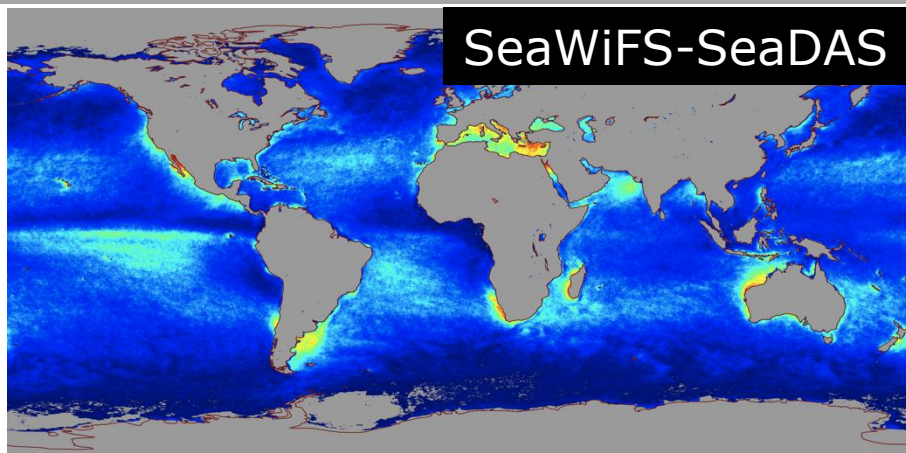

Band-shifting, bias correction,
Merged product

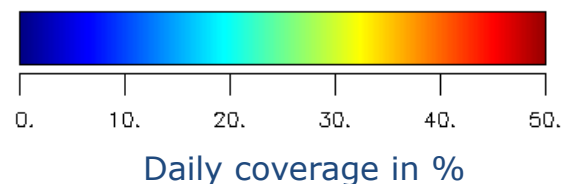

Rrs 443

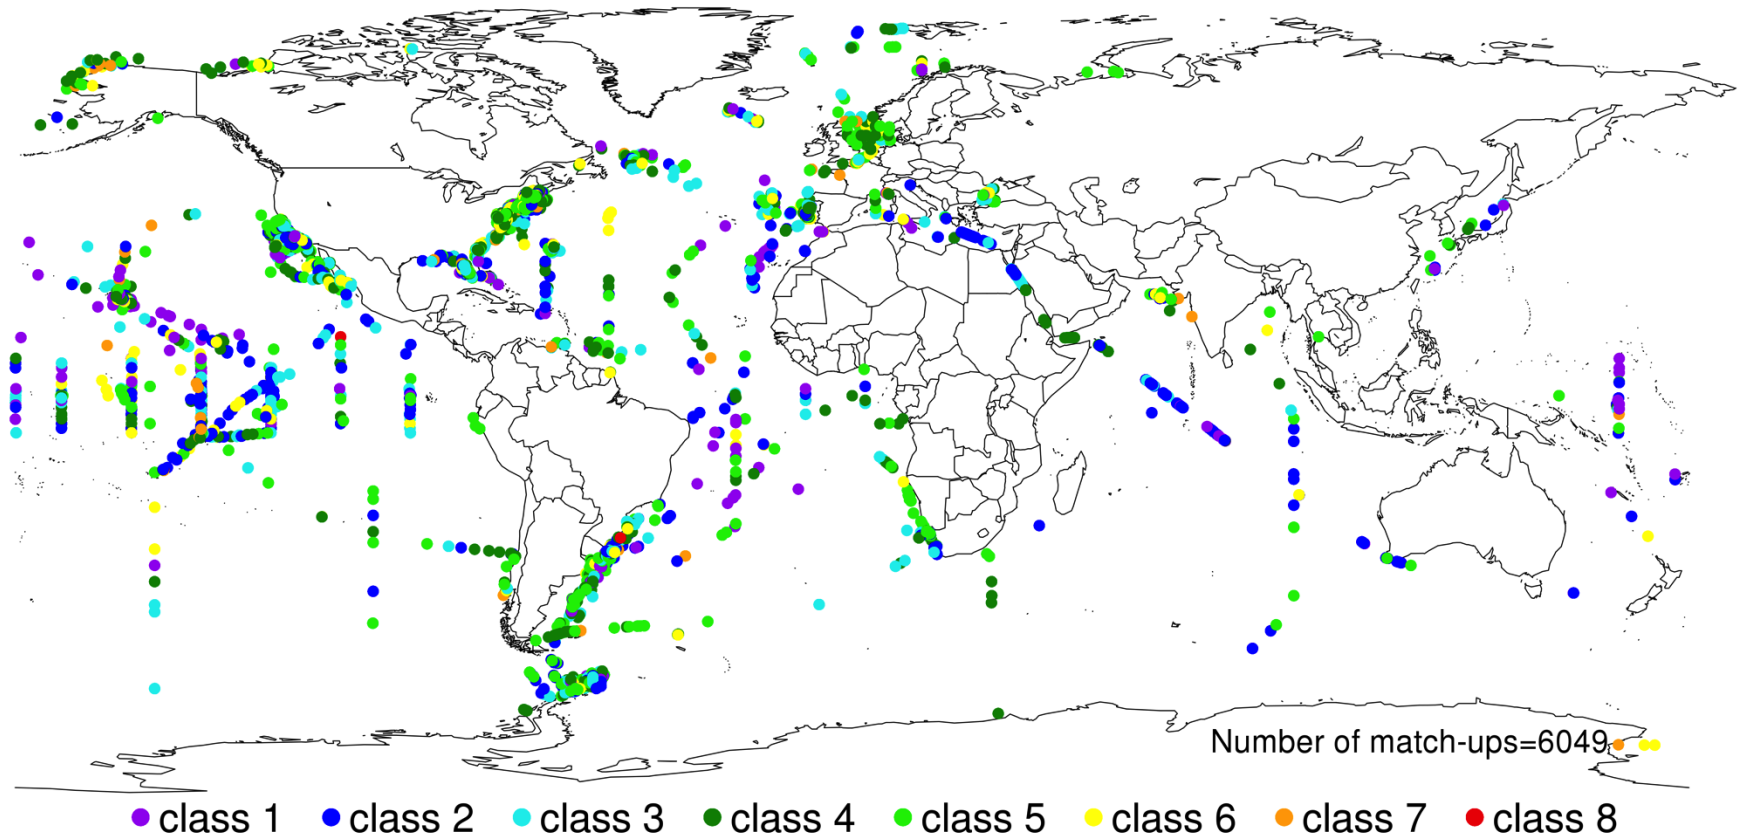

Geographic distribution of frequency of coverage of retrieved data

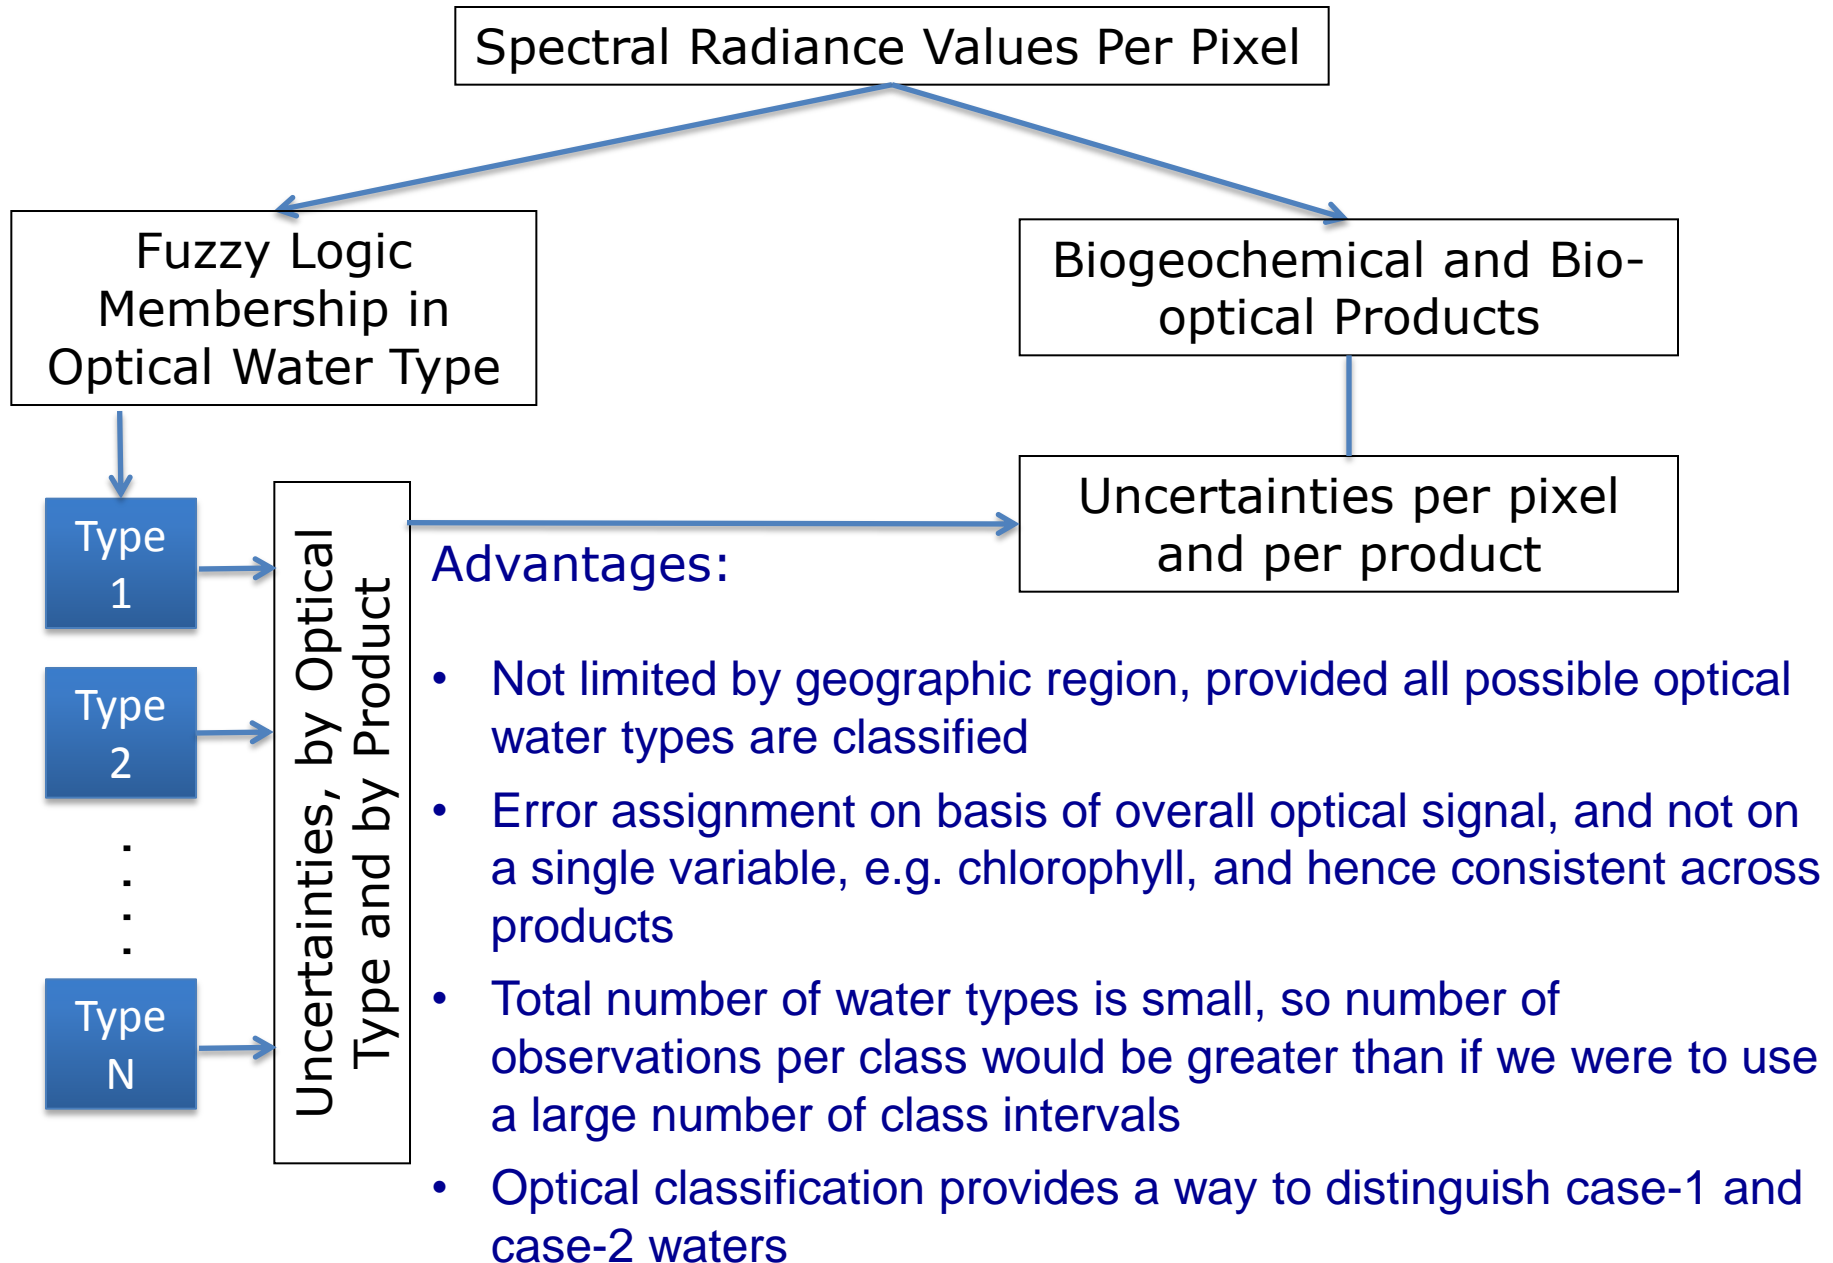

- Inter-sensor bias corrected prior to merging, to avoid spurious trends in merged data
- Band-shifted to produce consistency in data across sensors
- Enhanced contribution from MERIS due to POLYMER capability to deal with sun glint and thin clouds

OC-CCI chlorophyll match-up locations and water class types

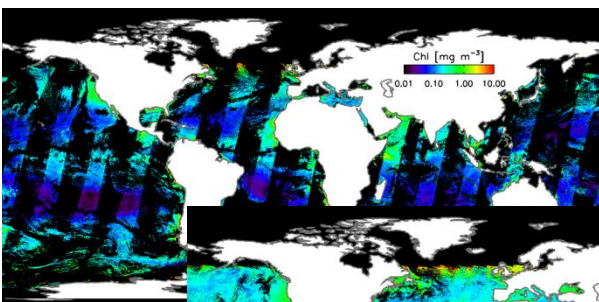

Error Specification according to Optical Water Type

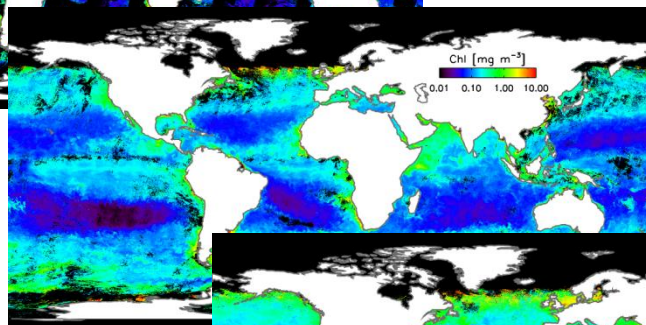

Daily

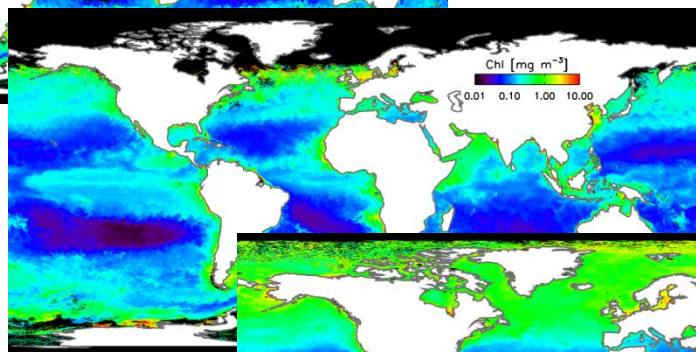

