ERS-1.WSC.DWP PRODUCT

CCT FORMAT

Dealiased wind field and pressure field

Acronym: **WSC.DWP**

This product contains the wind field reconstructed from the sigma nought data measured by the ERS-1 scatterometer on a grid of 19x19 nodes covering an area of 500 km² and the surface pressure field generated from the computed wind field on the same grid of measure.

The wind field is referred at a height of 10m above the sea level.

The measurements of the sigma nought values are obtained by three antennas pointing in different directions: the mid beam antenna, which illuminates the sea surface in the across satellite track direction and the fore and aft beam antennas which look respectively at an angle of 45° degrees before and after the mid beam. Hence for each point on the sea surface three echo power values obtained from three different angles are used to reconstruct the surface wind vectors (wind speed and direction).

However the grid points on the sea surface may have only two or one sigma nought measurements (incomplete data); this is caused by the blinding of one antenna and by the switching on/off of the scatterometer.

The procedure used to generate the wind field contained in this product is applicable to nodes provided with at least two sigma nought measurements but only if at least one node with three sigma nought measurements is available.

The capability to process nodes with incomplete data is very important in the Mediterranean area where the occurrence of such a kind of data is very high.

The wind field reconstruction algorithm consists of a three-step procedure:

- illuminated area subdivision;
- wind extraction;
- wind field dealiasing.

In the first step, the area of 500 km² that must be processed is divided in Ns sub-areas where a particular node is chosen for the global minimization algorithm to be performed.

In the second step, two different wind vectors are computed for each node of the grid with at least two measurements.

In the third step the ranking of the two candidate solutions is performed so that for each node a rank1 and a rank2 solution is given. According to criteria based on the estimates of the two ranked solutions the ambiguity removal is performed in autonomus mode without using a priori information on the wind field, or in meteorological mode by comparing the two ranked wind fields with an analyzed wind field supplied by meteorological centres.

Besides, together with the wind field the product will contain the surface pressure field computed using the Navier-Stokes equations relating the wind vector field to the pressure field.

The generation of the pressure field is related to some criteria evaluating the percentage of valid nodes that is sea nodes provided with a valid computed wind vector.

The surface pressure field reconstruction procedure consists of the following main steps:

- computation of the pressure gradient approximation from the dealiased wind vector field;
- projection of the pressure gradient into the curl free space (because of the curl free nature of a gradient field);
- extraction of the surface pressure field from the projected pressure gradient field.

1) General CCT structure

The CCT contains the following four files:

Volume Directory File
Leader File
Data Set File
Null Volume File

2) Files description

a) Volume Directory File:

Volume Descriptor Record	360 bytes (mandatory)
Leader File Pointer Record	360 bytes (mandatory)
Data Set File Pointer Record	360 bytes (mandatory)

b) Leader File:

File Descriptor Record	360 bytes (mandatory)
DWP Catalogue Record(s)	1660 bytes (mandatory)

c) Data Set File:

File Descriptor Record	360 bytes (mandatory)
Data Record	8570 bytes (mandatory)
It includes:	one Record Header (20 bytes)
	one Main Product Header (102 bytes)
	one Specific Product Header (144 bytes)
	361 Product Data Set Records (23 bytes)
	spare (1 byte)

d) Null Volume File:

Volume Descriptor Record	360 bytes (mandatory)

CATALOGUE RECORD DEFINITION

Each record is composed of 10 sub-records, each one being able to contain the information relatives to one product. When a sub-record is empty, which is only possible in the last record, it is filled with blanks.

FIELD	BYTES	FORMAT	DESCRIPTION	CONTENT
1	1-4	B4	sequence number	(2,...,n)
2	5	B	1-st subtype	(10)
3	6	B	type code	(30)
4	7	B	2-nd subtype	(33)
5	8	B	3-rd subtype	(50)
6	9-12	B4	record length	(1660)
7	13-16	I4	second sequence number incremented at each record, updated to 1 every time the record type changes	
8	17-20	I4	number of catalogue data per record = 10 maxi	
9	21-30	F10.4	dataset ident	
10	31	I1	raw data quality indicator from 0 (best quality) to 9 (worst quality)	
11	32-37	F6.2	SW latitude in degrees. A negative value denotes south latitude and a positive value, north latitude.	
12	38-43	F6.2	SW longitude in degrees (ie: 0.00-360.00 from Greenwich to East)	
13	44-49	F6.2	SE latitude	
14	50-55	F6.2	SE longitude	
15	56-61	F6.2	NW latitude	
16	62-67	F6.2	NW longitude	
17	68-73	F6.2	NE latitude	
18	74-79	F6.2	Ne longitude	
19	80-82	A3	orbital cycle number	
20	83	A1	orbital sense A = Ascending D = Descending	
21	84-87	I4	orbit number in the cycle varying from 1 to 43 for the 3 days repeat cycle	
22	88-92	I5	revolution number	
23	93-112	A20	start date (DD/MON/YYYY - HH:MI:SS)

