## Change Record

<u>Issue</u>	<u>Revision</u>	<u>Date</u>	<u>Description</u>	<u>Approval</u>
1	0	17/10/96	Initial issue	
1	1	23/10/96	Revised at end of DPDAS phase	
2	0	25/9/96	Complete re-issue	
3	Draft	29/11/96	Draft final specification	
3	0	19/12/96	Final issue	Yes
3	1	06/06/97	Revised following prototyping phase	Yes
3	2	15/10/97	Revision of data flow, new section on neural networks	Yes
3	3	24/11/97	Minor typos corrections; change pages: 3-3, 5-1, 5-2, 6-1, 7-5, 7-19, 7-45 to 7-75, 9-14	No (internal release)
3	4	15/12/97	Revision of neural network interface: 2-6; 5-5, 5-6; 7-52, 7-53, 7-67, 7-77; 9-2 to 9-17	Yes
4	Draft	23/07/98	Major upgrade /revision of all algorithms	
4	0	13/11/98	revision and cleanup; simplification (consolidation, coastal zone); completion (no TBDs)	
4	1	18/12/98	following review (PO-MN-ACR-GS-0026)	Yes
4	2	17/12/99	All pages: revision of document structure and of all algorithms	
4	3	17/12/99	Revision after ESA comments. All pages: supersedes 4.2	
4	4	25/02/00	Case 2 waters products PCD (section 10, p 10-16 & 10-17)	

<u>Page #</u>	<u>Section #</u>	<u>Comments</u>
4	5	07/09/01
		Revision after ESA comments
	3-3	§3.4
		Origin/Destination of Variables clarified
	4-3	§4.4
		Origin/Destination of Variables clarified
	5-6	§5.4
		Origin/Destination of Variables clarified
	5-11	§5.4, table of variables, outputs
		Variables ORINP0_F and OROUT0_F added to list of outputs

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-iv

	5-15	Eq. 2.6.12.1-2	U <sub>03</sub> 4x4 divided by 1000. to convert ozone content in proper unit	
	5-18	§5.5.6	text "table 3.4" changed to "table of variables in section 3.4"	
	6-4	§6.4	Origin/Destination of Variables clarified	
	7-3	§7.4	Origin/Destination of Variables clarified	
	7-4	§7.5.1	text "RD7, 3.1.4" changed to "RD7, 3.17.2.3"	
	8-6	§8.2.2	Origin/Destination of Variables clarified	
	8-13	§8.3.2	Origin/Destination of Variables clarified	
	8-14	§8.3.2	Variable ang_0 changed from type s (specified) to type c (computed)	
	8-16	§8.3.2	Variable SPM <sub>br</sub> (j,f) changed from type o to type c	
	8-16	§8.3.2	Variable ang(j,f) changed from type o to type c	
	8-17	§8.3.2	Variable ia1(j,f) changed from type o to type c	
	8-17	§8.3.2	Variable ia2(j,f) changed from type o to type c	
	8-31	§8.4.2	Origin/Destination of Variables clarified	
	8-31	§8.4.2	Variable μ <sub>s</sub> changed from type i to type c	
	8-31	§8.4.2	Variable μ changed from type i to type c	
	8-61	§8.4.3.8.3	Equations 2.6.9.2.4-10 & -11 added	
	8-76	§8.4.3.13.4.1	"fatab_LUT" -> "f <sub>a</sub> tab_LUT" "oatab_LUT" -> "o <sub>a</sub> tab_LUT"	
	8-86	§8.4.4	Bits 3 and 4 of "ANNOT" flag register added in description	
	8-90	§8.5.4	Origin/Destination of Variables clarified	
	8-91	§8.5.4	"par_LUT" -> "PAR_LUT"	
	9-3	§9.2.2	Origin/Destination of Variables clarified	
	9-4	§9.2.3.1	<b>Endif</b> end of bloc moved

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-v

	9-7	§9.3.1.3	Added description of derivation of aerosol epsilon	
	9-11	§9.3.2	Origin/Destination of Variables clarified	
	9-15	§9.3.2	Variables $\alpha(j,f)$ and $ia(j,f)$ changed from type o (output) to c (computed); variable $\epsilon_{775\_865}(j,f)$ added as type o and $\rho_a(b,j,f)$ as type c	
	9-15	§9.3.3.1	Note added specifying purpose and location of <i>ref_rayleigh</i> procedure	
	9-15	§9.3.3.1	Clarification that LUT interpolations are performed on 4x4 window geometry	
	9-19	§9.3.3.2	Note added specifying purpose and location of <i>ref_aerosol</i> procedure	
	9-20	§9.3.3.2	Equations 2.6.17.4-5 to -8 added for computation of aerosol epsilon	
	9-22	§9.3.3.6.1	Note added specifying purpose and location of <i>ref_aerosol</i> procedure	
	9-26	§9.4.2	Origin/Destination of Variables clarified	
	9-26	§9.4.2 & 9.4.3	Input variable $\rho_G$ from step 2.6.18 (deleted step) changed to $\rho_{top}$ from step 2.6.23	
	10-2	§10.3.1.2.3	Flag construction clarified	
	10-4	§10.4	variables P_CONFIDENCE_F and HIINLD_F of type i added	
	10-4	§10.4	variables TETAS_LIMIT of type s added	
	10-4 & 10-5	§10.4	Origin of Input Variables clarified	
	10-10 & 10-11	§10.5.4	Flag construction clarified	
	10-17	§10.5.13	Fields ABSOA_CONT and ABSOA_DUST of table 10.5.13 updated (now filled from bits of "ANNOT" flag register)	
	12-1 & 12-2	§12	Cloud top pressure corrected to cloud optical thickness & table showing flags corrected accordingly	

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-vi

5	0	14/09/01	Revision after SAG Recommendations	
	<b>Page #</b>	<b>Section #</b>	<b>Comments</b>	
	3-4	§3.5.1	Pressure is corrected for altitude only for land pixels (otherwise coastal pixels or small islands may get as altitude their bathymetry).	
	4-6	§4.5.2	Albedo for not land pixels is set to 0.	
	8-91	8.5.4	InvAbs_Ch12[2] and InvScat_SPM added as auxiliary parameters	
	8-98 8-99	§8.5.5.4.2	Case 2 IMT Neural Network computes optical properties that are latter converted to concentrations using aux. Param.	
	All pages of §9	§9	Infrared band is replaced by red band and Thresh_infr2nrinfr is renamed Thresh_nir2red	
	9-3, 9-4, 9-5, 10-14, 10-15	§9.2.2 §9.2.3.1 §10.4 §10.5.9	The two bands of rectified reflectances are made available in the L2 product	
	10-17, 10-18	§10.5.13	WATER_CLASS, LAND_CLASS, and CLOUD_CLASS are taken into account in the PCD_16 and PCD_17 computations	
	5-6, 5-8	§5.4	TOAR(b,j,f) as input param.; SATURATION_L(b) as aux. Param.	
	10-5, 10-6	§10.4	TOA radiances, rectified reflectances for red/near infrared bands are added as input parameters. Scaling factors and offsets for rectified reflectances, as well as radiance saturation levels are added as auxiliary parameters. Radiance saturation flag is computed.	
	5-11,5-12, 10-12, 10-17, 10-18	§5.5 §10.5.6 §10.5.13	PCD computations and exceptions are adjusted using radiance saturation levels.	
	12-1, 12-2	§12	Include Cloud Top Pressure MDS in MER_RRC_2P and MER_LRC_2P

 Issue : 8 Rev : 0B  
 Date : 24 June 2011  
 Page : 1-vii

5	1	26/07/02	Revision after Trouble-shooting activities
	Page #	Section #	Comments
	5-9, 5-15, 5-16	§5.5.4	Gaseous corrections performed in reflectances instead of radiances
	10-6	§10.4	Table showing input parameters to product formatting (Table 10.4-1) shows the band to be considered in the formatting (blue_band_N, boavi_red_band, etc.) (SPR-3L000-1060-GMV)
	8-99	§8.5.5.5	Note has been added saying that the ozone indexing values for the PAR LUT should be scaled to reflect the unit of the ozone used in the processing (SPR-3L000-1062-GMV)
	8-21	§8.3.3.4.2	The criteria of linear system degeneration (Eq. 2.6.10.2-15) is more explicit ( $\det < 1.e-9$ ) (SPR-3L000-1063-GMV)
	9-15 to 9-24	§9.3.3	Replaced $\theta_s$ by $\theta_{s\_4x4}$ to remove any ambiguity (same for $\theta_v$ , $\Delta\phi$ and M)
	8-9	§8.2.3.1	Corrected bands on which to perform the glint correction
	8-72	§8.4.3.12.3	Modified exception processing condition and added Note for bands not shown
	8-37	§8.4.3.1.3	Call to <b>Process initialisation</b> function moved
	8-63	§8.4.3.9.3	<b>Final_couple</b> function consolidated
	8-79 and 8-80	§8.4.3.13.6	$\mu_s$ removed from function call and table of variables because not used
	8-57	§8.4.3.7.3	Computation of $\tau_a(b865)$ specified and call to <b>Denormaliser</b> function corrected
	8-53	§8.4.3.6.2	$\tau_{a\_loc}$ replaced by $\tau_{a\_865}$ for clarity
	8-82	§8.4.3.13.8.2	Added comment for clarity
	8-74	§8.4.3.13.2.2	Clarified exception handling
	8-75	§8.4.3.13.3.2	Clarified exception handling
	8-34	§8.4.2	Added ORINP0 F(j,f) in table

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-viii

6	0	8/11/02	Revision after verification activities	
	Page #	Section #	Comments	
	1-4, 1-8	1.3	Update of tables 1.3-1 & 1.3-2 for new algorithms steps in sections §4 & §5 and for sub-sections re-numbering in section 4	
	3-3, 3-5	§3.4 & §3.5	Modification of TOA reflectance computation: use of per pixel Sun irradiances (selected using the MERIS Detector index now carried along in the Level 1b flags MDS instead of the spectral shift) instead of mean values.	
	4-3 to 4-8	§4.4 & §4.5	Improvement of pressure estimations: surface pressure is linearly interpolated between the results of two polynomials, CTP neural net now takes b761 wavelength as input.	
	5-2, 5-4 to 5-10, 5-14 to 5-17, 5-21	§5.4 & §5.5	Addition of a reflectance correction for Smile Effect, modification of TOA radiance passed to §6 & §7	
	8-9	§8.2.3.1	MEDGLINT_F flag set to TRUE when high glint to pursue the glint correction even above the highest glint threshold	
	8-72 8-80	§8.4.3.12 §8.4.3.13.6	Calls to <i>transmittance_d</i> replaced by additional calls to <i>transmittance_up</i>	
	8-97	§8.5.5.3	ORINP1 not positioned anymore in Equations 2.9.6-6 and 2.9.6.8	
	10-17 and 10-18	§10.5.13	MIXR1 removed from the construction of PCD_1_13, PCD_15, PCD_18 and PCD_19	
	10-17 and 10-18	§10.5.13	CASE2_ANOM removed from the construction of PCD_15	
	11-1	§ 11	Added smile corrected reflectance to breakpoints

**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-ix

6	1	28/03/03	Revision after first Validation Results	
	Page #	Section #	Comments	
	5-7 & 5-17	5.5	Modified steps 2.6.26-4 & -5 using additional variables read from auxiliary products	
	6-4, 6-6 & 6-7 8-3, 8-6, 8-7, 8-9 & 8-10	6.4 & 6.5 8.2.2 & 8.2.3	Water vapour processing now uses a dedicated high glint flag (instead of one of the water processing ones previously. To minimise modification impact, computation of new flag has been kept within water processing. )	
	8-8	8.2.3	Computation of angular distance between wind and Sun directions modified (step 2.6.5.11-2)	
	8-13, 8-14 & 8-18	8.3.2 & 8.3.3	Use of a threshold on pixel altitude (bathymetry) to force CASE2_F flag for shallow waters	
	8.57 8.69 8.79	8.4.3.7.3 8.4.3.11.3 8.4.3.13.4.2	Use of weighted averages for aerosol couples properties computations	
	8-74 to 8-77	8.4.3.13.2 8.4.3.13.3	Modified interpolation scheme for the $\rho_{\text{path}}/\rho_{\text{R}}$ LUT for both direct and inverse use.	
	9-3 9-4 & 9-5	9.2.2 9.2.3	New flags defined to sort out pixels within TOAVI processing, those explaining algorithm failure are passed to formatting.	
	10-5 & 10-18	10.4 10.5	Addition of TOAVI dedicated Science Flags to table 10.5.13	