Weekly

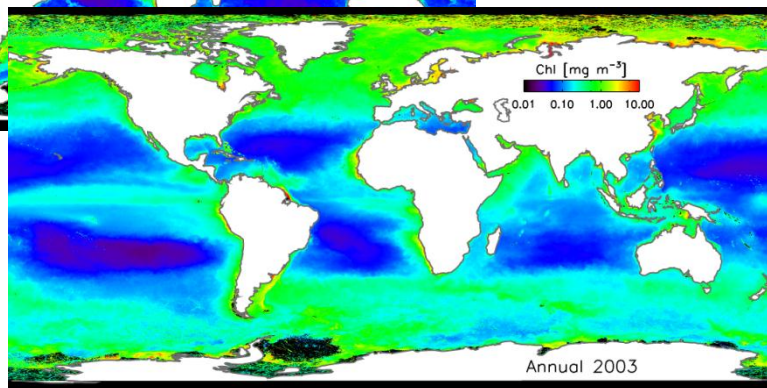

Improved spatial coverage, even at weekly scale

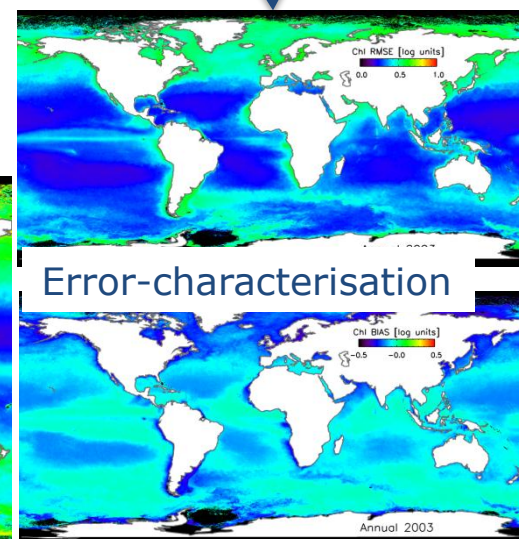

Monthly

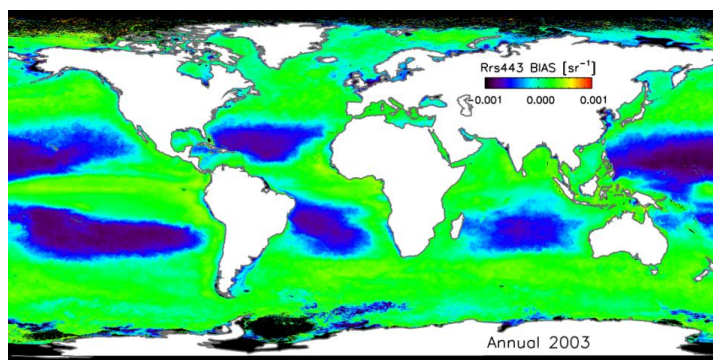

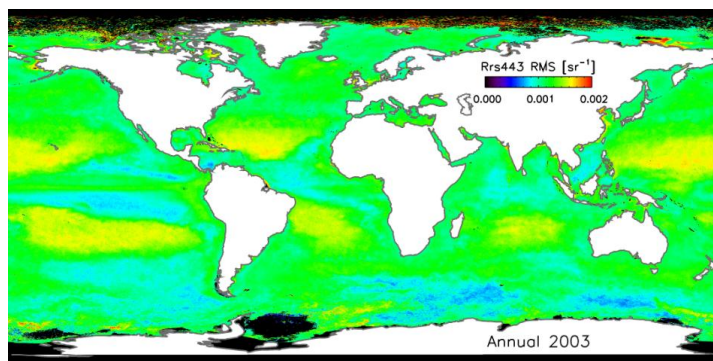

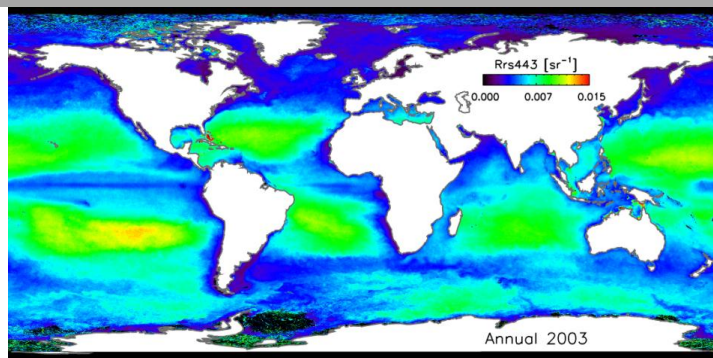

Annual

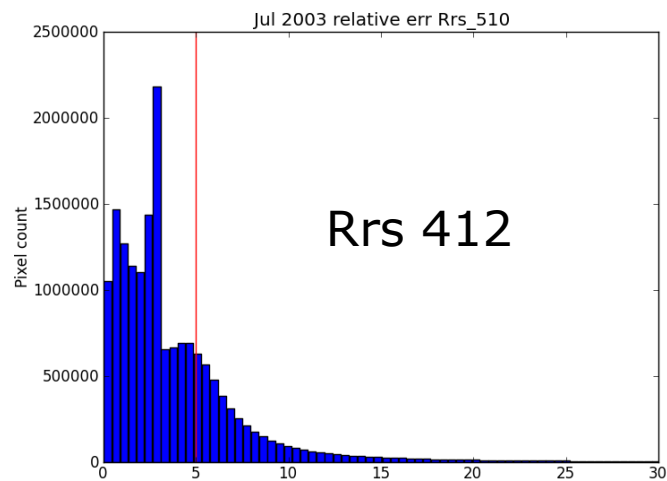

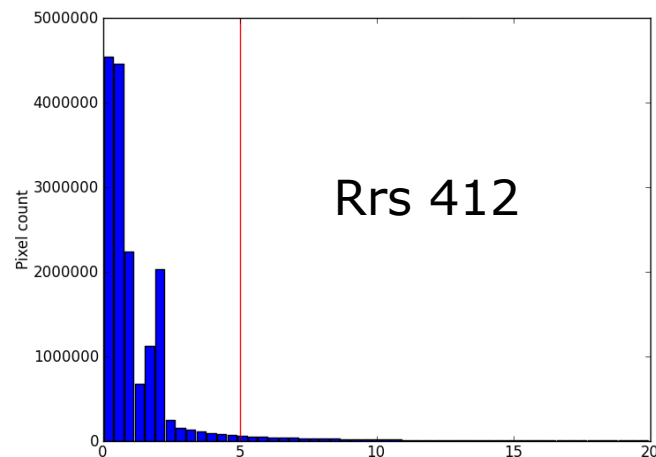

Error specification (RMSE and bias) based on comparison with match-up in situ data & extrapolation to global ocean

Ocean Colour: Uncertainties and GCOS Requirements

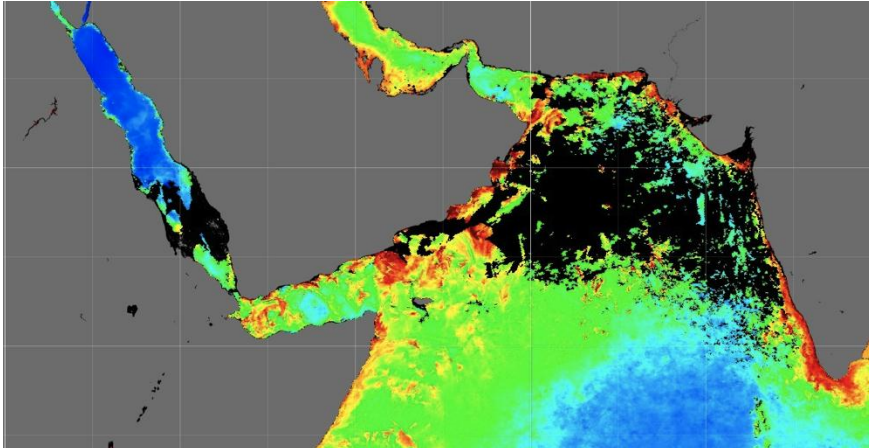

Relative Error

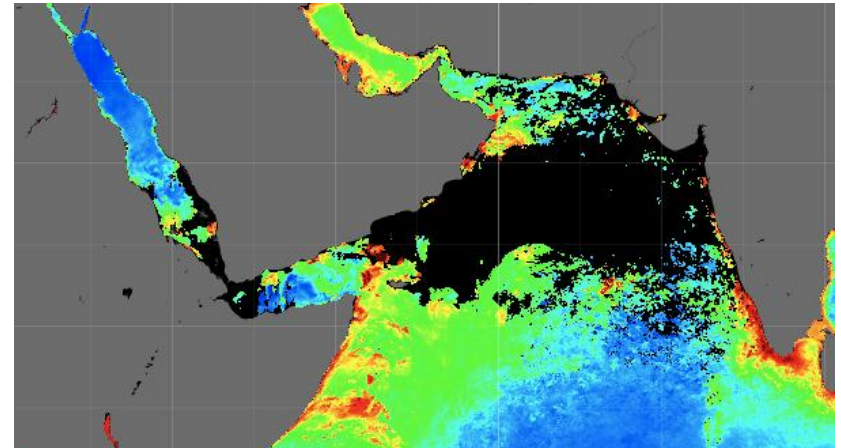

First of its kind, based on user feedback, according to a method that uses optical water classification (Moore et al. 2009).