4	7-8	I2	number of points with one sigma nought value	n.a.
5	9-10	I2	number of invalid points	n.a.
6	11-12	I2	number of land points	n.a.
7	13-14	I2	number of points with Kp out of range *	n.a.
8	15-16	I2	number of points with wind speed out of range *	n.a.
9	17-18	I2	number of processed points	n.a.
10	19-20	I2	number of rank1 points	n.a.
11	21-22	I2	number of rank2 points	n.a.
12	23-24	I2	number of subdivisions (Ns) *	n.a.
13	25-26	I2	percentage of points with two sigma nought values	0.1%
14	27-28	I2	percentage of points with one sigma nought value	0.1%
15	29-30	I2	percentage of invalid points	0.1%
16	31-32	I2	percentage of land points	0.1%
17	33-34	I2	percentage of rank1 points	0.1%
18	35-36	I2	percentage of rank2 points	0.1%
19	37-40	I4	geographical latitude of product centre negative value: south latitude positive value: north latitude	1.E-4 deg
20	41-44	I4	geographical longitude of product centre (0-360 from Greenwich to East)	1.E-4 deg
21	45-46	I2	rank1 average wind speed	cm/s
22	47-48	I2	rank1 associated wind direction	deg
23	49-50	I2	rank2 average wind speed	cm/s
24	51-52	I2	rank2 associated wind direction	deg
25	53-54	I2	rank1 wind speed standard deviation	cm/s
26	55-56	I2	rank2 wind speed standard deviation	cm/s
27	57-58	I2	column number identifier of zero pressure reference node *	n.a.
28	59-60	I2	row number identifier of zero pressure reference node *	n.a.
29			data per global minimization node (see below) *	

For each point in which the global minimization is performed:
 (Maximum number N_s= 6 points)

FIELD	BYTES	FORMAT	DESCRIPTION	UNITS
1	1-2	I2	sequence number identifier	n.a.
2	3-6	I4	geographical latitude	1.E-4 deg
3	7-10	I4	geographical longitude	1.E-4 deg
4	11-12	I2	wind speed value	cm/s
5	13-14	I2	wind direction value	deg

* Fields description :

Field 1 (Product confidence data)	
bit 8	: Success with autonomous ambiguity removal is obtained if the percentage of rank1 nodes is greater than 70 %.
bit 9	: The pressure field is generated if the percentage of processed nodes is greater than 50%.
Field 7	: The Kp value is out of range if it is greater than 20%.
Field 8	: The wind speed value is out of range if it is less than 4 m/s or greater than 24 m/s.
Field 12	: The number of subdivisions ranges from 1 to 6. A number of subdivisions greater than 1 (Ns=1 : no subdivision) means that the global minimization algorithm used for the data processing is performed a number of times equal to Ns (**).
Field 27,28	: The pressure field values are given with respect to a reference node with zero pressure.
Field 29	: Data relative to each node in which the global minimization is performed (see field 26).

(**) The wind field reconstruction procedure is based on the minimization of the following function:

$$f(w, \phi) = \sum_{k \in \{A\}} p^k [\sigma_0^k - \sigma_0(w, \phi + \alpha^k)]^2$$

where:

{A} : set of antennas giving valid data at the node

w = wind speed at the node

ϕ = upwind direction at the node w.r.t. mid beam direction

α^k = aspect angle of the k- th antenna

p^k = weight assigned to the k- th antenna

σ_0^k = backscattering coefficient measured by the k- th antenna

$\sigma_0(w, \phi)$ = C- band model used for the wind field reconstruction

It is essentially based on a suitable use of two minimization algorithms: a global (GM) and a local (LM) minimization algorithm. A first run of LM algorithm for each grid node is made in order to select the nodes over which running the GM algorithm; the global minimizer is then used as first guess for a second run of the LM algorithm. In this way a first candidate wind field (rank1 wind field) is extracted all over the grid nodes and a second candidate wind field (rank2) is extracted by another run of the (LM) algorithm using as first guess the rank1 wind field pointing in the opposite direction. Finally the ranking of the two candidate wind fields is made and the "ambiguous" wind field is removed. Processing with subdivision techniques means that the reconstruction procedure is repeated for each sub-area (the maximum number of subareas is Ns=6) and that the GM algorithm is runned Ns times. The data of the nodes where the global minimization is performed are contained in field 29.

10	21-22	I2	surface pressure difference of the node and the zero pressure reference node (see fields 27, 28 of SPH)	Pascal
11	23	I1	node subdivision class identifier *	n.a.

* Fields description :

Field 3 (Measurement confidence data)

bit 6,7,8

bit 9

: The Kp value is out of range if it is greater than 20%.

: The wind speed value is out of range if it is less than 4 m/s or greater than 24 m/s.

Field 11

: In case of processing with division techniques it identifies the sub-area to which the processed node belongs; if no subdivision techniques are used it is equal to 1.