6	1a	16/05/03	Revised after comments on issue 6.1	
	Page #	Section #	Comments	
	4-6	4.5	Typo corrected in step 2.1.3.-3	
	4-7	4.5	Exception processing corrected in step 2.1.12-5	
	8.75	8.4.3.13.2	Exception processing updated	
	9.4	9.2.3.1	Applicability of exception processing extended	
	9.5	9.2.3.1	Additional exception processing

**Date** : 24 June 2011  
**Page** : 1-x

7	0	18/06/04	Algorithm revisions from validation inputs	
	Page #	Section #	Comments	
	4-7	4.5.3	Exception processing after step 2.1.12-4 deleted	
	5-7, 5-9, 5-10	5.4	Additional <i>s</i> and <i>c</i> types variables for upgraded gas absorption correction (§ 5.5.4, step 2.6.12)	
	5-9, 5-10	5.4	Additional <i>c</i> and <i>o</i> types variables for upgraded Land identification (§ 5.5.4, step 2.6.26)	
	5-17 to 5-19	5.5.4	Upgraded gas absorption correction (step 2.6.12)	
	5-20 to 5	5.5.5	Upgraded Land identification (step 2.6.26)	
	6-4	6.4	Additional <i>i</i> type variable, modified <i>s</i> type LUT (one additional dimension) for upgraded Water Vapour retrieval over Ocean (§ 6.5.1, step 2.3.2)	
	6-6	6.5.1	upgraded Water Vapour retrieval over Ocean (§ 6.5.1, step 2.3.2): LUT of polynomial coefficients now includes a wind speed dimension	
	8-1	8.1	Epsilon product replace by Angström exponent	
	8-2	8.1	Revised overall block diagram	
	8-3	8.2	A note on transfer of Glint reflectance computation to §5 has been added.	
	8-4	8.2	Description of new step 2.6.5.4	
	8-5, 8-6	8.2.1	Revised flowcharts 8.2-1 & 8.2-2	
	8-7, 8-8	8.2.2	Additional <i>i</i> , <i>s</i> , & <i>c</i> type variables to account for deletion of and addition of step 2.6.5.4	
	8-8, 8-9	8.2.3.1	Steps 2.6.12.1-5 to -8 and 2.6.5.1.1 deleted (actually moved to §5.5.4, step 2.6.26)	
	8-9	8.2.3.1	Step 2.6.5.1.8-2 added	
	8-10	8.2.3.4	Step 2.6.5.4 added as new section 8.2.3.4	
	8-13 to 8-21	8.3	Implementation of ATBD 2.6 totally reviewed	
	8-25	8.4.1.2	Test on atmosphere correction error at 705 deleted	

# MERIS ESL

Doc : PO-TN-MEL-GS-0006  
Name: MERIS Level 2 Detailed Processing Model  
Issue : 8 Rev : 0B  
Date : 24 June 2011  
Page : 1-xi

8-27	8.4.2	Symbolic value CONT_LIKE renamed as BLUE_LIKE to reflect changes in aerosol classes	
8-30	8.4.2	Output parameter $\epsilon_{775\_865}(j,f)$ replaced by $\alpha_{775\_865}(j,f)$	
8-33	8.4.3.1.2	Output parameter $\epsilon_{775\_865}(j,f)$ replaced by $\alpha_{775\_865}(j,f)$	
8-35	8.4.3.3.1	Flowchart updated (test on CASE2_S flag replaced by test on BPAC_ON_F flag)	
8-36	8.4.3.3.2	CASE2_S replaced by BPAC_ON_F	
8-37	8.4.3.3.3	CASE2_S replaced by BPAC_ON_F	
8-38	8.4.3.4.1	Flowchart updated (test on absorbing aerosols by-passed when CASE2_S flag is set)	
8-39	8.4.3.4.1	Flowchart updated ( $\epsilon_{775\_865}$ replaced by $\alpha_{775\_865}$ )	
8-41	8.4.3.4.2	Output parameter $\epsilon_{775\_865}(j,f)$ replaced by $\alpha_{775\_865}(j,f)$	
8-42	8.4.3.4.3	Step 2.6.9.2-10 updated (test on absorbing aerosols by-passed when CASE2_S flag is set)	
8-45 to 8-47	8.4.3.5.2 & 8.4.3.5.3	Classification of aerosols modified, hence climatology switches	
8-47	8.4.3.5.3	Revision of aerosol database classes and scan logic	
8-51	8.4.3.7.1	Flowchart updated (b705 no more used)	
8-52, 8-53	8.4.3.7.2	New <i>i</i> , <i>s</i> & <i>c</i> type parameters related to	
8-53, 8-54	8.4.3.7.3	b705 no more used	
8-54	8.4.3.7.3	Computation of climatologic water leaving radiance at 510 nm	
8-55	8.4.3.8.1	Flowchart updated (b705 no more used)	
8-56	8.4.3.8.2	New <i>i</i> , <i>s</i> & <i>c</i> type parameters related to climatology of $\rho_w(510)$ , parameters related to b705 deleted, aerosol classes updated	
8-57	8.4.3.8.3	Algorithm revision: use climatology of $\rho_w(510)$ , do not use b705 anymore	
8-59	8.4.3.9.2	parameters related to b705 deleted, new parameter related to revised aerosol classes

**Date** : 24 June 2011  
**Page** : 1-xii

8-59, 8-60	8.4.3.9.3	b705 no more used, new steps for setting bits AERO_B and ABSO_D of ANNOT flag register
8-62, 8-63	8.4.3.10.2 & 8.4.3.10.3	Updated after revision of aerosol database classes
8-64	8.4.3.11.1	Flowchart updated ( $\epsilon_{775\_865}$ replaced by $\alpha_{775\_865}$ )
8-65	8.4.3.11.2	$o$ type parameter $\alpha_{775\_865}$ (j,f) replaces $\epsilon_{775\_865}$ (j,f), new $s$ type parameter needed for its computation
8-66	8.4.3.11.3	Computation of $\alpha_{775\_865}$
8-68	8.4.3.12.3	Exception processing modified
8-84	8.4.4	ANNOT flag register description updated
8-84	8.4.5	$\alpha_{775\_865}$ replaces $\epsilon_{775\_865}$
8-86	8.5.2	Flowchart updated ( $\epsilon_{775\_865}$ replaced by $\alpha_{775\_865}$ )
8-88	8.5.4	$i$ type parameter $\alpha_{775\_865}$ replaces $\epsilon_{775\_865}$ )
8-89	8.5.4	New $s$ & $c$ type parameters supersedes old ones for anomalous scattering detection
8-89	8.5.4	Additional $s$ type parameters for case2 IMT NN
8-95	8.5.5.3	Step 2.9.6 fully revised
8-96, 8-97	8.5.5.4.2	Case2 IMT NN inputs checks and transformation modified
8-97	8.5.5.5	PAR computation uses $\alpha_{775\_865}$
9-7	9.3.1.2	Blue band used in DDV screening (step 2.6.13) changed to 442
9-11, 9-12	9.3.2	Description of some $s$ type variables aligned to cope with increased aerosol data base size
9-12	9.3.2	New $s$ type variables
9-13, 9-14	9.3.2	New or modified $c$ type variables
9-15	9.3.2	$o$ type variable $\epsilon_{775\_865}$ replaced by $\alpha$
9-17	9.3.3.2	Blue band used in DDV screening (step 2.6.13) changed to 442
9-17	9.3.3.2	New steps 2.6.13-10 & -11
9-17	9.3.3.2	DDV flag setting modified
9-18 to 9-20	9.3.3.3	Pseudo-code aligned to cope with increased aerosol data base size

**Page** : 1-xiii

	9-20		Step 2.6.17.4-14 renumbered to 2.6.17.4-10, new steps 2.6.17.4-11 to 2.6.17.4-16 added	
	9-20, 9-21	9.3.3.3	output $\epsilon_{775\_865}$ replaced by $\alpha$ , corresponding exception processing revised	
	9-22	9.3.3.4	All steps within procedure calc_robar_ag renumbered for clarity	
	9-23	9.3.3.5	All steps within procedure calc_robar_ra renumbered for clarity	
	9-24 to 9-26	9.3.3.6	Procedure top_of_Rayleigh_ref deeply revised, including new <i>i</i> and <i>s</i> type variables. All steps within the procedure renumbered for clarity.	
	9.28 to 9.29	9.4	Whole section revised following complete algorithm change	
	10-3	10.3.1	Description of MDS 19 aligned with Angström exponent replacing epsilon	
	10-3	10.3.1	MDS width (pixels) for FR Full swath product added	
	10-4, 10-5	10.4	New/modified <i>i</i> parameters	
	10-17, 10-18	10.5.13	Table 10.5.13 modified	
	11-2, 11-3	11	New/modified breakpoints fields	
	12-1	12	Clarification on Water Vapour averaging	
	Annex A	All	Parameters Data List reviewed	

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-xiv

7	1	28/02/05	Algorithm revisions from validation inputs	
	Page #	Section #	Comments	
	8-13	8.3.1.2	Addition of the White Scatterer Identification to Step 2.6.8.2	
	8-16	8.3.2	Additional <i>s</i> and <i>c</i> type variables	
	8-17	8.3.2	Additional <i>o</i> type variable	
	8-18 & 8.19	8.3.3.3	Section title (step name) revised, equations added to include "White Scatterer Identification"	
	8-24	8.4.1.1	Correction of Path Reflectance step overview	
	8-25	8.4.1.2	Clarification of MERIS Aerosol Model step overview	
	8-26	8.4.2	Additional <i>i</i> type variables	
	8-27	8.4.2	Correction of <i>s</i> type variable name Modification of <i>s</i> type variable	
	8-39	8.4.3.4.2	Additional <i>i</i> type variables	
	8-41	8.4.3.4.3	Modification of step 2.6.9.2-10	
	8-54	8.4.3.8.2	Correction of <i>s</i> type variable name	
	8-64	8.4.3.11.3	Correction of step 2.6.9.2.7-8	
	8-87	8.5.3.2	Modification Chl1 retrieval Algorithm description	
	8-88	8.5.3.3	Modification of an <i>s</i> type variable	
	8-89	8.5.3.3	Modification of an <i>s</i> type variable, addition of 2 <i>s</i> & 2 <i>c</i> type variables	
	8-92 & 8-93	8.5.5.2	Revision of step 2.9.7, including complete equation re-numbering	
	8-95 & 8-96	8.5.5.4.2	Modification of steps 2.6.11-6 to 2.6.11-11	
	8-96	8.5.5.4.2	Modification of steps 2.6.11-13	
	9-12	9.3.2	Modification of 4 <i>s</i> type variables	
	9-17	9.3.3.2	Modification of step 2.6.13-10	
	9-19	9.3.3.3	Modification of step 2.6.17.3-49	
	9-24	9.3.3.6.1	Additional <i>i</i> type variables	
	9-25	9.3.3.6.2	Modification of steps 2.6.17.3.3-14, 2.6.17.3.3-15 and 2.6.17.3.3-17	
	9-29	9.4.2	Modified <i>i</i> , and <i>s</i> type variables	
	9-29	9.4.3	Modification of test raising exception processing steps 2.8-1 and 2.8-2	
	9-30	9.4.3	Modification of step 2.8-5	
	10-4	10.4	Additional <i>i</i> type variable	
	10-14	10.5.9	Modification of step 2.10.10-1	
	10-17	10.5.13	Modification of the definitions of PCD_1_13 and PCD_15	
	10-18	10.5.13	Modification of the definitions of PCD_19, BLUE_AERO flag, LOW_PRESSURE flag	