Dual Role for Light Absorbed by Phytoplankton

Diffuse attenuation coefficient K and mixed-layer depth

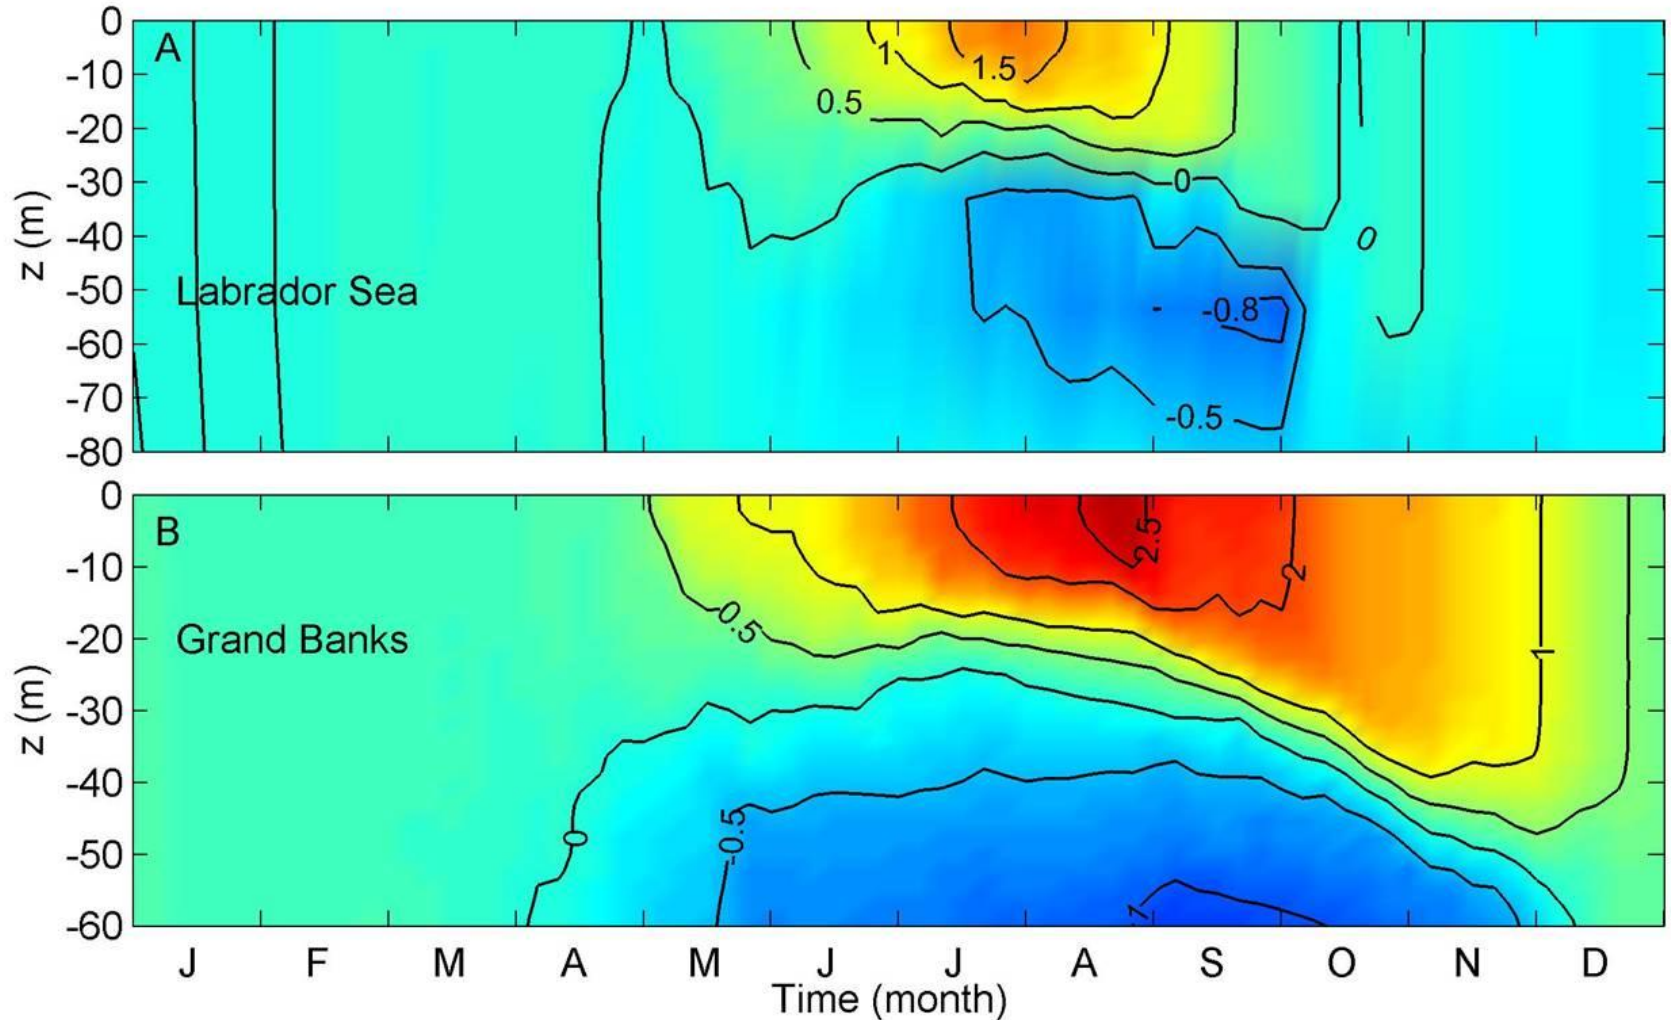

Deep photic layer
Favours deep mixed layer

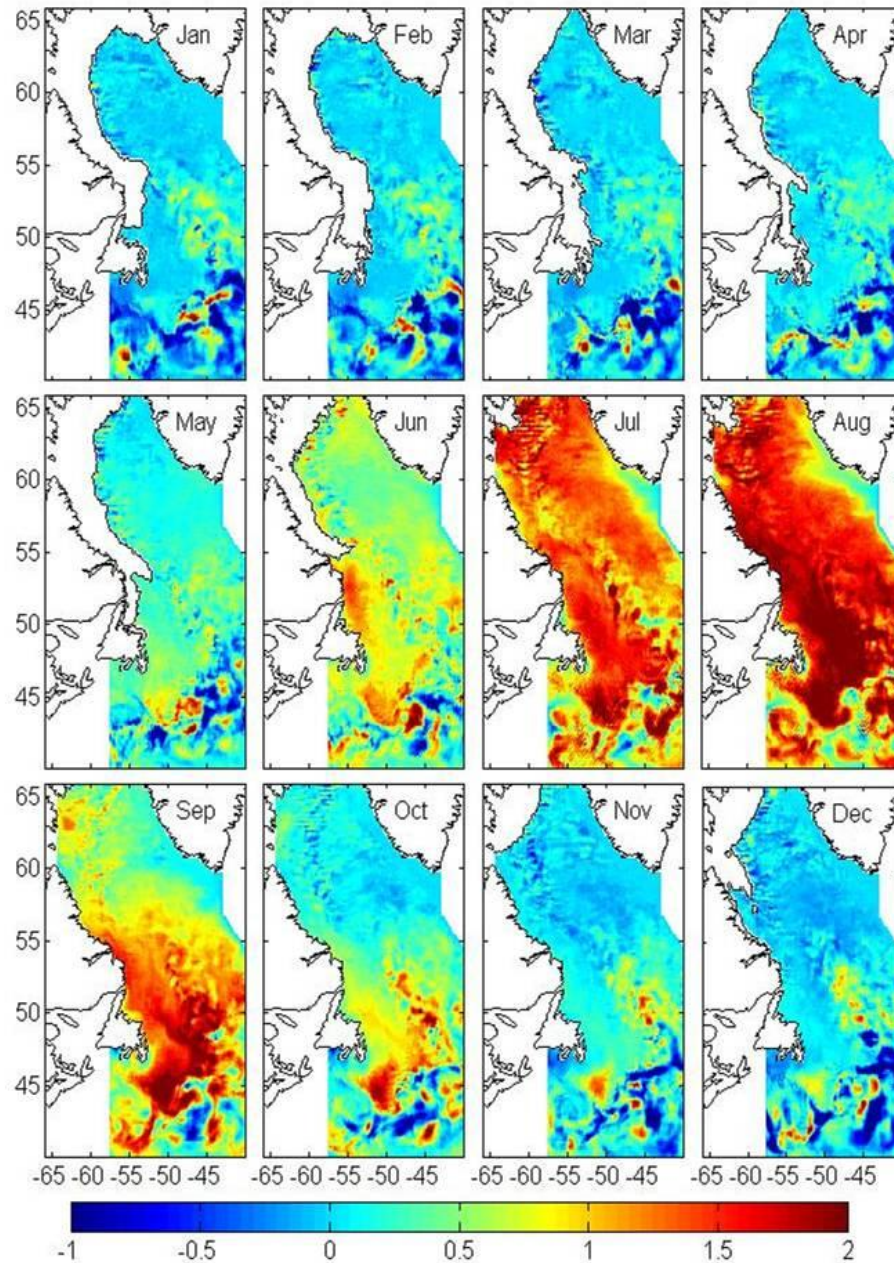

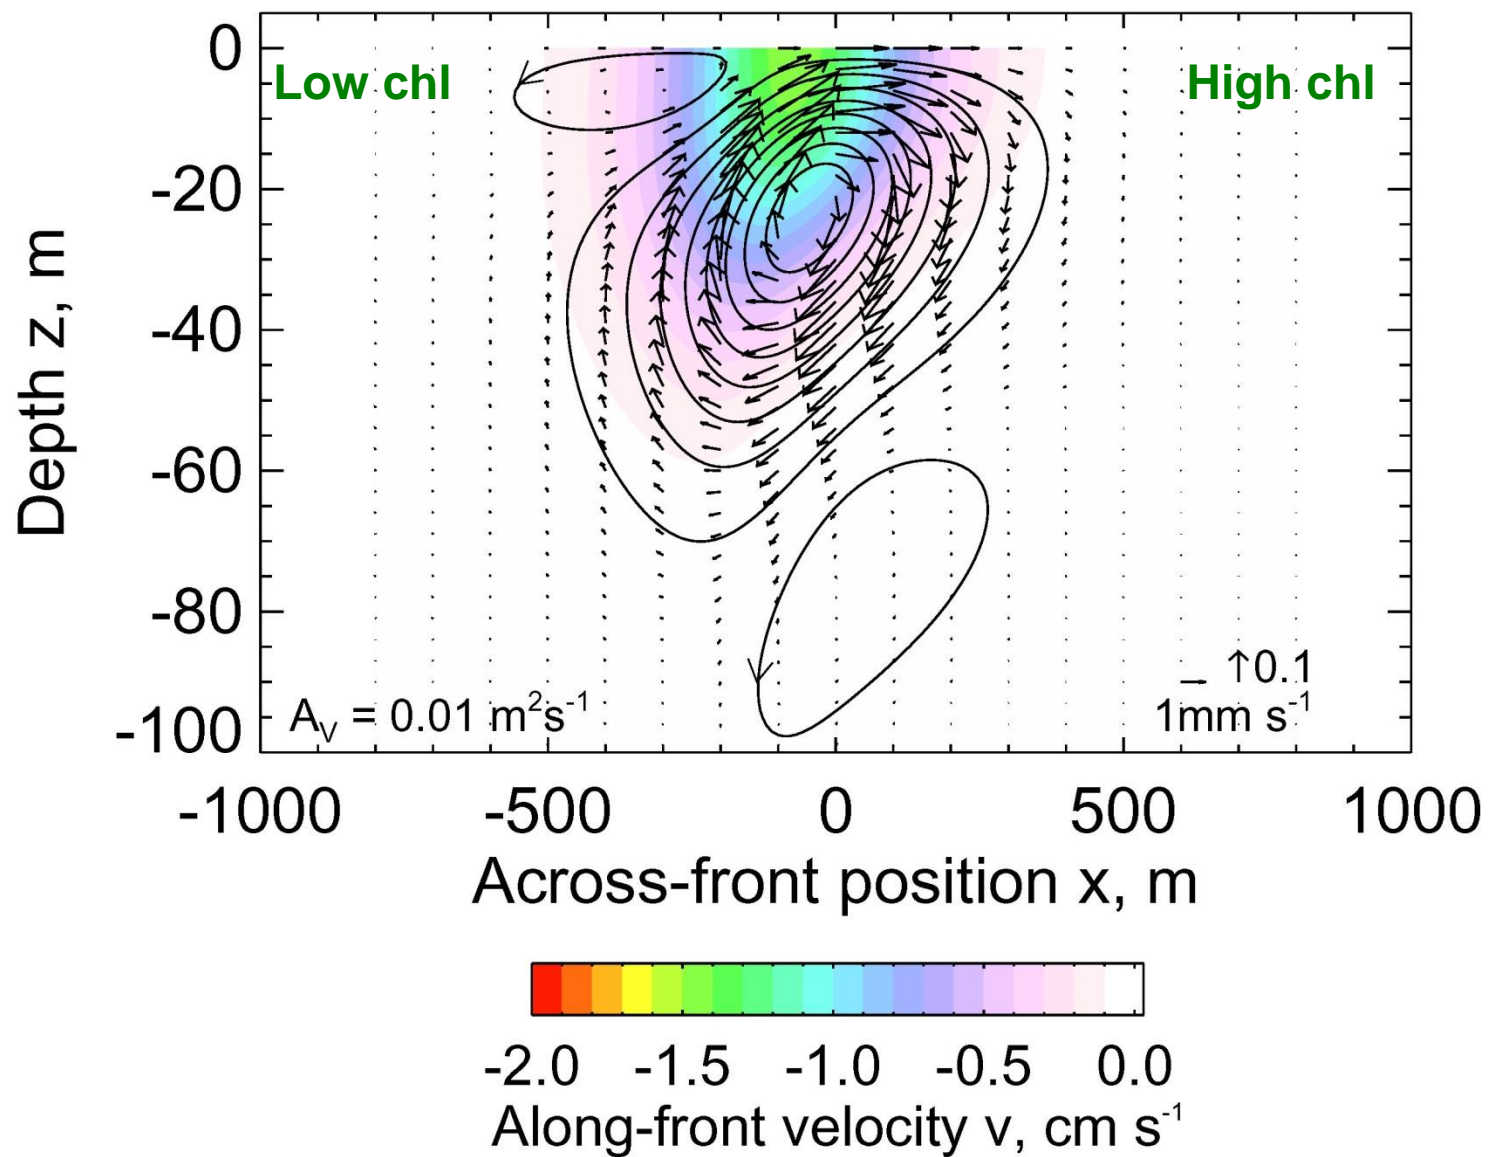

Shallow photic layer
Favours shallow mixed layer

Biologically-induced temperature differences in the ocean

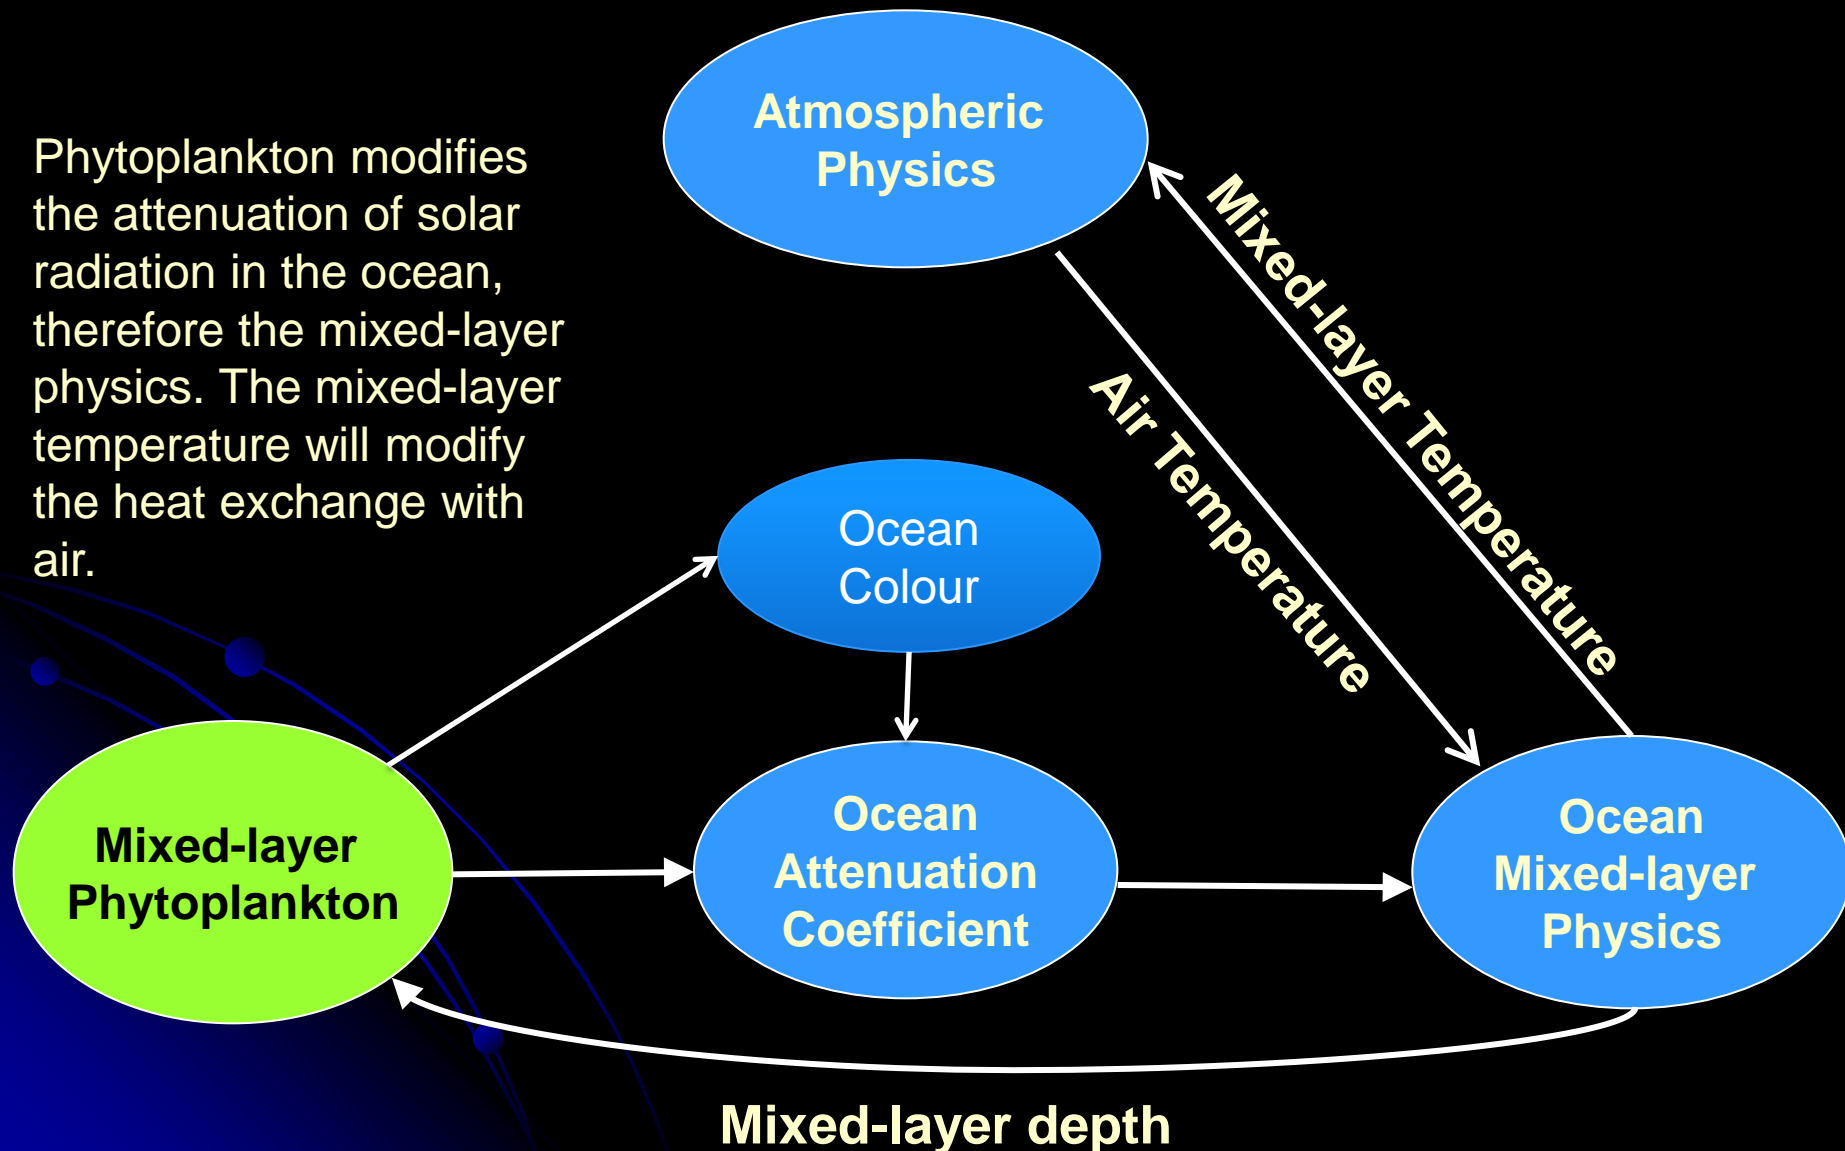

Difference
in SST due
to biologically-
induced change
in K

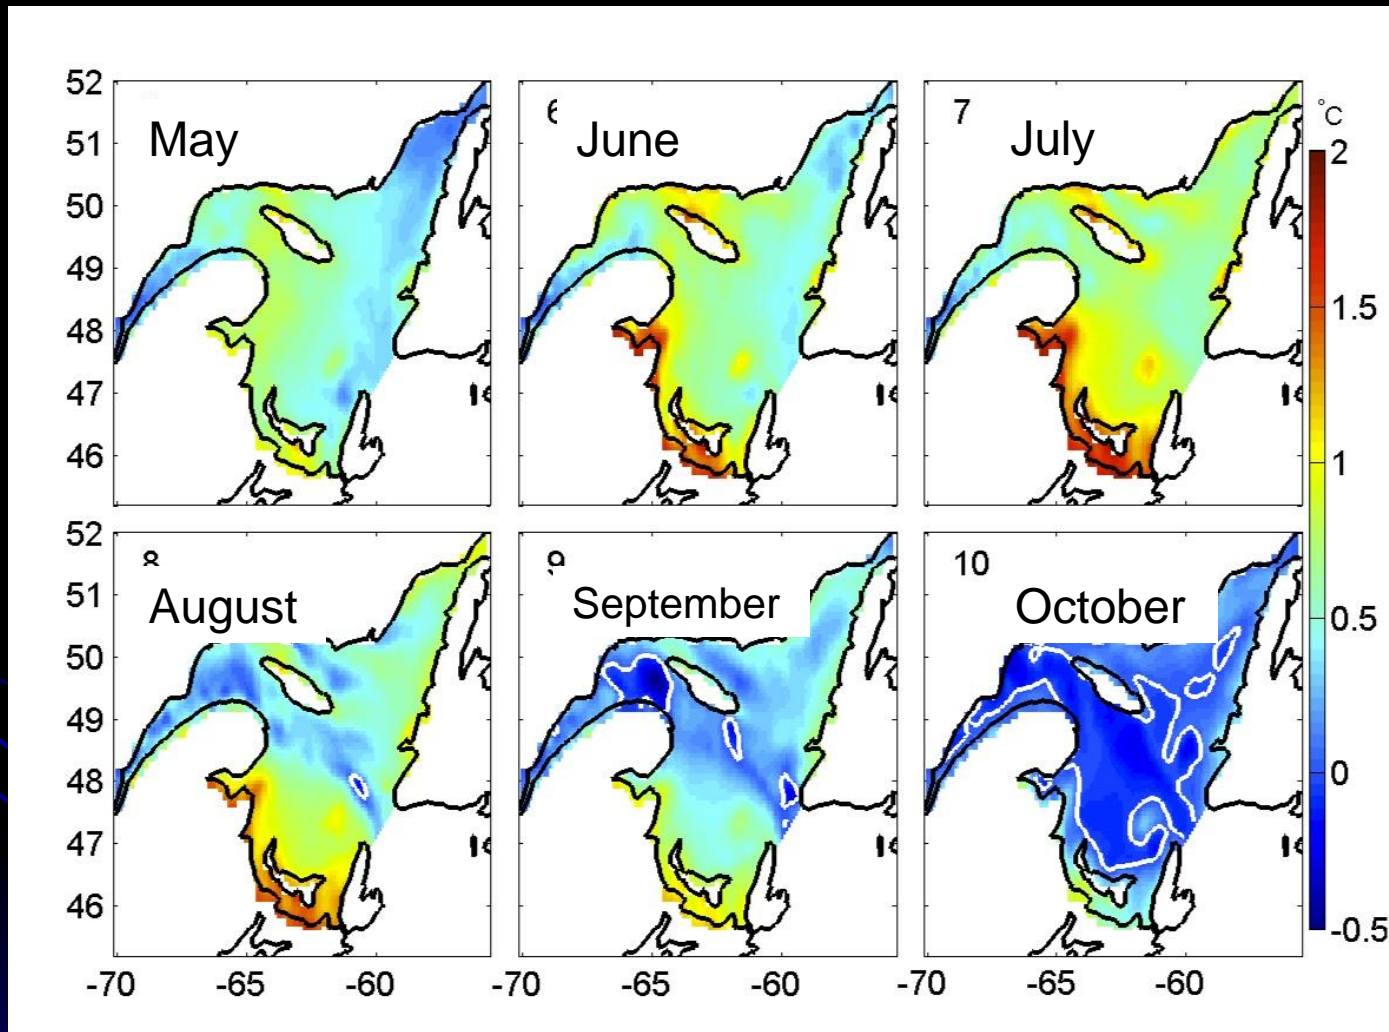

Physical-biological Interactions: Evolution of Mixed-layer Biology, Mixed-layer Physics and Air-sea Heat Exchange

