

# ■ ECMWF Report on ERS-2 RA for September 2002 ■

**Title:** Report on ERS-2 Radar Altimeter wave height and wind speed data.

**By:** *Saleh Abdalla*

**Date:** *8 October 2002*

## **Overview:**

Based on the data received during the full month, on average, 16708 observations arrived at ECMWF every 6 hours of which 2871 were initially rejected as being on land, out of model domain or double observation. On average, 80.5% of the data passed the quality control. The data coverage, which was very good, can be seen in Figure 1. There was no missing data at any time window. Note that we are talking about the raw data which have arrived at ECMWF before they were processed.

The quality of the received data is as good as used to be before January 2000.

## Backscatter:

ERS-2  $\langle \sigma_0 \rangle = 11.12$  dB (with a main peak at 11.1 dB and a secondary peak at 10.6 dB)

## Wind Speed Comparison with ECMWF wind speeds (bias):

ERS-2 global: -0.037 m/s

ERS-2 northern hemisphere: -0.378 m/s

ERS-2 tropics: -0.125 m/s

ERS-2 southern hemisphere: 0.275 m/s

# ■ ECMWF Report on ERS-2 RA for September 2002 ■

## Wind Speed Comparison with buoy wind speeds (bias):

ERS-2 global: -0.829 m/s

ERS-2 northern hemisphere: -0.814 m/s

ERS-2 tropics: -1.025 m/s

## Wave Height Comparison with ECMWF wave heights (bias):

ERS-2 global: -0.013 m (lowest waves measured: 0.6m)

ERS-2 northern hemisphere: 0.068 m

ERS-2 tropics: -0.074 m

ERS-2 southern hemisphere: -0.024 m

## Wave Height Comparison with buoy wave heights (bias):

ERS-2 global: -0.02 m

ERS-2 northern hemisphere: -0.01 m

ERS-2 tropics: -0.17 m

## Remarks:

- The quality of the received Altimeter data is as good as used to be before January 2000.

## Comparison Method:

The Altimeter wave height and wind speed data, as received by ECMWF from ESA through GTS, are the so-called fast delivery products. At ECMWF these data are subject to a quality control method, the details of which are described by Janssen et al. (1989) and Bauer et al. (1992). Consequently, superobservations are formed by averaging 30 consecutive data in order to match the spatial scales of the operational WAM model. Therefore, the collocation statistics are based on the comparison between these superobservations and operational wavemodel products.

In addition, since also wave observations from buoys are received through the GTS, the Altimeter products are also compared against buoy observations. Again, in order to have matching scales, the buoy observations are averaged over a six hour time window. Apart from this, also a height correction is applied to the wind speed observations, since not all buoys observe the winds at the standard height of 10 m. A default observation height of 5 m is assumed, and when available the actual observation height is used. In order to interpolate from the observation height to the standard height a logarithmic wind profile with a roughness length as given by the Charnock relation is assumed, where the Charnock parameter is given the constant value of 0.018.