# MERIS ESL

**Page** : 1-xv

7	2	30/06/05	Algorithm revisions from validation inputs	
	Page #	Section #	Comments	
	9-1	9.1	Name of aerosol products corrected	
	9-7	9.3.1.3	Mathematical description of step 2.6.17 updated	
	9-13	9.3.2	c type variables iaer2 and $\alpha_2$ removed	
	9-14	9.3.2	c type variables $\cos\Theta_{\text{scatt}}$ , $Px\omega_0$ , $Px\omega_{0,2}$ , C, and $\rho_a$ deleted Name and description of o type variable $\tau_a$ modified	
	9-19	9.3.3.3	Step 2.6.17.4 modified	
	10-5	10.4	description of i variable $\tau_{a865}$ modified, new i variable $\tau_{a442}$ added	
	10-6	10.4	name of s variables epsilon_scale and epsilon_offset changed to alpha_scale and alpha_offset. Descriptions updated	
	10-8	10.5.3	step 2.10.3-20b updated	
	10-9	10.5.3	step 2.10.3-34 updated	
	10-16	10.5.12	Step/section name updated Step logic and equations adapted to the land/water differences for the optical thickness product	
	10-18	10.5.13	Science Flag BLUE_AERO replaced by OADB, equation updated.	
	11-2	11	Applicability of breakpoints variables aer_mix, $f_a$ , $\omega_a$ , $\tau_a$ and $\rho_a$ restricted to water pixels	
	11-2	11	Applicability of breakpoints variables $SPM_{br}$ and $tp_w\_C2$ now linked to flag BPAC_ON instead of CASE2_S	
	11-2	11	Applicability of breakpoints variable BOAVI no more linked to the DDV_F flag	

	<b>MERIS</b>  <b>ESL</b>	<b>Doc</b> : PO-TN-MEL-GS-0006 <b>Name:</b> MERIS Level 2 Detailed Processing Model <b>Issue</b> : 8 <b>Rev</b> : 0B <b>Date</b> : 24 June 2011 <b>Page</b> : 1-xvi
---	--------------------------------	---

7	2A	30/10/06	Clarifications & corrections after IPF/prototype convergence	
	Page #	Section #	Comments	
	4-10	4.5.5	Clarification of the procedure <i>pressure_func</i>	
	6-6 & 6-7	6.5	Modification of the pixel selection criteria to switch between Land and Ocean Water Vapour algorithms	
	8-19	8.3.3.3	Correction of step 2.6.8-13	
	8-20	8.3.3.4.2	Use correct name for variable $\rho_w(b705)$ in step (2.6.10.2-10)	
	8-22	8.3.4 & 8.3.5	Update of sections Quality Control and Diagnostics and Exception Processing to align with Equations sections	
	8-34	8.4.3.3.3	Added missing step (2.6.9.1-5)	
	8-44	8.4.3.5.3	Corrected the bit number value applicable to PRE_BLUE	
	8-50	8.4.3.7.2	Corrected the definition of variables JDCurrMonth and JDNextMonth (from first days of current and next month to mid-month days)	
	8-54	8.4.3.8.2	Corrected the definition of variables JDCurrMonth and JDNextMonth (from first days of current and next month to mid-month days)	
	8-60	8.4.3.10.2	Wording: "Continental" replaced by "Blue"	
	9-11 & 9-19	9.3.2 & 9.3.3.3	Clarification on which wavelengths shall be used to compute the Angström exponent in step (2.6.17.3-46)	
	12-2	12	Chapter 12 corrected to be in-line with chapter 11.	

**Notes:**

- change bars left relative to issue 7.1.
- Unchanged sections left to issue 7.2.

8	0	15/07/09	Algorithm revisions from validation inputs	
	Page #	Section #	Comments	
	1-2	1.2	Figure 1.2-1 modified to reflect changes in Meris level 2 general control flow	
	1-3, 1-4	1.3	Table 1.3-1 "Algorithm step index, hierarchical order" updated	
	1-7, 1-9	1.3	Table 1.3-1 "Algorithm step index, numerical order" updated	
	3-3 & 3-4	3.4	Changes in i/o table due to saturation checks moved to section 3.5.2	
	3-6	3.5.2	Check saturation of TOA radiances, set flags	
	4-2	4.3.1	Mathematical description of Atmospheric Pressure Estimates modified	
	4-3	4.4	Changes in list of type <i>i</i> variables linked to change in general control flow: pressure estimates are now computed <b>after</b> pixel identification	
	4-3 to 4-4	4.4	New/modified <i>s</i> & <i>c</i> type variables linked to evolutions of Pressure algorithms	
	4-4	4.4	Changes in list of type <i>o</i> variables linked to changes in Pressure Estimates as well as in downstream algorithms	
	4-5	4.5	Introductory text modified	
	4-5	4.5.1	NN initialisation now includes Surface Pressure NN	
	4-5 to 4-7	4.5.2	Full section revised: step 2.1.12, Surface Pressure now estimated by a Neural Net	
	4-7, 4.8	4.5.3	Evolutions of Cloud Top Pressure algorithm	
	5-2	5.2	Flowchart of Pixel Identification modified	
	5-3	5.3	Cloud screening description modified	
	5-6 to 5-9	5.4	New type <i>i</i> and type <i>s</i> variables	
	5-9 to 5-10	5.4	New type <i>c</i> variables	
	5-11	5.4	New type <i>o</i> variables	
	5-12 to 5-14	5.5.1 & .2	Modifications in step 2.1.7 & 2.1.8	
	5-14	5.5.3	Clarification in Eq. 2.1.9-5	
	5-16, 5-17	5.5.3	Eq. 2.1.9-17, 2.1.9-19 & 2.1.9-21 deleted	
	5-17	5.5.4	Eq. 2.6.12.1-1 moved, existing unnumbered equations numbered, list of bands for average reflectance computation updated.	
	5-17, 5-18	5.5.4	Step 2.6.12.2 deeply modified	
	5-20	5.5.5	Glint reflectance estimation now done at every pixel	
	5-21	5.5.5	Systematic land/water re-classification over a priori land now subject to a condition on surface elevation	
	5-21, 5-22	5.5.5	Radiometric tests for land/water classification clarified	
	5-22 to 5-23	5.5.5	Step 2.1.6 modified for water pixels	
	5-28 to 5-29	5.5.9	Procedure Pscatt added	
	5-29 to 5-30	5.5.10	Procedure P1 added	
	5-30 to 5-31	5.5.11	Procedure compute_pressure added

**Page** : 1-xviii

	6-1, 6-2	6.2	Algorithm Overview reviewed including Fig. 6.2-1	
	6-3	6.3	Mathematical description reviewed to account for new Water Vapour algorithm over Land pixels	
	6-4, 6-5	6.4	List Of Variables reviewed to account for new Water Vapour algorithm over Land pixels	
	6-6	6.5	Neural Net initialisation added, computation of radiance from reflectance added, GoodPix condition revised	
	6-7	6.5.1	Condition modified for WV over Land or Cloud	
	6-7	6.5.2	Range checks for WV over Land or Cloud modified	
	6-7, 6-8	6.5.3	Full revision of step 2.3.1	
	6-8	6.5.4	Surface albedo computation introduced	
	6-9	6.5.6	Range checks for Land algorithm modified	
	6-10	6.5.7.2	Exception processing in function Water_Vapour_Polynomial improved	
	7-3	7.4	Lst Of Variables updated to account for algorithm evolutions	
	7-4	7.5	Eq. 2.4-1 added	
	8-3	8.2.1	Mention of processing on 4x4 sub-windows removed	
	8-4	8.2.1.4	Description of Vicarious Adjustment step added	
	8-7	8.2.2	List of variables updated	
	8-8 to 8-10	8.2.3	Processing on 4x4 sub-windows removed	
	8-9	8.2.3.1	SNOW_ICE_F flag combined to BRIGHT_F flag	
	8-10	8.2.3.5	Vicarious adjustment (step 2.6.5.5) added	
	8-35	8.4.2	Band 885 added to the set that are corrected for atmosphere, Note added on variables not used anymore but still required as breakpoints	
	8-35 to 8-38	8.4.2	List of Variables updated.	
	8.4.3.1.2	8-41, 8-42	Extension of applicable band set to 885	
	8.4.3.3.2	8-45	Extension of applicable band set to 885	
	8.4.3.3.3	8-46	Pressure correction moved to section 8.3.3.2	
	8.4.3.4.2	8-49, 8-50	Extension of applicable band set to 885	
	8.4.3.4.3	8-52	Extension of applicable band set to 885	
	8.4.3.6.2	8-59	Cosines replace angles as inputs variables for Sun and View zenith (List of Variables)	
	8.4.3.6.3	8-59	Cosines replace angles as inputs variables for Sun and View zenith (call to <i>spectral interpolation of <math>\zeta</math></i> )	
	8.4.3.7.2	8-62	New type <i>c</i> variables	
	8.4.3.7.3	8-63	Cosines replace angles as inputs variables for Sun and View zenith (call to <i>Aerosol parameters per band</i> )	
	8.4.3.7.3	8-64	Calls to <i>transmittance_up</i> and <i>transmittance_d</i> and <i>Denormaliser</i> modified according to new interfaces	
	8.4.3.11.2	8-75	Cosines replace angles as inputs variables for Sun and View zenith, extension of applicable band set to 885 (List of Variables)	

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-xix

8.4.3.11.3	8-76	Extension of applicable band set to 885, cosines replace angles as inputs variables for Sun and View zenith (call to <i>Aerosol parameters per band</i> ), comments added
8.4.3.12.2	8-78	Several changes in variables list
8.4.3.12.3	8-78	Several Eq. modified (setting of RWNEG, transmittance computations)
8.4.3.13.1	8-79	Cosines replace angles as inputs variables for Sun and View zenith (list of variables, call interface to routines)
8.4.3.13.2	8-80, 8-81	Cosines replace angles as inputs variables for Sun and View zenith (list of variables, interpolation in LUT)
8.4.3.13.3	8-82, 8-83	Cosines replace angles as inputs variables for Sun and View zenith (list of variables, interpolation in LUT)
8.4.3.13.4	8-84, 8-85	Cosines replace angles as inputs variables for Sun and View zenith (list of variables, call interface to routines)
8.4.3.13.5	8-86, 8-87	Fully revised routine
8.4.3.13.6	8-88	Updated interface, some steps removed (moved to call level)
8.4.3.4.13.7	8-89	Extension of applicable band set to 885
8.4.3.4.13.8	8-90	Extension of applicable band set to 885
8.4.3.13.10	8-93, 8-94	Fully revised routine
8.5.3.2	8-98	Parameter f0 introduced in description of bi-directionality correction
8.5.4	8-99	New variables added
8.5.5.2	8-104	Exception processing updated (Chl added), f0 computation added, use of irradiance reflectance (instead of bb_over_a) in reflectance ratio for Chl1 retrieval, range check on ratio added.
9-3	9.2.2	Size of several s type variables updated to follow algorithm changes, one new c type variable.
9-4	9.3.2.1	Computation of normalised and rectified reflectance extended to TOAVI_BRIGHT class.
9-5, 9-6	9.3.2.1	Rectification and normalisation parameters now class-dependent, some Eq. Numbers added, Exception processing upon negative TOAVI added.
9-6	9.3.2.2	Class dependence introduced in function <b>Normalize_F</b>
9-7	9.3.2.3	Identification of parameters set for function <b>Polynomial_ratio</b> clarified.
9-12, 9-15	9.3.2	Introduction of a flexible set of bands (2 or 3 among 4) for the Land Aerosol algorithm, several auxiliary data now provided at 4 bands instead of 3 previously.
9-18	9.3.3.3	Addition of step 2.6.17.0 to load and check the user defined set of bands
9-19, 9-20	9.3.3.3	Introduction of flexible band set in step 2.6.17.3, introduction of the <b>RefCorr</b> function.
9-20	9.3.3.3	New exception processing upon $\rho_G$ value
9-20	9.3.3.3	Modified call interface to <i>top_of_rayleigh_ref</i>

	<h1>MERIS</h1> <h1>ESL</h1>	<b>Doc</b> : PO-TN-MEL-GS-0006 <b>Name:</b> MERIS Level 2 Detailed Processing Model <b>Issue</b> : 8 <b>Rev</b> : 0B <b>Date</b> : 24 June 2011 <b>Page</b> : 1-xx
---	-----------------------------	--