Phytoplankton modifies the attenuation of solar radiation in the ocean, therefore the mixed-layer physics. The mixed-layer temperature will modify the heat exchange with air.

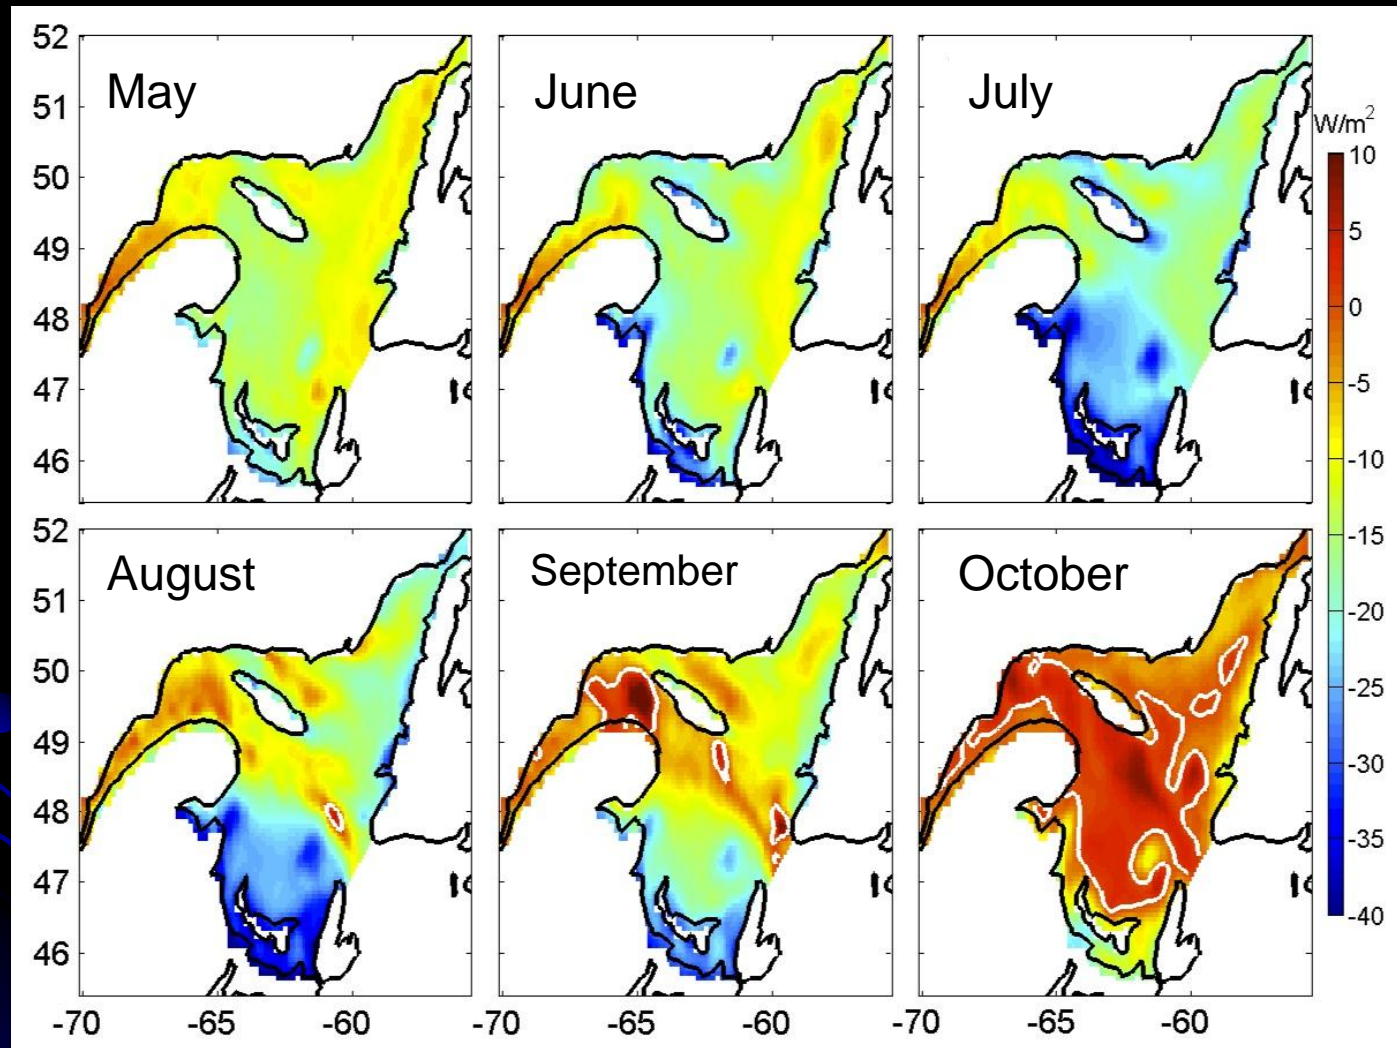

Monthly difference in modelled SST between phytoplankton run and no-phytoplankton runs: Case study for the Gulf of St Lawrence

Zhai et al. 2011

Phytoplankton increases SST by up to 2 ° C, SST differences are determined by the light attenuation associated with phytoplankton and the stratification of water column.

