Report on ENVISAT Radar Altimeter - 2 (RA-2) **Wind/Wave Product with Height Information (RA2 WWV 2P)**

By: *Saleh Abdalla*

Date: *26 January 2011*

Overview:

Based on the data received during this month, on average, 18438 observations arrived at ECMWF every 6-hour window of which an average of 7002 observations were rejected initially because of one of the following reasons: being over land, being outside model domain, being a double observation or flagged for rain contamination. On average 76.3% of the remaining part passed the quality control. As can be seen in Figure 1, there was no data gaps in terms of the 6-hour time windows centred at major synoptic times (of 00:00, 06:00, 12:00, and 18:00 UTC) during the whole month. However, there was some significant reduction in data volume during several 6-hour time windows.

Note that we are talking about the raw data which we downloaded in “BUFR” format before they were processed. Some of the data losses was due to delays in the availability of data files on ESA ftp servers.

■ ECMWF Report on ENVISAT RA-2 for December 2010 ■

Quality of Received Data:

For the period covered, the RA-2 Ku-band wave height data are generally of very good quality. The quality of wind speed observations is as good as usual. The MWR products, after removing the ice contaminated observations, are generally in good agreement with the model (wet tropo correction is somewhat smaller than the model). The S-band altimeter has been out of order since 18 January 2008. **The quality of the data is nominal after the change of orbit at end of October 2010.**

Backscatter:

- ENVISAT Ku-band $\langle \sigma^0 \rangle = 11.00$ dB (with main peaks at 10.6 and 10.8 dB).
- ENVISAT S-band: *Not available since 18 January 2008.*

Comparison Summary:

Table 1: Comparison of Surface Wind Speeds:

	RA2 - ECMWF		RA2 - Buoy	
	Bias (m/s)	SI (%)	Bias (m/s)	SI (%)
Global	+0.28	14.4	+0.26	18.0
Northern Hemisphere	+0.52	14.7	+0.36	18.1
Tropics	+0.23	14.9	-0.26	14.9
Southern Hemisphere	+0.17	13.4	----	----

■ ECMWF Report on ENVISAT RA-2 for December 2010 ■

Table 4: Comparison of Wet Tropo Correction and Total Column Water Vapour Values:

	MWR WTC - ECMWF WTC		MWR TCWV - ECMWF TCWV	
	Bias (m)	SI (%)	Bias (kg/m ²)	SI (%)
Global	-0.012	9.9	-0.58	7.8
Northern Hemisphere	-0.010	12.2	-0.64	10.9
Tropics	-0.015	7.7	-0.42	5.6
Southern Hemisphere	-0.011	11.2	-0.64	9.4

Remarks:

- The orbit of ENVISAT was reduced by about 17 km between the 22nd and the 27th of October 2010. It was confirmed that this change has no impact on the RA-2 wind and wave data.
- “Envisat RA-2 (A-Side) S-band transmission power suddenly dropped at 23:23:40 UTC on 17 January 2008”. All S-band parameters are no longer valid since then.
- According to the used land sea mask (which is used for the operational WAM run at ECMWF), about one third of all processed data have been collected over land.
- The rain flag is responsible for the rejection of about **3.0%** of the data this month. Apart from the exceptionally high value of last month (anomaly in the MWR and the rain flag was always set), **this value is relatively high (see Figure**

■ ECMWF Report on ENVISAT RA-2 for December 2010 ■

49; the data point for October 2010 shoots out of the plot). This seems to be due to a proper change in the NRT IPF 6.02L04 processing chain (D. Cotton, 2010; personal communication).

- **The continuously increasing number of rejections from month to month is worrying and an explanation may be needed if this continues.**
- As a result of the implementation of the IPF version 5.02 processing chain, the wind speed product is now limited to a lower value of 1.18 m/s (Figures 4 and 5). This is an expected result as the algorithm was tailored to fit the model and the buoy wind speeds requiring this type of shift. Further adjustment was not found suitable below this value since there is some doubts about the capability of wind with lower speeds to generate any detectable surface water waves. Irrespective of this, the wind speed histogram of Figure 5 compares well with the model counterpart in Figure 6.
- As can be seen in Table 1 and Figures 7-10, the wind speed data are in good agreement with the ECMWF model. ENVISAT wind speed product is globally about 28 cm/s **higher** than the model for this month. On the other hand, it is almost 26 cm/s **higher** than the buoy measurements for this month.
- The Ku-band significant wave heights are almost **unbiased** (lower by ~ 5 cm) when compared to WAM model results (0.4% higher in the NH, 2.8% lower in the Tropics and 1.0% lower in the SH) over the whole month. This is visually clear in the scatter plots of Figures 22-25 (Ku-band - WAM comparisons) and can be inferred from the symmetric slope values of same scatter plots. On the other hand, the RA-2 Ku-band wave heights are about 1.8% **lower** compared to the buoy wave heights for this month as can be seen in Figures 30-32 (Ku-band - buoy comparison). This low bias is due to the implementation of IPF 6.02L04.
- Note that all S-band observations are not valid after the 17th. of January 2008. Therefore, all plots related to S-band should be ignored for this month (although there appears a handful of observations passed the quality control during some months).
- While the MWR derived TCWV is in good agreement with the model counterpart (MWR TCWV is slightly dryer than the model especially in the Extra Tropics), the MWR WTC is still consistently smaller (drier) than the model values.

■ ECMWF Report on ENVISAT RA-2 for December 2010 ■

- There used to be a small cloud (few outliers this month) of TCWV scatter plot outliers hanging below the main cloud at model values between 20 and 30 kg/m² (see Figures 42-45 of monthly reports before February 2010). It used to occur almost anywhere. This group of outliers used to be very clear in the long-period scatter plots. No specific condition or geographical location could be associated with this behaviour. Long-term scatter plots produced (not shown here) for the 9-month period after the implementation of IPF 6.02L04 (since the 2nd of February 2010), as well as the scatter plots for this month show no trace of this issue any more.
- It is important to stress that one needs to keep in mind when making the comparison between the results presented here for the RA-2 and the results presented in the ERS-2 altimeter reports that the ERS-2 plots and statistics are done for super-observations composed of 30 individual observation, while the plots and statistics here are for super-observations with 11 individual observations. Therefore, it is natural for the RA-2 plots and statistics to show a bit more variability.
- ENVISAT RA-2 Ku-band significant wave height and ASAR Wave Mode Level 1b data as well as Jason-1 (blacklisted since the 1st of April 2010) and Jason-2 altimeter significant wave height data are assimilated in the ECMWF wave model.
- ENVISAT RA-2 Ku-Band SWH and ASAR Wave Mode Level 1b products have been, temporarily, blacklisted in the ECMWF model since the late hours of the 21st of October 2010. This was a precautionary measure to ensure that the data quality after the orbit shift is as good as before. After it was clear that this is really the case, the RA-2 SWH was white-listed on the 2nd of December 2010. The ASAR WM product is still blacklisted due to the planned changes in configuration.
- The ECMWF models were not changed during this month. The current operational IFS cycle is CY36R4 (since the 9th of November 2010).