	9-21	9.3.3.3	Modified computation of angstrom exponent to account for variable number of bands	
	9-22	9.3.3.3	Modified exception processing	
	9-25	9.3.3.6	Modified interface and Equations for <b>top_of_rayleigh_ref</b> : C_Corr being passed as an input its computation has been deleted.	
	9-28, 9-29	9.3.3.7	New procedure RefCorr	
	10-4, 10-5	10.4	New/modified/deleted inputs, modified c type variables	
	10-9	10.5.4	Quality indicators pc_low_pol_press and pc_low_NN_press replaced by pc_bad_surf_press and pc_bad_cloud_press respectively and restricted to their relevant surface class.	
	10-12	10.5.6	Steps 2.6.10 7, 2.6.10 7a and 2.6.10 7b deleted	
	10-18	10.5.13	Flag SNOW_ICE added for LAND_CLASS pixels, typo corrected, flag LOW_PRESSURE deleted	
	11-1 to 11-4	11	Several variables added, deleted or modified in breakpoints list	

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-xxi

8	0A	28/02/11	Algorithm revisions from validation inputs	
	Page #	Section #	Comments	
	2-1	2.2	New applicable and reference documents AD7 and RD11	
	2-3	2.4.2	Symbol b779 added to the list of bands as equivalent to b12 or b775, as closer to the actual wavelength (use of b775 should be avoided)	
	3-1	3.2	Flowchart of Pre-Processing step updated.	
	4-7	4.5.3	Equation (2.1.5-2b) corrected	
	5-8	5.4	Rayleigh reflectance LUT rhoR_LUT renamed as rhoRtab_LUT for consistency with other sections. A note is added regarding interpolation on cosines rather than angles.	
	5-9	5.4	Flag CloseToCoast f added to computed variables	
	5-10	5.4	iaer_sa(i,j) added to computed variables	
	5-11	5.4	rhoR1(b,j,f) added to output variables	
	5-13	5.5.1	Step 2.17-3 now applies to all bands but b900	
	5-14	5.5.1	Step 2.1.7-11 modified (calculation of BRIGHT_TOA_F)	
	5-14	5.5.1	Step 2.1.4-14: typo corrected	
	5-14, 5-15	5.5.1	Steps 2.1.7-20 and -21 added, step 2.1.7-17 to 2.1.7-19 corrected	
	5-15	5.5.1	Steps 2.6.26-14 to 2.6.26-19 moved from §5.5.5 to §5.5.1	
	5-15	5.5.2	Steps 2.1.8-0 added, 2.1.8-1 to -3 modified	
	5-16, 5-17	5.5.3	Typos in steps 2.1.9-10 & -14 corrected, steps 2.1.9-17, -21 & -22 added	
	5-18	5.5.4	Typo corrected in band loop limits for step 2.6.12.1-8	
	5-18, 5-19	5.5.4	index $\Delta\lambda_{b705}$ replaced by $i\lambda_{b705}$ for clarity steps (steps 2.1.3-2-b705 to 2.1.3-4-b705)	
	5-19	5.5.4	Use of band symbol b779 (instead of b775) generalised in steps 2.6.12.2-*	
	5-20	5.5.4	Steps 2.6.12.3-2-a <sub>h abv</sub> , -b <sub>h abv</sub> , -c <sub>h abv</sub> , & -d <sub>h abv</sub> corrected	
	5-21	5.5.5	Steps 2.6.26-14 to 2.6.26-19 have been moved at the end of section 5.5.1	
	5-22	5.5.5	Typo in 2.6.26-22 corrected	
	5-23	5.5.5	LUT rhoR_LUT renamed as rhoRtab_LUT for consistency with other sections. Interpolation on zenith angles <b>cosines</b> rather than angles (step 2.1.6-6)	
	5-28	5.5.9	Pscatt now takes rhoR1 as input for band 1 instead of (re)computing it internally: changes in input variables list and steps 2.1.7.1-3 & -4 deleted.	
	5-31	5.5.11	Exception processing added on step 2.1.7.3-1	
	5-31	5.5.11	Step 2.1.7.3-6 modified	
	6-4	6.4	List of variables revised.	
	6-7	6.5.1	step 2.6.5.1.9 transferred from §8.2.3 to §6.4	
	6-8	6.5.1	SNOW_ICE_F water pixels excluded from the Water algorithm scope	

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-xxii

	6-8	6.5.1	Typo corrected in 2.3.2-10 to -12	
	6-9	6.5.3	SNOW_ICE_F water pixels added to the Land algorithm scope	
	6-9	6.5.3	Steps 2.3.1-11, -13 & next exception processing modified	
	6-11	6.5.7.2	Exception processing modified	
	8-7	8.2.2	Variable $\rho$ deleted, $\rho_{ng}^*$ clarified, SNOW_ICE type corrected, $\tau_{R0}$ added	
	8-8	8.2.2	tau_atm and flag WV_HIGLINT deleted	
	8-8	8.2.3	Equations 2.6.12-1 & 2.6.12.1-10 renumbered 2.6.5-1 & 2.6.5-2 respectively.	
	8-9	8.2.3.1	Computation of tau_atm removed; Note about 4x4 sub-window removed	
	8-10	8.2.3.1	Step 2.6.5.1.9 move to section 6	
	8-12	8.3.1.2	Comment added about non-corrected glint pixels	
	8-14	8.3.2	Index of variable $\tau_{R0}$ corrected; ORINP0_F deleted	
	8-15	8.3.2	Typo in variable bs; additional breakpoint for $\rho_w$ _fe	
	8-16	8.3.2	Variable ang_exp moved and include dependence on bandset; annotation flag ANNOT_BPAC added	
	8-17	8.3.3.1	BPAC_ON flag initialised; Transfer BPAC flags to annotation	
	8-18	8.3.3.2	Use $\tau_{R0}$ variable in transmittance computation; initialise internal flags do_bandset, error and converge	
	8-20	8.3.3.2	Update exception processing	
	8-21	8.3.3.2	Update determination of bandset	
	8-23	8.3.3.3.1	Include bandset dependence in ang_exp	
	8-24	8.3.3.3.2	Activate BPAC_ON flag in case of success, and remove ACFAIL in case of failure	
	8-26	8.3.3.5	Add N_Fp_coeff and use it instead of N_Fp_ord; change computation of Fp, with a warning	
	8-27	8.3.3.6	$\rho_a$ type is only output	
	8-28, 8-29	8.3.3.7	Update initialisation and break on bb_old	
	8-30	8.3.4	Quality control and diagnostic has been totally revised with new ANNOT_BPAC flag. Note ORINP0 has been removed. Exception handling 1, 2 and 3 have been corrected.	
	8-31 to 8-33	8.4.1	Several typo corrections and clarifications about the use of tp_w_C2	
	8-34	8.4.2	Source step of variable $\rho_R$ changed	
	8-35	8.4.2	Range of tp_w_C2 extended to 885 nm	
	8-37	8.4.2	Range/Remarks on $\tau_a$ updated	
	8-40	8.4.3.1.2	Variables $\rho_{R0}$ and $\tau_{R0}$ updated as input	
	8-44	8.4.3.3.2	Variable $\rho_{R0}$ added	
	8-45	8.4.3.3.3	Text clarification about the reflectance over clear waters.	
	8-48	8.4.3.4.2	Variable $\tau_{R0}$ used instead of $\tau_{R a}$	
	8-60	8.4.3.7.2	idem	

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name:** MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 1-xxiii

	8-73	8.4.3.11.2	Variables ROGC and tpw_C2 added; breakpoint for $\rho_a$	
	8-74	8.4.3.11.3	Distinguish b775, b865 and b885 for $\rho_a$ computation	
	8-75	8.4.3.12.1	Loop on bands up to 885	
	8-76, 8-77	8.4.3.12.2	Add tpw_C2; change $\rho_w^*$ computation for bands 779, 865 and 885 nm but keep transmittance computation for all bands.	
	8-79, 8-81	8.4.3.13.2 8.4.3.13.3	XC coefficients are now indexed by m	
	8-80	8.4.3.13.2	Change the way $\tau_a$ is computed, by first interpolating XC coefficients	
	8-81, 8-82	8.4.3.13.3	Simplify $\zeta$ computation with XC coefficients interpolation	
	8-83	8.4.3.13.4	Correct a typo about $\tau_a$ in equation ( <i>apb-2</i> )	
	8-85	8.4.3.13.5	Use $\tau_{R0}$ instead of $\tau_{R\_a}$ ; Important clarification about warning 1 and warning 2	
	8-90	8.4.3.13.9	Add equality in positive testing of x1	
	8-92	8.4.3.13.10	Use $\tau_{R0}$ instead of $\tau_{R\_a}$ ; Important clarification about warning 1 and warning 2	
	8-95	8.5.2	Removal of the IMT algorithm	
	8-96	8.5.2	Update of the functional breakdown, without IMT alg.	
	8-97	8.5.3.4	Section deleted	
	8-98	8.5.4	Flag ICE_HIGHAERO added; range of $\tau_a$ and $f_0\_LUT$ updated;	
	8-99	8.5.4	Replace $bb\_over\_a$ by R (irradiance reflectance)	
	8-101	8.5.5	RWNEG condition replaced by positivity test; CASE2ANOM flag moved to other section	
	8-102	8.5.5.2	RWNEG condition replaced by positivity test	
	8-104	8.5.5.2	End of loop added	
	8-105	8.5.5.3	Change anomalous scattering condition	
	8-105	8.5.5.4	Section deleted	
	8-106	8.5.5.5	Typo corrected	
	8-107	8.5.6 and 8.5.7	Flags ORINP2 and OROUT2 removed	
	8-108 to 8-113	8.6	Completely new section, replaces 8.5.5.4	
	9-4	9.2.3.1	Symbols used for channels in measurement (15 channels) and auxiliary data (3 channels here) are now distinct.	
	9-7	9.2.3.3	Exception processing to step 2.2-19 clarified	
	9-12	9.3.2	New variables added (i & c), obsolete ones (i & c) removed, several renamed to remove obsolete 4x4 average subscript, additional breakpoints defined.	
	9-16 to 9-19	9.3.3.1	Loop on 4x4 sub-windows deleted for Rayleigh correction	
	9-16	9.3.3.1	Steps 2.6.23-2 to -5 and 2.6.15.1-3 to -5 deleted	
	9-17	9.3.3.1	Steps 2.6.15.4-1 to -4 deleted	

	<b>MERIS</b>  <b>ESL</b>	<b>Doc</b> : PO-TN-MEL-GS-0006 <b>Name:</b> MERIS Level 2 Detailed Processing Model <b>Issue</b> : 8 <b>Rev</b> : 0B <b>Date</b> : 24 June 2011 <b>Page</b> : 1-xxiv
---	--------------------------------	--

	9-17	9.3.3.2	Loop on 4x4 sub-windows clarified here as deleted above.	
	9-18	9.3.3.3	Band set definition moved out of the pixel loops	
	9-18, 9-19	9.3.3.3	Loop on 4x4 sub-windows and internal variables clarified locally.	
	9-20, 9-25, 9-26, 9-29	9.3.3.3, 9.3.3.6	Variable $\rho_G$ renamed $\rho_{\text{Ground}}$ and $\rho_R$ renamed $\rho_{RI}$ for consistency and to avoid confusion other DPM sections.	
	9-20	9.3.3.3	Wavelength to be used in 2.6.17.3-7 changed to theoretical	
	9-20	9.3.3.3	Repeat loop break condition 2.6.17.3-25 modified	
	9-21	9.3.3.3	Additional Exception Processing after step 2.6.17.3-45	
	9-21	9.3.3.3	Step 2.6.17.3-53 clarified	
	9-21	9.3.3.3	Step 2.6.17.3-47 clarified	
	9-21	9.3.3.3	Step 2.6.17.4-1 split into -1a & -1b and clarified	
	10-2	10.3.1.2.3	Definition of 2 fields of the Summary Product Quality ADSR updated	
	10-4	10.4	Obsolete input variables deleted, new ones added.	
	10-17	10.5.13	Obsolete symbol b890 replaced by b885	
	10-17	10.5.13	Definition of PCD_17 (Land & Water) & PCD_18 (Land) modified	
	10-18	10.5.13	Definition of Science flags OADB and ABSOA_DUST clarified	

**Note:**

- change bars left relative to issue 7.2A.