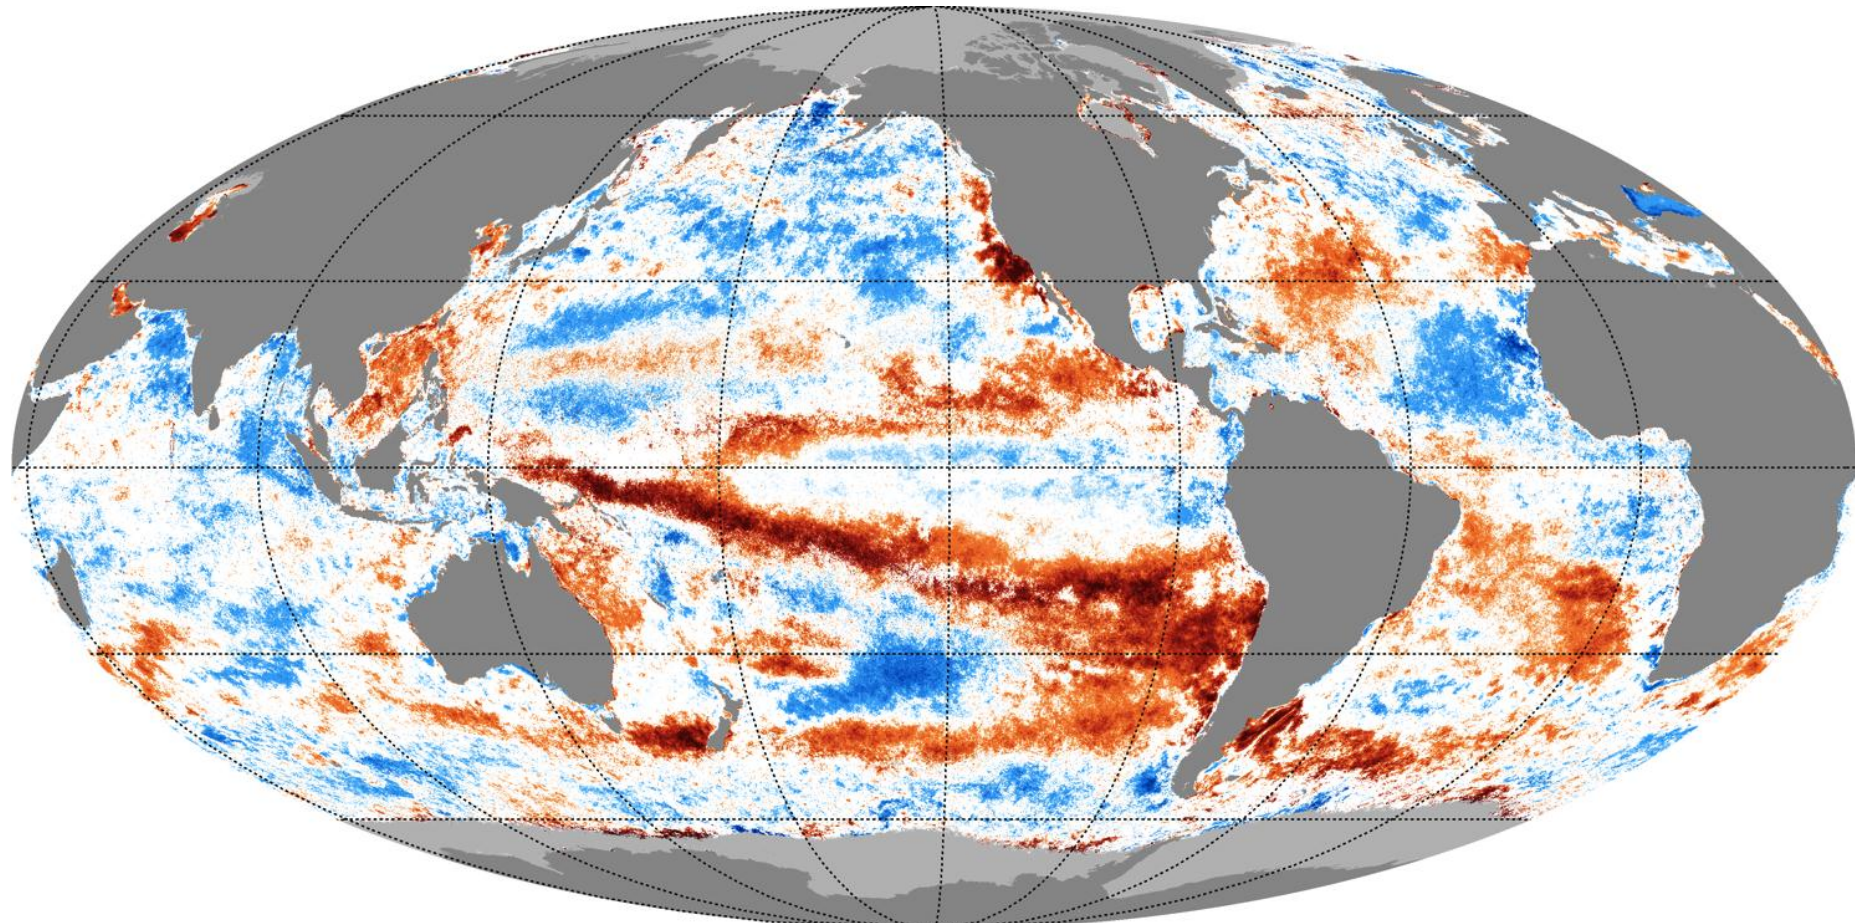

Monthly Difference in Air-Sea Heat Fluxes between Phytoplankton run and No-phytoplankton Run

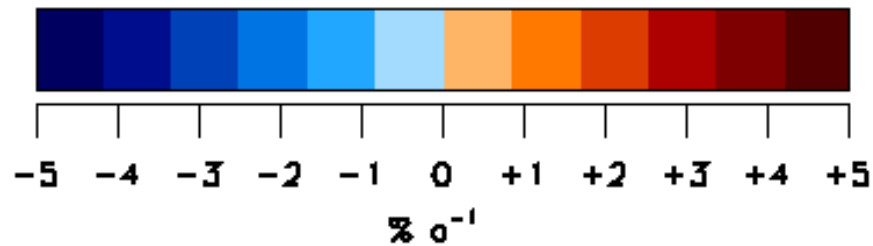

Zhai
et al.
2011

The difference in air-sea heat fluxes is between -40 to 15 W/m^2 . Spatial variation mirrors the difference of near-surface temperature. Phytoplankton enhances the heat loss from the ocean to the atmosphere through mainly latent and sensible fluxes.