8	0B	24/06/11	Clarifications after convergence with IPF	
	Page #	Section #	Comments	
	4-5	4.5.1	Step 2.1.12-1 clarified: fSL indexed by Detector(j,f)	
	4-7	4.5.3	Step 2.1.5-2a clarified: fSL indexed by Detector(j,f)	
	5-6	5.4	Sun azimuth angles added to inputs in list of variables.	
	5-10	5.4	Description of $\cos\theta_{\text{scat}}$ variable clarified	
	5-10	5.4	Variable $\cos\theta_{\text{scat}}$ 4x4 added	
	5-13	5.5.1	Spectral domain of step 2.1.7-2 extended up to b900	
	5-14	5.5.1	Step 2.1.7-22 added (from previous step 2.1.9-8, deleted)	
	5-14	5.5.1	SATURATED_F flag explicitly added to P1 function interface	
	5-14	5.5.1	Equation 2.1.7-20 corrected	
	5-15	5.5.1	Equation 2.1.8-1 corrected	
	5-16	5.5.3	Equation 2.1.9-8 deleted (moved up as 2.1.7-22)	
	5-23	5.5.5	Step 2.1.6-9 clarified	
	5-28	5.5.9	Variable $\Delta\phi$ added to list of inputs of function Pscatt	
	5-29	5.5.9	Equation 2.1.7.1-12 clarified	
	6-7	6.5	Typo corrected in equation 2.6.5.1.9-1 & -2 (indexing)	
	7-4	7.4	Variable $L_T$ added to c types list.	
	8-7	8.2.2	$\tau_R(b)$ removed from list of variables	
	8-21	8.3.3.2	Font problem corrected in equation 2.6.8.5-5	
	8-24	8.3.3.3.2	Font problem corrected in condition above equation 2.6.8.7-7a	
	8-28	8.3.3.7.2	typo corrected in exception condition above equation rtbb-1	
	8-50	8.4.3.4.2	taua(b) removed from list of variables	
	8-50	8.4.3.4.3	Extension of step 2.6.9.2-15 to 885 removed.	
	8-52	8.4.3.5.2	Domain of variable UseA clarified	
	8-56	8.4.3.6.2	Domain of variable UseA clarified	
	8-61	8.4.3.7.3	Calls to transmittance_up and transmittance_d clarified	
	8-66	8.4.3.9.2	Domain of variable $\tau_a$ 865 clarified	
	8-67	8.4.3.9.3	Indexing of variable $\tau_a$ 865 clarified (in 2.6.9.2.5-7 & -8)	
	8-72	8.4.3.11.2	Domain of variable $\tau_a$ 865 clarified	
	8-72	8.4.3.11.2	Spectral domain of variable pa clarified	
	8-73	8.4.3.11.3	Indexing of variable $\tau_a$ 865 clarified (in 2.6.9.2.7-1 & -3)	
	8-75	8.4.3.12.2	Variables ia1 & ia2 added to replace ia_candidate	
	8-75	8.4.3.12.2	Variable $\tau_a$ 865 added to replace $\tau_a$ candidate	
	8-76	8.4.3.12.3	Calls to transmittance_up and transmittance_d clarified	
	8-77	8.4.3.13.1	Function interface clarified	
	8-82	8.4.3.13.4	Function interface clarified	
	8-82	8.4.3.13.4.1	Domain of variable $\tau_a$ 865 clarified	
	8-82	8.4.3.13.4.2	Steps apb-0a & apb0b added to clarify aerosol indexing	
	8-82 & -83	8.4.3.13.4.2	Indexing of variable $\tau_a$ 865 & $\tau_a$ _vis clarified (in apb-1 to -3)	

	<b>MERIS</b>  <b>ESL</b>	<b>Doc</b> : PO-TN-MEL-GS-0006 <b>Name:</b> MERIS Level 2 Detailed Processing Model <b>Issue</b> : 8 <b>Rev</b> : 0B <b>Date</b> : 24 June 2011 <b>Page</b> : 1-xxvi
---	--------------------------------	--

	8-84	8.4.3.13.5	Function interface clarified	
	8-84	8.4.3.13.5.1	Variables ia1 & ia2 added to replace ia_candidate	
	8-84	8.4.3.13.5.2	Indexing of LUT tup_LUT clarified (in tup-1 & -2)	
	8-91	8.4.3.13.10	Function interface clarified	
	8-84	8.4.3.13.10.1	Variables ia1 & ia2 added to replace ia_candidate	
	8-84	8.4.3.13.10.2	Indexing of LUT t <sub>down</sub> _LUT clarified (in td-1 & -2)	
	9-14	9.3.2	Added index b and list of bands to variable C_Corr	
	9-19, 9-20	9.3.3.3	Added index b to variable C_Corr in steps 2.6.17.3-51, .2.6.17.3-49, .2.6.17.3-50	
	9-20	9.3.3.3	Range clipping to $\geq 1e-6$ added in exception processing below step .2.6.17.3-45	
	9-21	9.3.3.3	Font problem corrected in equation 2.6.17.3-47

## 1. - Introduction

### 1.1 - General

This document is the Detailed Processing Model document for the MERIS data processing. It covers the MERIS Level 2 processing, as defined in "MERIS System Architecture Theoretical Basis Document", PO-TN-MEL-GS-0001 (RD9).

### 1.2 - Purpose and Scope

This document provides a detailed description of the MERIS processing algorithms in terms of algorithms and data structures, following the guidelines in AD1. This detailed description is intended to serve as :

- a functional requirements specification for the MERIS data processing entities within the ENVISAT-1 ground segment;
- a basis for the estimate of the computation resources requirements for the MERIS data processing.

This document describes in detail data processing to be applied to the MERIS pixels, in order to derive **the MERIS level 2 Reference Products**, in Reduced Resolution as well as in Full Resolution. It provides detailed descriptions of the algorithms and parameters in the MERIS level 2 processing architecture.

The Level 2 processing is in charge of processing TOA radiance measurements into geophysical parameters. These parameters depend on the observed pixel (water, land, cloud) and provide information on:

- the surface properties : normalised reflectance at surface, chlorophyll and other water constituents concentration (ocean); reflectance at surface, vegetation indices (land);
- the properties of the atmosphere above the surface : aerosol type and optical thickness, water-vapour column content, cloud top height, optical thickness and albedo.

The general structure of Level 2 processing and products is presented in the following flow chart (figure 1.2-1) The box numbers refer to the different step numbers of the MERIS Level 2 processing breakdown presented in RD9. Note that, in the diagram below, the paths labelled in **Arial** type indicate the main control flow, according to pixel type; those labelled in *Times italic* indicate the product flow.

## 1.3 - Guide to this document

This document is organised as follows:

- **Section 2** lists the applicable and reference documents, abbreviations, notations and conventions.  
Section 2.4, notations and conventions, is essential reading and reference for this specification.
- **Sections 3 to 10** provide the detailed specification of the MERIS level 2 processing. Level 2 processing is hierarchically broken down into algorithm steps. The top level breakdown is shown in fig. 1.2-1 above. The following tables 1.3-1 and 1.3-2 provide the correspondence between step number and the section number for detailed specification, respectively in hierarchical order and in numerical order.
- **Section 11** lists all breakpoints to be made available in testing and diagnostic.
- **Section 12** specifies the extraction of the low resolution Level 2 product from the Reference product.
- **Annex A**, the Parameters data list, provides the correspondence between algorithm auxiliary parameters (specified parameters, symbol "s" in column T of "List of variables" tables) and the databases specified by the Input /Output Definition Document (AD4).

TOA	Top Of Atmosphere
TSM	Total Suspended Matter (equivalent to SPM)

## 2.4 - Notations and Conventions

### 2.4.1- Look-Up Tables

The term Look-Up Table (LUT) is used within this document in the wide acceptance of a table with multiple index variables, pre-computed and loaded into the MERIS processor from a file. LUTs as a rule correspond to data sets identified in the I/O DD (AD4).

### 2.4.2 - Table indexing and Spectral Bands

The subscripts of the array data structures shall be

b band (see below); j column ( $j \in \{1..J\}$ ); f frame ( $f \in \{1..F\}$ );

In general spectral bands shall be indexed by variable b.  $\lambda(b)$  denotes the wavelength for band **b**, with :

Number	Symbols	$\lambda(b)$ in nm	$\Delta\lambda(b)$ in nm
1	b1 or b412	412.5	10
2	b2 or b442	442.5	10
3	b3 or b490	490.0	10
4	b4 or b510	510.0	10
5	b5 or b560	560.0	10
6	b6 or b620	620.0	10
7	b7 or b665	665.0	10
8	b8 or b681	681.25	7.5
9	b9 or b705	708.75	10
10	b10 or b753	753.75	7.5
11	b11 or b761	760.625	3.75
12	b12 or b775 or b779	778.75	15
13	b13 or b865	865.0	20
14	b14 or b885	885.0	10
15	b15 or b900	900.0	10

Table 2.4-1 : Band wavelength correspondence

Symbol notations found in this document for band index are b, b1..b15 (indices of bands 1 to 15), b412..b900 (indices of bands whose central wavelength is 412nm..900nm).

### 2.4.3 - Table Interpolation

Interpolation in look-up tables shall be noted :

$\langle result \rangle = \langle table \rangle$  [**interp**: ( $\langle linear interpolation indices \rangle$ )] [**nearest**: ( $\langle nearest neighbour interpolation indices \rangle$ )] **select**: ( $\langle indices \rangle$ )

Example : let T\_LUT be a table indexed by ( u , v ,  $\beta_k$  ,  $\gamma_k$ ).

$\alpha = T\_LUT$  **interp**: (u , v) **select**: ( $\beta_k$  ,  $\gamma_k$ ) denotes that a linear interpolation has been performed to obtain  $\alpha$  as a function of (u,v) on the selection of T\_LUT corresponding to indices  $\beta_k$  and  $\gamma_k$ .

	<b>MERIS</b>  <b>ESL</b>	<b>Doc</b> : PO-TN-MEL-GS-0006 <b>Name:</b> MERIS Level 2 Detailed Processing Model <b>Issue</b> : 8 <b>Rev</b> : 0B <b>Date</b> : 24 June 2011 <b>Page</b> : 2-4
---	--------------------------------	---

$\alpha = T\_LUT$  **nearest:** (u , v) **select:** ( $\beta_k$  ,  $\gamma_k$ ) denotes that a selection has been performed to obtain  $\alpha$ , at indices nearest to (u,v) and matching exactly  $\beta_k$  and  $\gamma_k$ .

#### IMPORTANT NOTES

1. Exception processing: when any of the index parameters is out of the corresponding index range, the value of the index parameter shall be replaced by the nearest value in the index range.

Example: if T\_LUT is indexed by (a, b) and the index range for a is  $a_{min}..a_{max}$ , then

if (a <=  $a_{min}$ ) T\_LUT **interpol:**(a, b) = T\_LUT **interpol:**( $a_{min}$ , b)

if (a >=  $a_{max}$ ) T\_LUT **interpol:**(a, b) = T\_LUT **interpol:**( $a_{max}$ , b)

Flagging of such out-of-index-range condition shall be performed only when explicitly specified.

2. In some cases, interpolation may be specified on indices which need transformation of the original LUT grid vector provided in the auxiliary data files: e.g. a vector of angles is provided to describe one of the LUT dimension while interpolation is required on the angle cosine. To keep the present document as independent as possible from AD4, these simple transformations will not be described explicitly and the responsibility of establishing correspondence, and transformation if required, between AD4 grid vectors and interpolation parameters specified hereafter is left to the user.

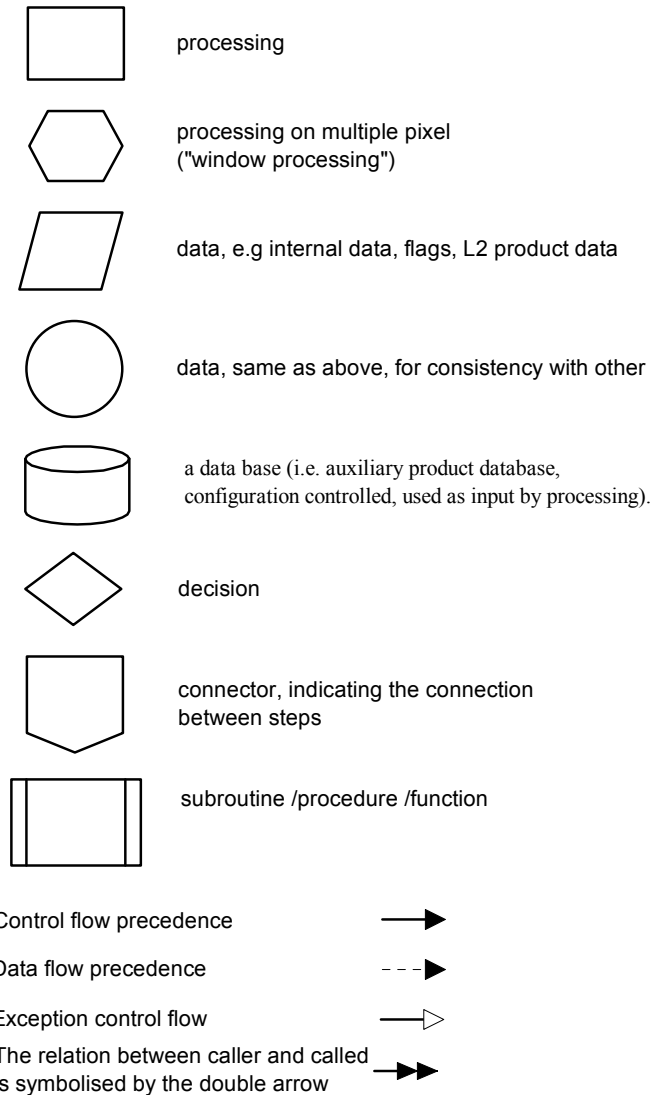

#### 2.4.4 - Parameter type

The column labelled "T" (for Type) in the lists of variables in each algorithm description section below describes the type of the variable :

- i input to the algorithm step (from a previous step)
- c intermediate result
- s specified in Look Up Tables (LUTs) - The correspondence between such parameters and the auxiliary databases specified in AD4 is defined in Appendix A: Parameters Data List. Also includes implementation-dependent constants (not found in AD4).
- o output of the algorithm step

#### 2.4.5 - Block diagram symbols

In all functional block diagrams the symbols in table 2.4.5-I below are used.

*Table 2.4.5-1 : Diagram symbols*

## 2.4.6 - Units

Table 2.4.6-1 below describes the units used in this document, shown in column "U" in the lists of variables :

	<b>MERIS</b>  <b>ESL</b>	<b>Doc</b> : PO-TN-MEL-GS-0006 <b>Name:</b> MERIS Level 2 Detailed Processing Model <b>Issue</b> : 8 <b>Rev</b> : 0B <b>Date</b> : 24 June 2011 <b>Page</b> : 2-6
---	--------------------------------	---

Unit symbol	Name
dl	dimensionless
EU or $W.m^{-2}.\mu m^{-1}$	spectral irradiance
LU or $W.m^{-2}.sr^{-1}.\mu m^{-1}$	spectral radiance
s	seconds
%	percentage
K	degree Kelvin (temperature)
° or deg	degree (angle)
rad	radian
hPa	hectoPascal
DU	Dobson Unit (= $10^{-3}$ atm.cm)
IU or $W.m^{-2}$	irradiance
$\mu einstein.m^{-2}.s^{-1}$	micro Einstein (= $10^{-6}$ mol.photon) per square metre per second (unit for PAR)

*Table 2.4.6-1 - Units and notation*

#### 2.4.7 - Parameter coding

For all flag (boolean) fields, the flag is considered to be TRUE when it is set to 1, and it is considered to be FALSE when it is set to 0.

The value BAD\_VALUE is a convention value meant to represent the output when an algorithm fails. Its choice is left to implementation but should fulfil the following constraints:

1. BAD\_VALUE must be meaningfully outside the validity range of any parameter in MERIS processing;
2. the IEEE floating-point representation of BAD\_VALUE must be exact so as to permit equality ( == or != ) comparisons;

The value BAD\_PRODUCT is a code written to the MERIS L2 product MDS to indicate an invalid parameter. Following the convention in AD5, BAD\_PRODUCT shall be 0.

#### 2.4.8 - Geometry auxiliary parameters

The geometry (latitude, longitude,  $\theta_s$ ,  $\theta_v$ ,  $\Delta\phi$ , ... ) and the meteorological data (wind speed, pressure , ... ) are not given for all pixels, they are given at tie points or at grid points of the ECMWF grid. Therefore, interpolations will have to be performed when needed. In this case, the notation will remain unchanged, e.g.  $\theta_s(j,f)$  is the viewing zenith angle interpolated from the viewing zenith angles of the surrounding tie points). When interpolation is not needed and the value of the closest tie point is sufficient, the variable name will be given a "\_tie" extension, e.g.  $\theta_s\_tie(i,j)$  ,  $\theta_v\_tie(i,j)$  ,  $lat\_tie(i,j)$  ,  $long\_tie(i,j)$  , ....

#### 2.4.9 - Pseudo-code

In the sections where pseudo-code is needed, all text in *italic type* has to be considered as comments. So does text enclosed between C-style comment delimiters `/* */`.

#### 2.4.10 - Requirements numbering

Statements or equations to be considered as requirements for L2 processing implementation will be followed by a unique number composed of step number, followed by a requirement number within the step, between parentheses.

#### IMPORTANT NOTE

For the sake of backward compatibility with earlier versions of the DPM and processor code, statement numbers DO NOT follow a logical sequence. The sequence of document chapters is not representative of control flow: for control flow, refer to the block diagrams. Within a given DPM section, the sequence of statements is representative of control flow..

#### 2.4.11- Standard mathematical functions

Mathematical functions used in this document, assumed to be provided by the standard libraries applicable to the MERIS processor, will be noted in **bold type**. Table 2.4.11-1 below provides a summary of the functions used.

<b>Symbol</b>	<b>Name</b>
<b>arc cos</b>	arc cosine in degrees
<b>arc sin</b>	arc sine in degrees
<b>arc tan</b>	arc tangent in degrees
<b>cos</b>	cosine of an angle in degrees
<b>exp</b>	exponential
<b>floor</b>	largest integer smaller than a number
<b>int</b>	nearest integer to a number
<b>ln</b>	Neperian logarithm
<b>log</b>	Neperian logarithm
<b>log<sub>10</sub></b>	Decimal logarithm
<b>MAX</b>	largest element of a list
<b>MIN</b>	smallest element of a list
<b>sin</b>	sine of an angle
<b>tan</b>	tangent of an angle

*Table 2.4.11-1: Standard mathematical functions*

#### 2.4.12 - Illumination and observation geometry convention

The following illumination and observation geometry conventions are used in MERIS processing :

	<b>MERIS</b>  <b>ESL</b>	<b>Doc</b> : PO-TN-MEL-GS-0006 <b>Name:</b> MERIS Level 2 Detailed Processing Model <b>Issue</b> : 8 <b>Rev</b> : 0B <b>Date</b> : 24 June 2011 <b>Page</b> : 2-8
---	--------------------------------	---

- A point on Earth observed by MERIS is taken as a reference
- The sun zenith angle  $\theta_s$  is the angle between the local outward normal and the vector from the point towards the Sun.
- The view zenith angle  $\theta_v$  is the angle between the local outward normal and the vector towards the MERIS sensor.
- The azimuth difference  $\Delta\phi$  is the angle between the half-plane containing the local normal and the Sun, and the half-plane containing the local normal and MERIS. In the principal plane,
  - there may be *specular reflection* of a point source into the MERIS sensor when the azimuth difference is **180°** (and the zenith angles are equal)
  - there may be *back-scatter* from a point source into the MERIS sensor when the azimuth difference is **0°** (and the zenith angles are equal).

In general, we assume that an azimuth difference of N degrees is equivalent wrt. MERIS radiometry, to  $360^\circ - N$ , so that the  $\Delta\phi$  ranges from  $0^\circ$  to  $180^\circ$ .

#### IMPORTANT NOTE

All Look-up tables used by the processor assume the above convention for indexing. Should a radiative transfer tool used to compute these tables follow a different convention, it is essential that reordering of the values in order to respect the above convention should be performed **before** integration of the table into the MERIS processor.

### 2.4.13 - Exception handling

This Document combines two ways of specifying exception processing:

1. in line with algorithm specification, blocks of statements labelled as follows:

exception processing: <condition>:

<actions>

end of exception processing

Such blocks may refer explicitly to the statement(s) where the exception can occur, or they refer to the statement immediately above.

2. common exception handling routines in a section "Exception processing" for a given algorithm step, which may be referred from several places in the algorithm.

### 2.5- List of TBDs

This document does not contain any TBD.

### 3.- MERIS pre-processing

#### 3.1 - Introduction

This section describes:

- the checks to be applied to the Level 1b product submitted to processing to ensure that the data it contains respect the processing constraints
- data extraction
- preliminary processing to be applied to Annotation Data Sets: interpolation of annotations from the tie-points grid to the pixel grid
- preliminary processing to be applied to Measurement Data Sets: radiance to reflectance conversion.

#### 3.2 - Algorithm Overview

The MERIS level 2 pre-processing is applied to each pixel and follows the logic shown in the flow chart in figure 3.2-1.

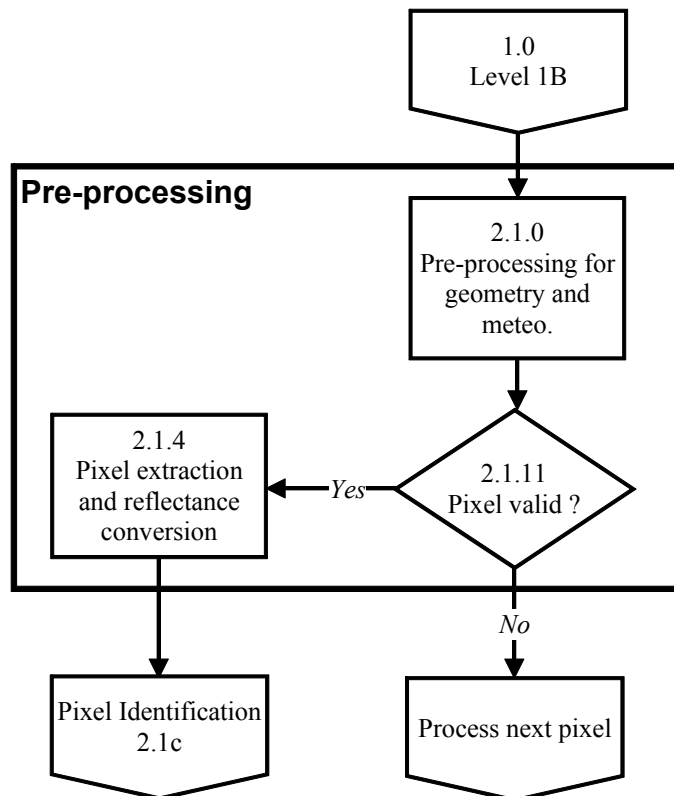

Figure 3.2-1 : MERIS level 2 pre-processing (step 2.1a)

**Date** : 24 June 2011  
**Page** : 3-2

## 3.3 - Mathematical Description Of Algorithm

### 3.3.1 - Level 1b product check

If one or more band within the Level 1b product is not one of those in table 2-1, the product shall not be processed to Level 2.

If the Solar irradiance in the Level 1B product (GADS scaling factors) is 0 in any band, the product shall not be processed to Level 2.

### 3.3.2 - Pre processing step

#### 3.3.2.1 - Pre-processing for geometry and meteorological parameters (step 2.1.0)

This step is done in order to derive geometry and meteorological parameters (pressure, wind) at each pixel, including invalid ones, from those provided at each tie point of the Level 1b annotation product.

#### 3.3.2.2 - Level 1b pixel classification screening (step 2.1.11)

The Level 2 pixel identification starts with the reading of the INVALID flag of the Level 1b product. If it is set to TRUE, then no further processing of the current pixel is done, the L2 product shall contain fixed values for all MDS (see section 10 below), with the "Invalid" flag set, and the next pixel is examined ; otherwise, the processing of the current pixel is pursued.