Trend Analysis

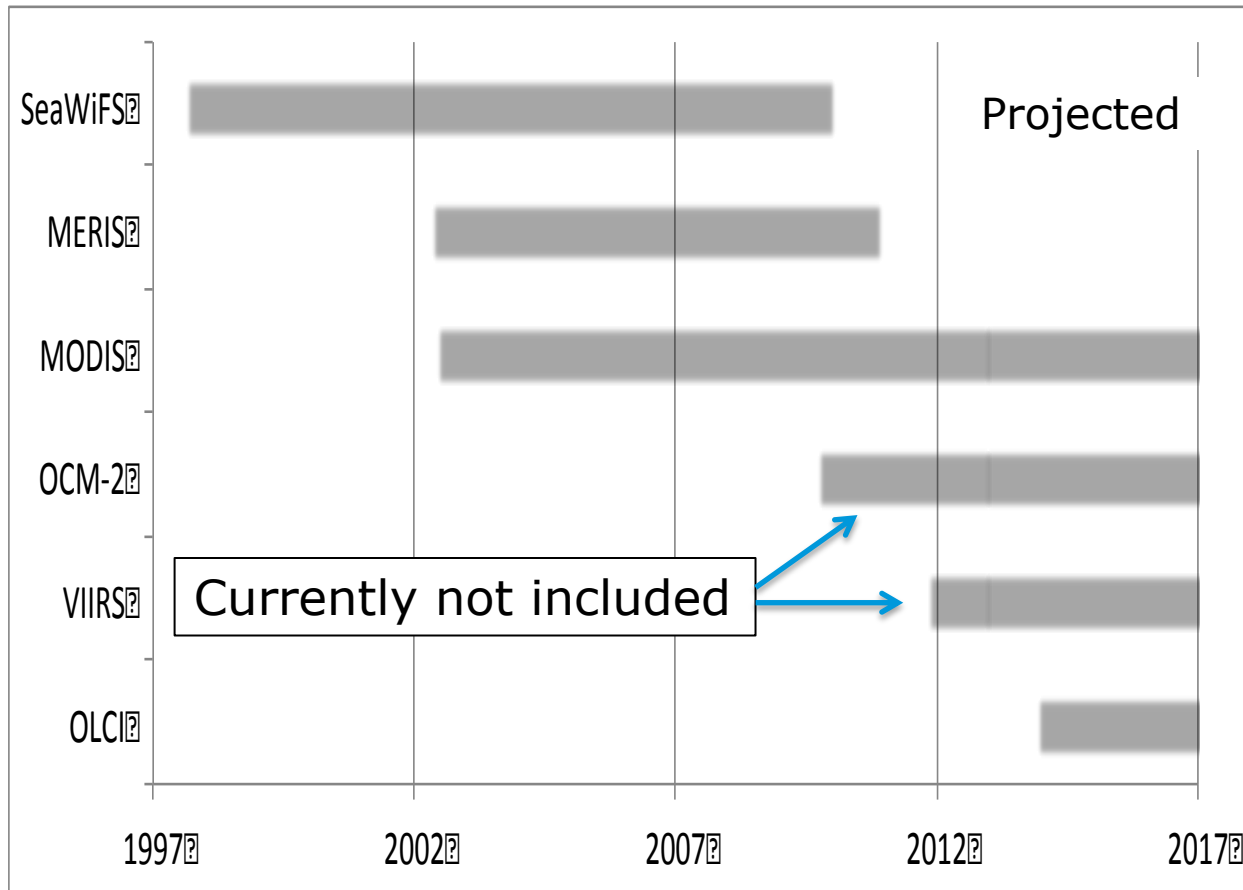

trend [10/1997-09/2012]
 $p < 0.05$

Frédéric Mélin

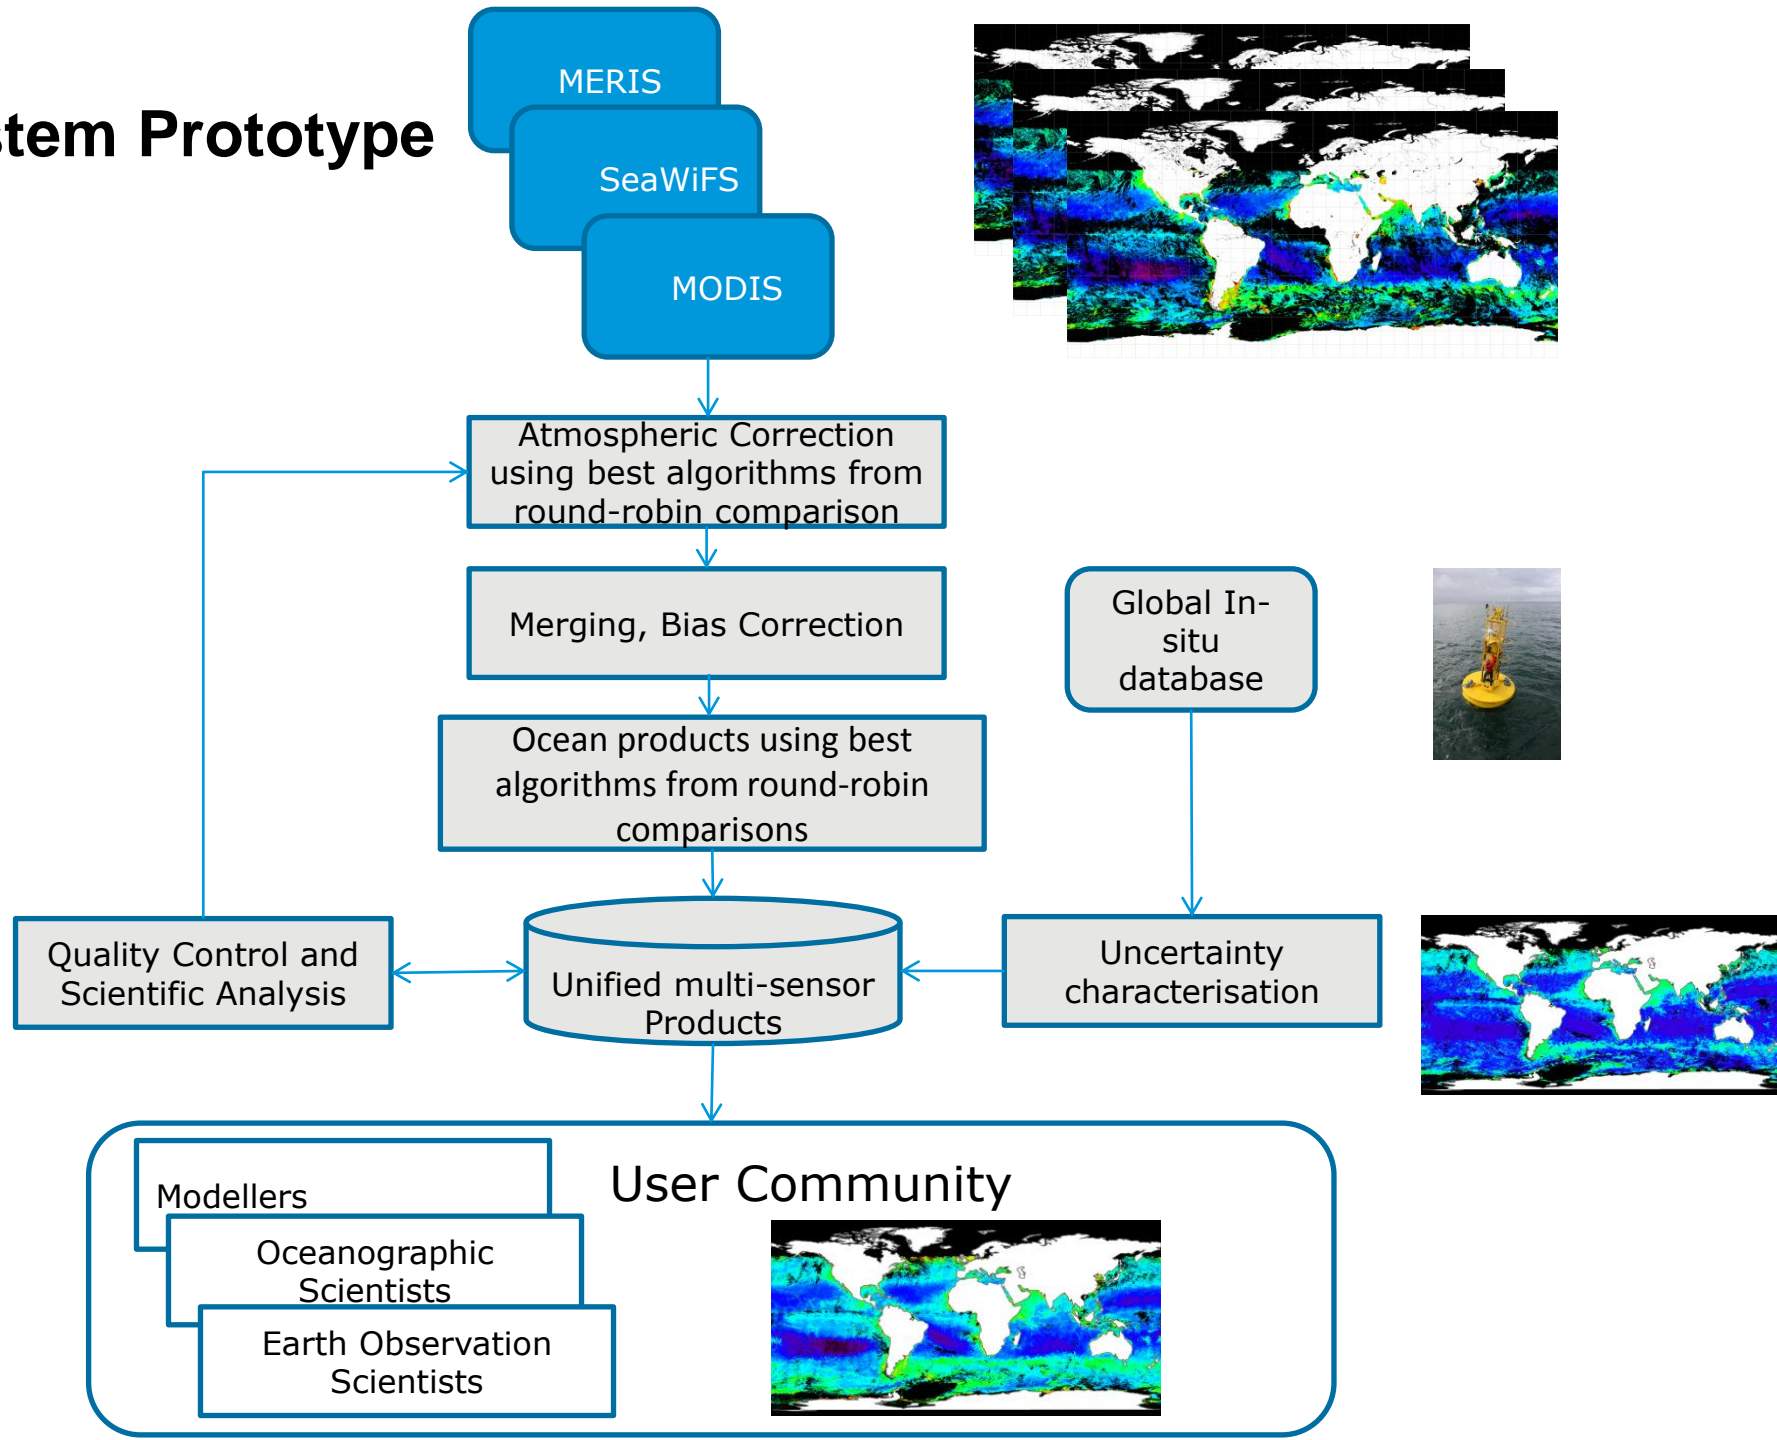

OC-CCI data inputs and time periods

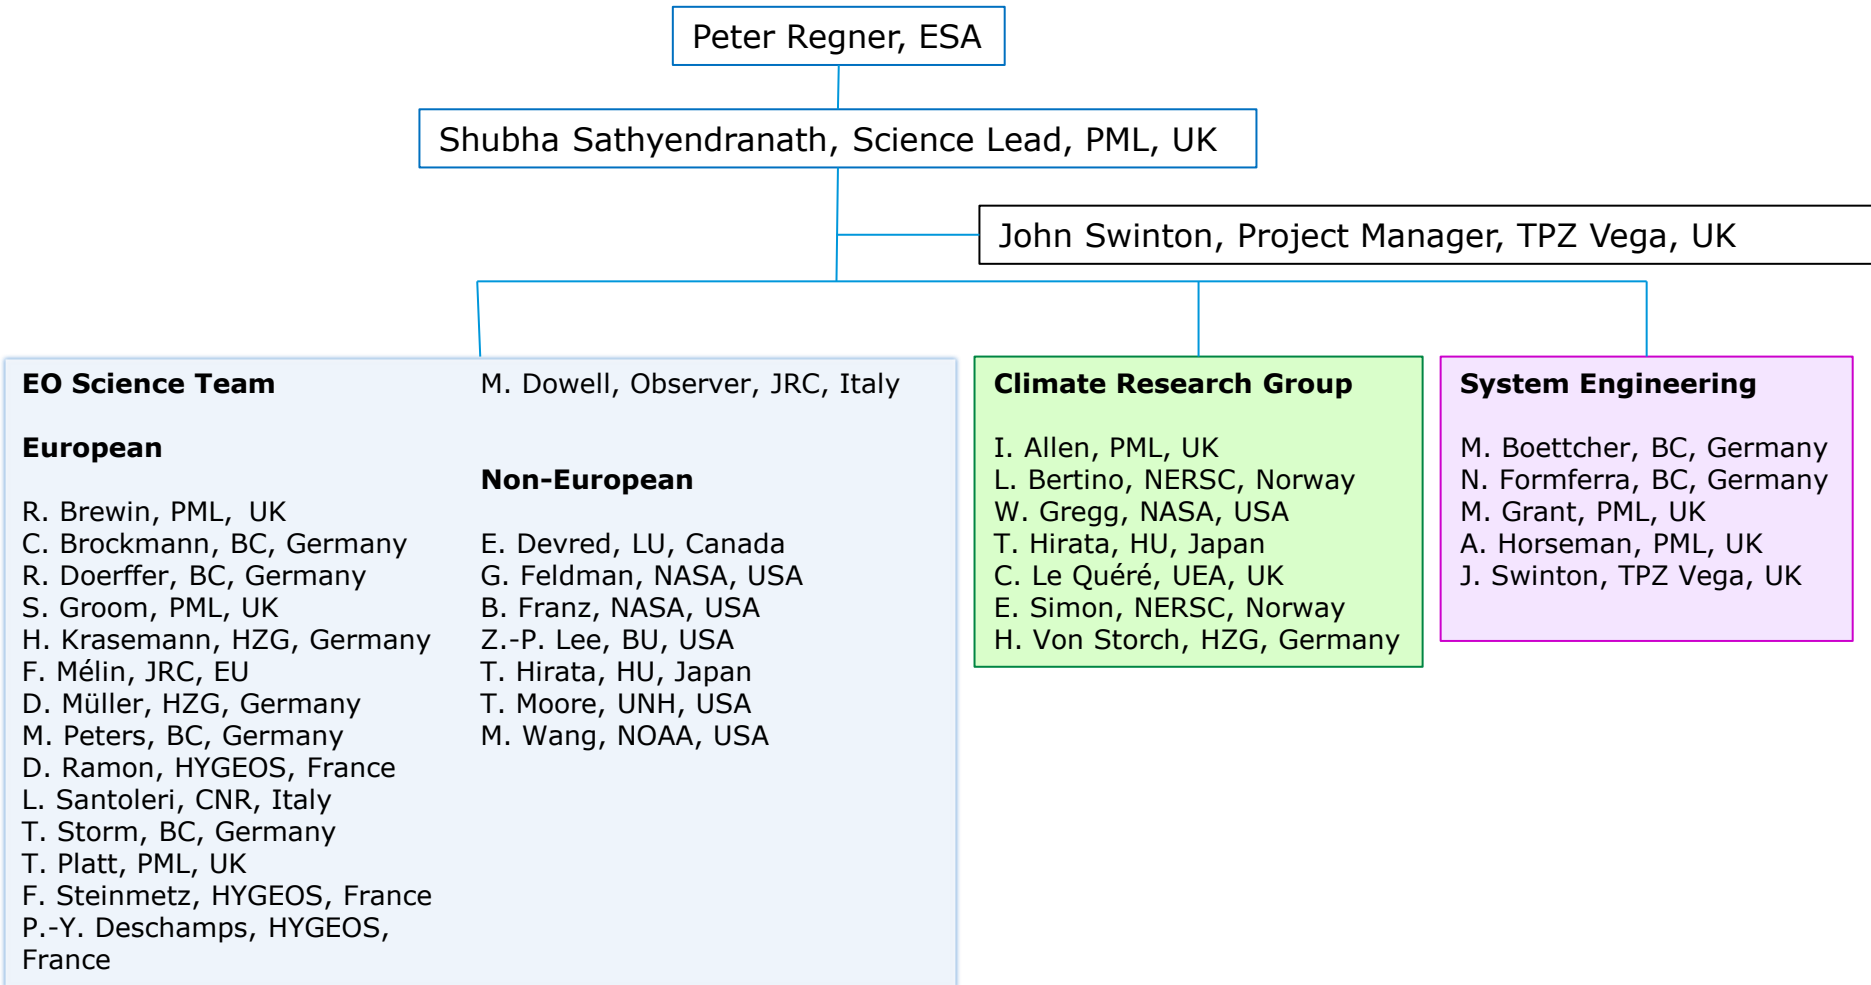

- The period from Feb 2012 until launch of OLCI on Sentinel 3 entirely dependent on MODIS, according to current plan
- Important to add OCM-2 (ISRO) and VIIRS (NASA) to the time series

ECV Product Tables

ECV Product Name: Biogeophysical Products

Parameter	Sensors	Spatial coverage	Spatial grid	Temporal coverage	Temporal resolution	Total Data Volume	Explanatory Text
Phytoplankton Chlorophyll-a concentration (Chl-a) [mg m⁻³] GCOS Climate Variable	MERIS, MODIS, SeaWiFS	Global	4x4km	1997-2012	daily	2 TB	These are level 3 binned, multi-sensor merged, daily composites (primary product, others not listed). Uncertainty layers are also included. This is one of the main OC products.
Water-leaving Radiance at six wavelengths GCOS Climate Variable	MERIS, MODIS, SeaWiFS	Global	4x4km	1997-2012	daily	12 TB	These are level 3 binned, multi-sensor merged, daily composites (primary product, others not listed). Uncertainty layers are also included.
Spectral attenuation coefficient for downwelling irradiance (K_d) [m⁻¹]	MERIS, MODIS, SeaWiFS	Global	4x4km	1997-2012	daily	2 TB	These are level 3 binned, multi-sensor merged, daily composites (primary product, others not listed). Uncertainty layers are also included.
Total absorption (a) and backscattering coefficients (b_b) [m⁻¹] at six wavelengths	MERIS, MODIS, SeaWiFS	Global	4x4km	1997-2012	daily	48 TB	These are level 3 binned, multi-sensor merged, daily composites (primary product, others not listed). Uncertainty layers are also included. This is one of the main OC products.
Coloured dissolved organic matter absorption (a_{CDOM}) [m⁻¹]	MERIS, MODIS, SeaWiFS	Global	4x4km	1997-2012	daily	2TB	These are level 3 binned, multi-sensor merged, daily composites (primary product, others not listed).