#### 3.3.2.3 - Pixel extraction and reflectance conversion (step 2.1.4)

If the Level 1b pixel is not flagged INVALID, the other L1B flags and the Top Of Atmosphere radiances at all bands are extracted from the L1B product. Radiances are converted to reflectances, using the Sun zenith angle cosine interpolated at the pixel and the Sun spectral flux read from the L1B product annotations.

### 3.4 - List of Variables

Note: in this section and section 3.5 below, J and F are the notation for the index of column and frame corresponding to tie points, j and f are (as in the rest of this DPM) the product column and frame indices.

Variable	Descriptive Name	T	U	Range - References
INVALID_F(j,f)	Invalid flag	i /o	dl	from Level1b (Flags MDS), to Breakpoint
LAND_F(j,f)	Land flag (TRUE when land, FALSE when ocean)	i /o	dl	from Level1b (Flags MDS), to Breakpoint
TOAR(b,j,f)	TOA Radiance	i	LU	all bands; from level 1b MDS
Detector(j,f)	MERIS detector associated to pixel	i	dl	from Level1b (Flags MDS)
JD1, JD2	UTC times of first and last frames in product	i	jd	from Level1b (Flags MDS)
$\theta_s(J,F)$	Sun zenith angle at tie point	i	deg	from Level 1b (LADS)
$\theta_v(J,F)$	Viewing zenith angle at tie point	i	deg	from Level 1b (LADS)
$\phi_s(J,F)$	Azimuth of sun angle at tie point	i	deg	from Level 1b (LADS)
$\phi_v(J,F)$	Azimuth of view angle at tie point	i	deg	from Level 1b (LADS)
lat(J,F)	Latitude at tie points	i	deg	from Level 1b (LADS)
lon(J,F)	Longitude at tie points	i	deg	from Level 1b (LADS)
z(J,F)	Altitude at tie points	i	m	from Level 1b (LADS)
W_u(J,F), W_v(J,F)	Wind vector components at tie points	i	m.s <sup>-1</sup>	from Level 1b (LADS)
U <sub>O3</sub> (J,F)	Actual ozone content at tie points	i	DU	from Level 1b(LADS)
P <sub>Sea_ECMWF</sub> (J,F)	ECMWF mean sea level pressure at tie points	i	hPa	from Level1b (LADS)
H <sub>p</sub>	Pressure scale height	s	m	From data base
Dsun <sub>0</sub> <sup>2</sup>	Square of Sun-Earth distance at reference date	s	m	From data base
F <sub>0</sub> <sup>RR</sup> (b,k)	Extra-terrestrial Sun irradiance at reference date for all MERIS RR detectors and band	s	EU	From data base
F <sub>0</sub> <sup>FR</sup> (b,k)	Extra-terrestrial Sun irradiance at reference date for all MERIS FR detectors and band	s	EU	From data base
SATURATION_L(b)	Default radiance for saturated pixels	s	LU	All bands
p, q	linear interpolation weights for ancillary data	c	dl	
$\phi_v(j, f)$	View azimuth angle at (j, f)	c	deg	
P <sub>Sea_ECMWF</sub> (j,f)	ECMWF mean sea level pressure interpolated at pixel (j,f)	c	hPa	
sun_pos	Sun centre location in Geocentric reference frame at mid-product date	c	m	Mission CFI output
seasonal_fact	Correction factor for seasonal variation of Sun irradiance	c	dl

**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 4-2

## 4.3 - Mathematical Description Of Algorithm

### 4.3.1 - Atmospheric pressure estimate (steps 2.1.5, 2.1.12)

The pressure is estimated over Land and Cloud pixels from the MERIS bands 10: 753.75 nm and 11: 760.625 nm, using dedicated Neural Net (NN) algorithms.

The basic inputs of both Neural Nets are:

- The transmittance of molecular oxygen at 761 nm, estimated from bands 11 – with absorption – and a non-absorbing reference: band 10 over clouds or a combination of bands 10 & 12 over land.
- The wavelength of band 11 at every pixel is an input of the neural nets.
- The signal in band 10 (either in radiance – CTP – or normalised radiance –  $P_S$ )
- The illumination and observation geometry.
- The "cloud top pressure" NN also uses a priori knowledge of the surface albedo, where appropriate.
- The "surface pressure" NN also uses an a priori knowledge of the aerosol optical thickness.

To retrieve the Cloud Top Pressure,  $P_{top}$ , a neural net (NN) approach is used. The algorithm is detailed in RD 8, 2.3. The MERIS signals in channel 10, 11, the surface albedo  $\alpha_{surf}$  and the geometry (sun zenith angle, viewing zenith angle and azimuth angle) are used as input of the Neural Network. The net produces the cloud Top pressure  $P_{top}$ . Depending on the surface albedo two different neural nets are used (one for surface albedo equal to zero, one for non-zero surface albedo). Neural Nets are selected according to spectral shift index.

The Neural Nets apply generic Neural Net functions, as specified in AD6, to specific auxiliary parameters and inputs, to obtain the required outputs. All specific aspects of the application are described in section 4.5 below.

Each pressure estimate produces Product Confidence Data (PCD).

**NOTE:**

1. all calculated and output Boolean parameters shall be initialised to FALSE (0).
2. subscript FR or RR for type s variable  $\lambda_{\text{pix}}$  is omitted in equation section below. Proper variable shall be selected according to processed product resolution.

#### 4.5 – Equations (step 2.1b)

*Surface Pressure and Cloud Top Pressure processing uses two Neural Network structures to derive Pressure from TOA radiances at bands b753, b761, wavelength of band 11, viewing and illumination geometry, surface albedo or aerosol optical thickness. The Neural Network structures must be created at process initialisation by decoding tables in NNff format (see AD6), read from the auxiliary parameters data files. They are then activated in turn for each relevant pixel.*

##### 4.5.1 - Neural Networks Initialisation (steps 2.1.5.0, 2.1.12.0)

*At process initialisation*

read GADS- Cloud Neural network for non-zero albedo into memory (see AD6) (2.1.5.0-1)

**call** NN\_CreateNetFromMemFile routine (see AD6) (2.1.5.0-2)

input: address of memory copy of GADS

return value: CTP\_Albedo\_Net

read GADS- Cloud Neural network for null albedo into memory (see AD6) (2.1.5.0-3)

**call** NN\_CreateNetFromMemFile routine (see AD6) (2.1.5.0-4)

input: address of memory copy of GADS

return value: CTP\_NoAlbedo\_Net

read GADS- Surface Pressure Neural network into memory (see AD6) (2.1.12.0-1)

**call** NN\_CreateNetFromMemFile routine (see AD6) (2.1.12.0-2)

input: address of memory copy of GADS

return value: SurfP\_Albedo\_Net

*end of process initialisation section*

#### **Product processing :**

**For each VALID pixel (in column j, frame f):**

*Deleted (step 2.1.3)*

*compute reflectance ratio*

**If** (  $\rho(b753, j, f) > 0$  ) **and not** SATURATED\_F(b753,j,f)  
**and not** SATURATED\_F(b761,j,f) **then**

## 5. - MERIS pixel identification

### 5.1 - Introduction

Before pursuing the processing of the pixels towards **Cloud, Land or Water processing**, or to **exempt them from further processing**, it is necessary to screen sort into four categories:

- cloud,
- land,
- water,
- invalid

This chapter describes the processing to be applied to the MERIS pixels in order to achieve this classification (see RD8, §2.17), starting from the level 1b geo-location based land/water *a priori* classification:

- Cloud pixels identification
- Stratospheric aerosol correction, when applicable, i.e. in the periods following a massive release of particles into the stratosphere, such as may occur after volcanic eruptions.
- Corrections of reflectance for absorption by ozone, molecular oxygen and water vapour.
- Consolidation, using radiometry, of the land/water *a priori* classification of non cloudy pixels for which *a priori* surface classification has low confidence (because of geo-location uncertainty, high tide zones, seasonal variations of water level...).

### 5.2 - Algorithm Overview

The MERIS level 2 pixel identification is applied to each pixel and follows the logic shown in the flow chart in figure 5.2-1.

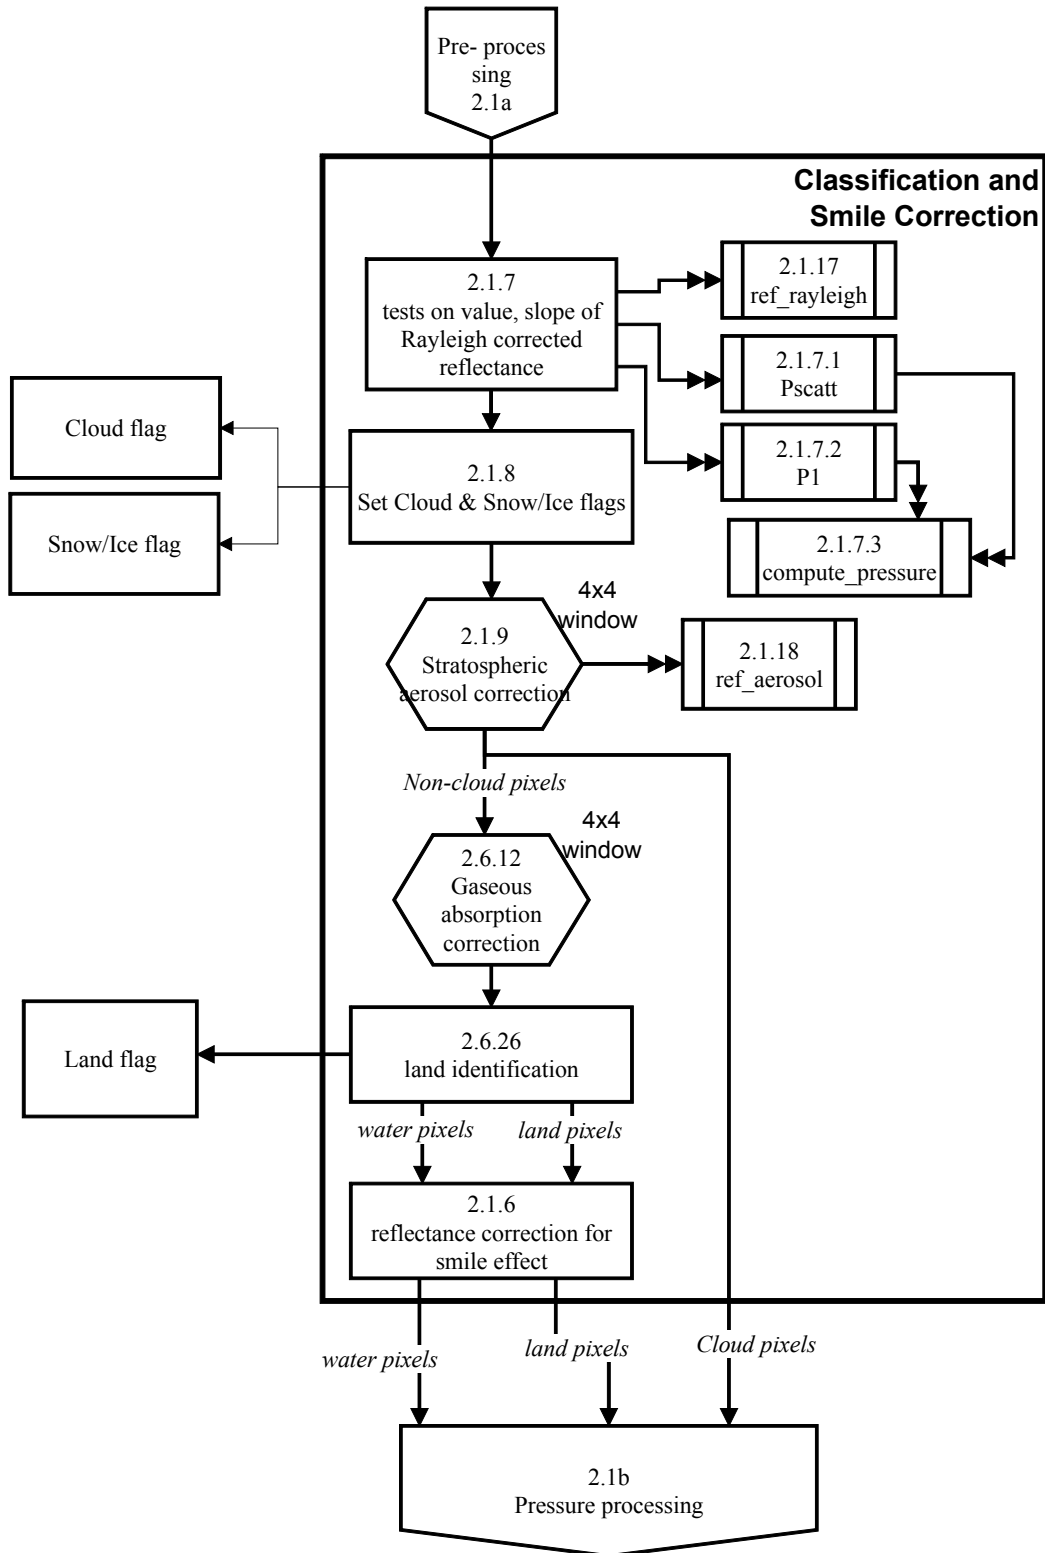

Figure 5.2-1 : MERIS level 2 pixel classification (step 2.1c)

## 5.3 - Mathematical Description Of Algorithm

### 5.3.1 - Cloud screening (steps 2.1.2, 2.1.7, 2.1.8)

The algorithm to screen clouds from other surfaces is described in RD8, section 2.17.