- New sensors
- New in situ data
- New algorithms

Initial plan: linear (blue boxes)
New plan: Iterative, continuing science input

Convergence among CCI's
OC-CCI Strong contribution to plan
SRD Well received by ESA

- New algorithms
- New products

**Algorithm
intercomparison**

**Algorithm
selection**

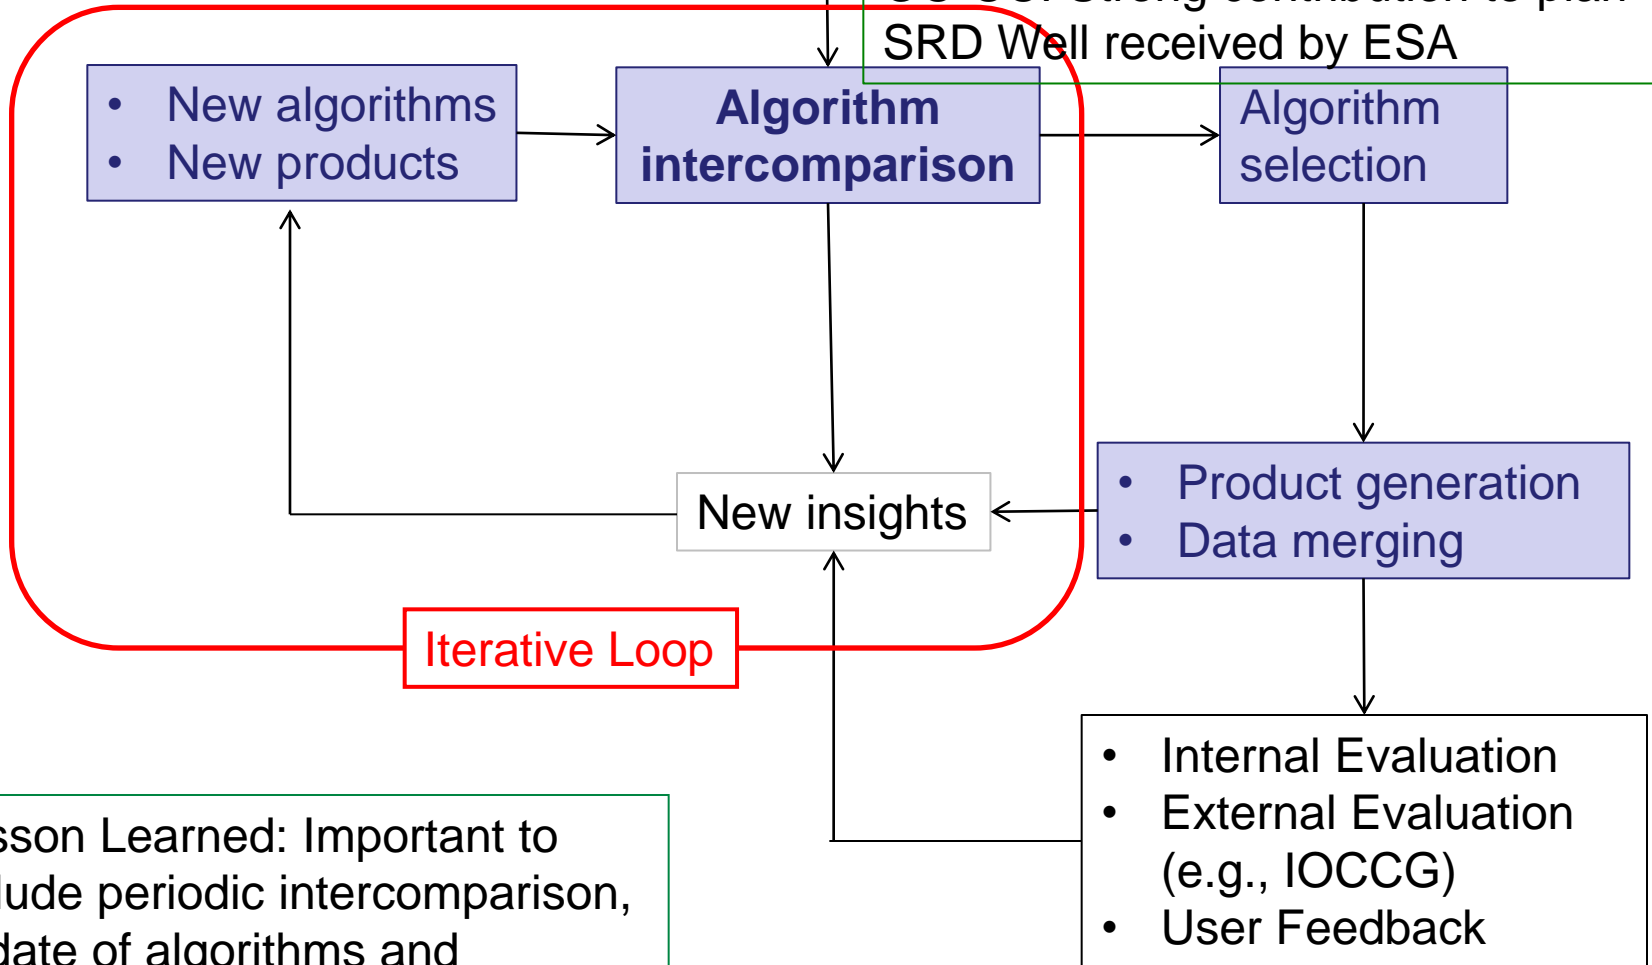

- Product generation
- Data merging

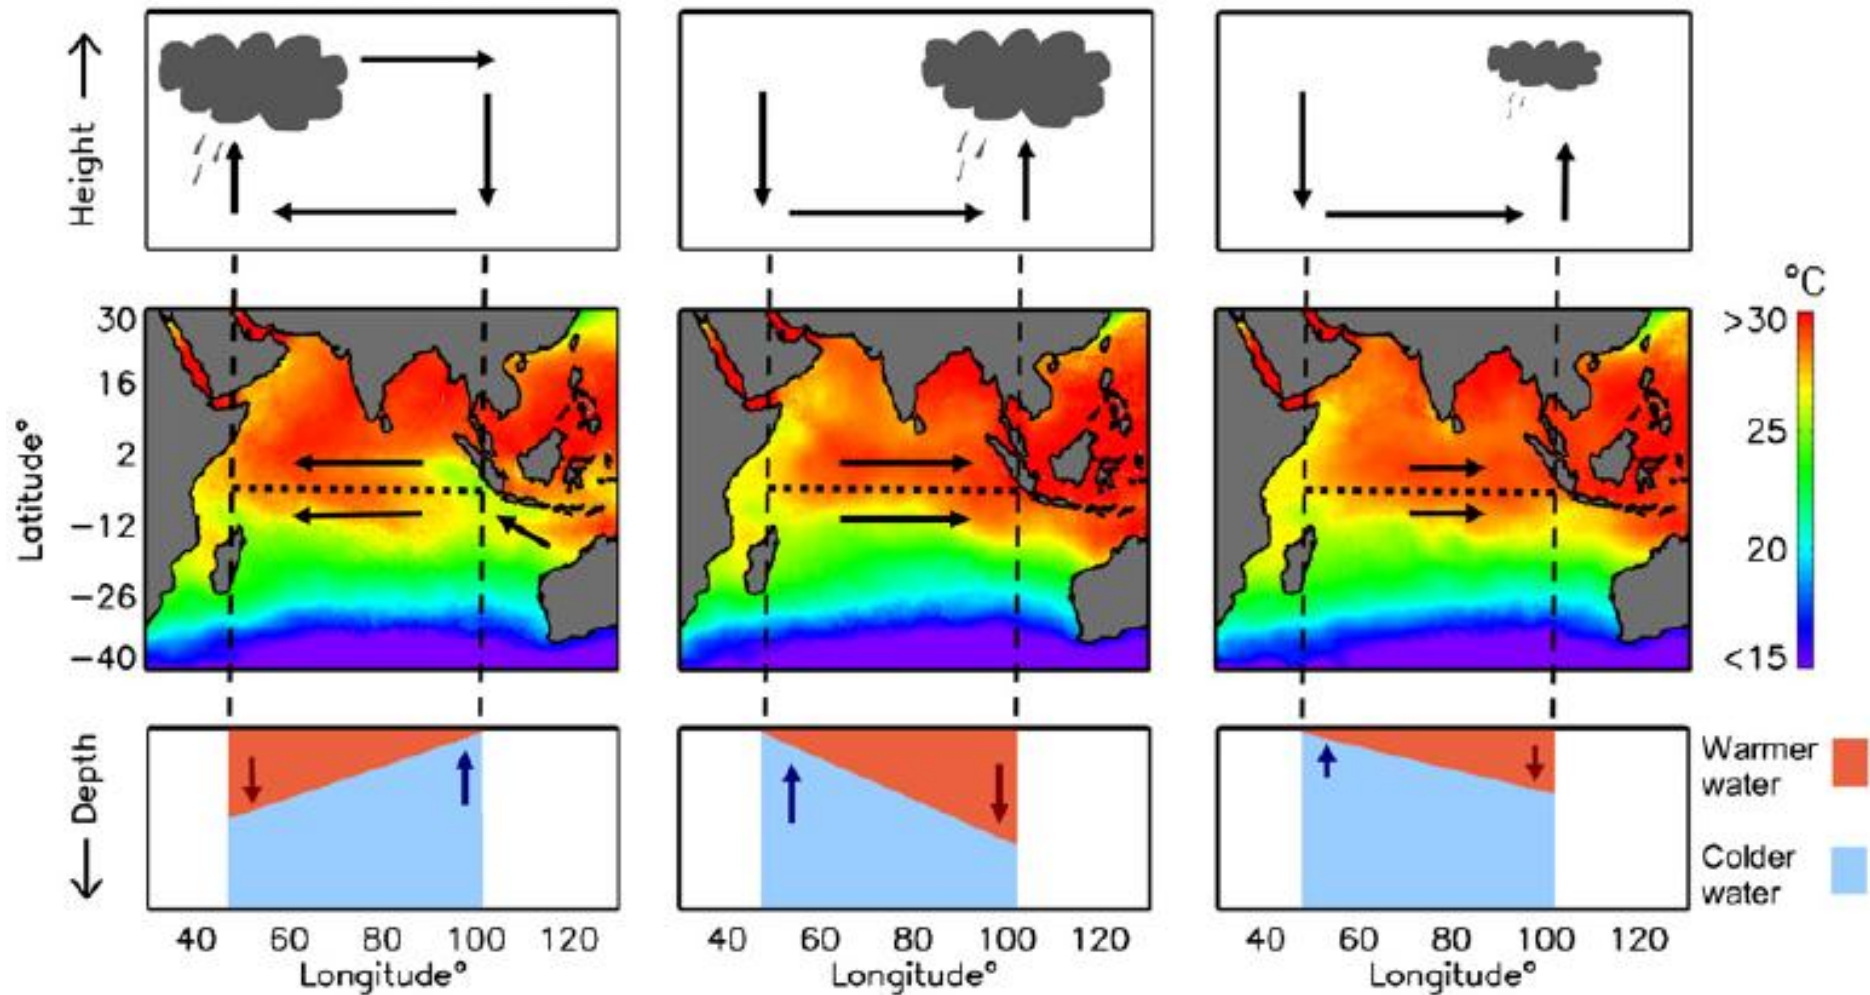

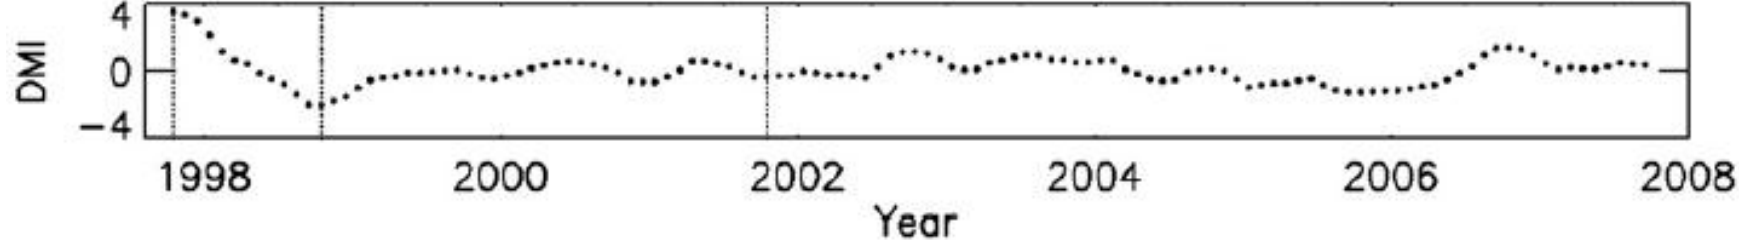

New insights

Iterative Loop

- Internal Evaluation
- External Evaluation (e.g., IOCCG)
- User Feedback

Lesson Learned: Important to include periodic intercomparison, update of algorithms and reprocessing of OC- CCI products as science progresses

Possible mechanism favouring early bloom of phytoplankton

Where number of haddock larvae and biomass of phytoplankton overlap, larvae have food supply adequate for survival.

Where this is not so, larvae are vulnerable to death by starvation.

Early blooms imply a smaller proportion of the total larvae produced at risk from inadequate food supply.

Cushing (Match-mismatch) Hypothesis