As clouds are often bright, a first stage screening is done for the determination of bright pixels using tests and auxiliary data values depending on a priori knowledge classification of the surface among Land and Water. Apparent pressure is also computed using specific procedures over Land and Water to allow detection of high altitude thin clouds not captured by the bright tests.

Those two tests, plus additional tests on the spectral slope of the Rayleigh corrected reflectance over Land, aiming at discarding sand and snow/ice, are used to derive a Cloud mask, as well as a Snow/Ice flag applicable to non-cloudy pixels.

### 5.3.2- Stratospheric Aerosol Correction (step 2.1.9)

When the switch to perform stratospheric aerosol corrections is set, all valid pixels are corrected for stratospheric aerosol transmission and scattering. Correction applies to all TOA reflectance bands.

The correction algorithm is similar to the one described in section 9.3.3 below; the stratospheric aerosol parameters are read from auxiliary parameters sets. The algorithm runs on a 4x4 pixels window.

### 5.3.3 - Gaseous absorption corrections (step 2.6.12)

Gaseous correction processing is organised in three steps, O<sub>3</sub>, O<sub>2</sub> and H<sub>2</sub>O correction. Input is the TOA reflectance for the MERIS channels, corrected for stratospheric aerosols when applicable:  $\rho(b, j, f)$ . Its output is the reflectance corrected for gaseous absorption ( $\rho_{ng}$ ). All three algorithms apply polynomial expressions using LUT technique. In step 2.6.12.1 the O<sub>3</sub> transmittance is estimated over a 4\*4 pixel window\*. In step 2.6.12.2 and 2.6.12.3 the O<sub>2</sub> and H<sub>2</sub>O transmittances are estimated for each land pixel. Because the signals used are weak, an average of radiances is performed on water pixels to compute the transmittances.

The block diagram in fig. 5.3.3-1 below shows the control flow for step 2.6.12.

---

\* this correction uses the assumption, that both total Ozone and zenith angles variations within the 4x4 pixels window are so small that they have no effect on the computation, either in RR or in FR mode.

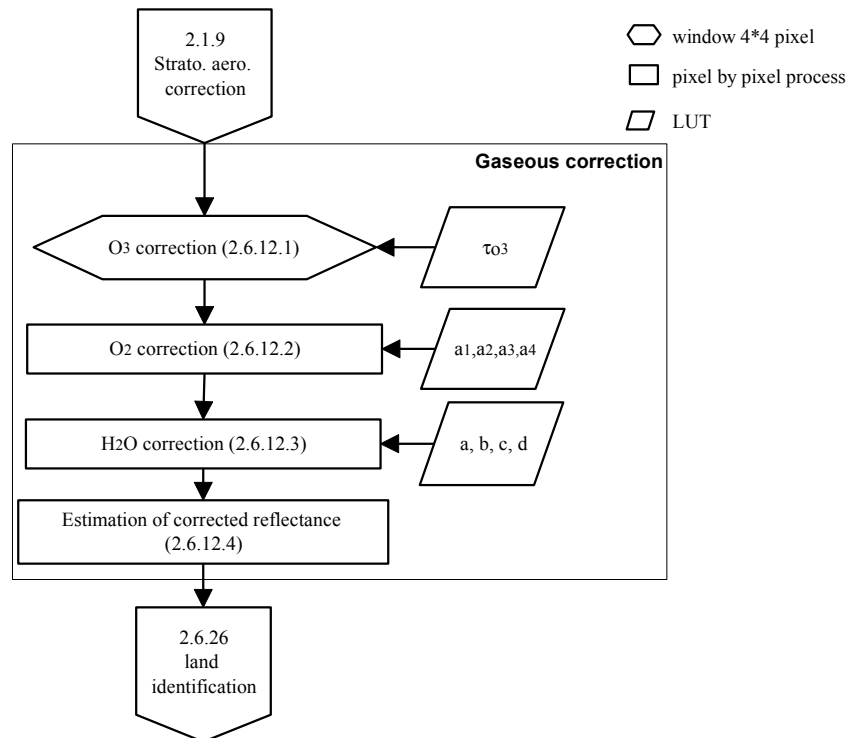

Figure 5.3.3-1: Gaseous correction processing (step 2.6.12)

### 5.3.4 - Land Identification (step 2.6.26) and Smile Effect Correction (step 2.1.6)

The purpose of this classification is to identify using geo-physical data, land from water pixels in cases where the Level1b *a priori* classification leads to ambiguities which may occur from:

- geo-location error;
- land /ocean atlas error: uncharted land or water, etc.;
- transient emerged land: tidal flats, etc.

These cases are identified using the Surface Confidence Map, an atlas identifying zones of low-confidence in the *a priori* land/water classification map used in the level1b. When the Surface Confidence Map indicates high confidence classification, the Land Identification radiometric tests are by-passed and the *a priori* classification is kept.

#### *Inland water*

First, a test on the reflectance corrected for gaseous absorption at 665 nm is performed to identify the darkest pixels. The TOA reflectance at 665 nm is compared to a threshold interpolated from a LUT.

For the pixels having a reflectance smaller than this threshold, a second test is made to compare the TOA reflectance at 665 nm with the TOA reflectance at 865 nm ; if the TOA reflectance at 665 nm is greater than the reflectance at 865 nm, the pixel is classified as water.

#### *Land in water*

The purpose of this test is to identify pixels of emerged land, flagged as "water" in the L1B product. It is the opposite of the Inland water test.

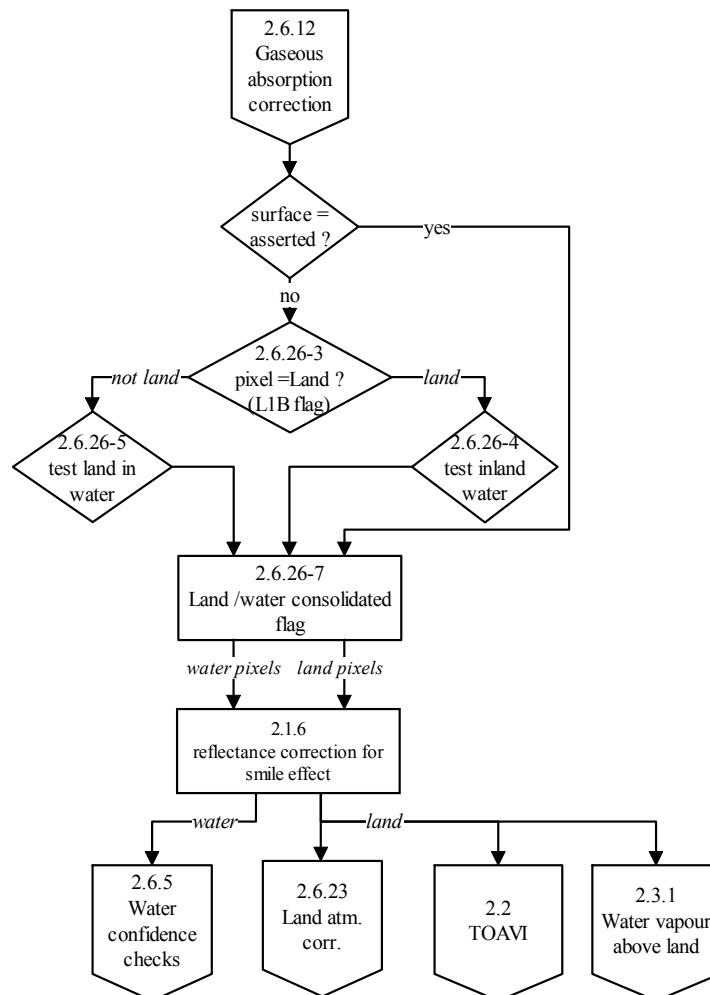

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name** : MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 5-5

The purpose of the Smile Effect Correction is to correct TOA reflectance (already corrected for stratospheric aerosols and gaseous absorption) for small scale variations due to non-constant central wavelength of a given band across the field of view. Correction is made only for a subset of bands for which those variations can induce severe distortions after corrections based on fixed wavelength scheme (e.g. Rayleigh diffusion correction). This subset of bands, which is specific to each land and water surface type, should ensure smoothness of reflectance local variations with wavelength and allow a good estimation of the reflectance derivative using neighbour bands.

The block diagram in figure 5.3.4-1 below shows the control flow in step 2.6.26.

**Note** : Steps 2.6.4 and 2.6.31, because of their simplicity, are only shown in the corresponding equation section.

## 5.5.6 - Procedure *ref\_rayleigh* to estimate Rayleigh reflectance (step. 2.1.17)

The List of Variables below identifies the dummy input, output and locally computed variables of the procedure. Actual inputs and outputs should be traced to whichever algorithm step the procedure is called from. Other variables of the procedure, read from an auxiliary parameters file, are listed in table of variables in section 3.4 above.

Variable	Descriptive Name	T	U	Range
$\theta_s$	Sun zenith angle	i	deg	
$\theta_v$	Viewing zenith angle	i	deg	
$\Delta\phi$	Azimuth angle between pixel-sensor and pixel-sun plane	i	deg	
M	air mass	i	dl	
$\tau_{R0}(b)$	Rayleigh optical thickness at actual surface pressure	i	dl	b in {bands}
bands	list of bands for which the reflectance is to be computed	i	dl	
$P_R^{(s)}$	Fourier components of Rayleigh scattering phase function	c	dl	s: 0..2
$a^{(s)}, b^{(s)}, c^{(s)}, d^{(s)}$	Polynomial coefficients for each of the Fourier components of the correction factor for Rayleigh multiple scattering	c	dl	a, b, c, d: polynomial order 0 to 3 s: Fourier series order 0..2
$\rho_{R,P}^{(s)}(b)$	Fourier components of Rayleigh reflectance in single scattering approximation for 4x4 sub-window	c	dl	b in {bands} s: 0..2
$f_R^{(s)}(b)$	Fourier components of correction factor for Rayleigh multiple scattering for 4x4 sub-window	c	dl	<i>idem</i>
$\rho_R^{(s)}(b)$	Fourier components of Rayleigh reflectance for 4x4 sub-window	c	dl	<i>idem</i>
$\rho_{R1}(b)$	Rayleigh reflectance	o	dl	b in {bands}

The *ref\_rayleigh* procedure is called by steps 2.1.7, 2.6.15.1.

The *ref\_rayleigh* procedure is defined as follows:

compute Fourier components of Rayleigh phase function

$$P_R^{(0)} = \frac{3}{4} \cdot A \cdot [1 + \cos^2(\theta_s) \cos^2(\theta_v) + 0.5 \cdot \sin^2(\theta_s) \cdot \sin^2(\theta_v)] + B \quad (2.1.17-1)$$

$$P_R^{(1)} = -\frac{3}{4} \cdot A \cdot \cos(\theta_s) \cdot \cos(\theta_v) \cdot \sin(\theta_s) \cdot \sin(\theta_v) \quad (2.1.17-2)$$

$$P_R^{(2)} = \frac{3}{16} \cdot A \cdot \sin^2(\theta_s) \cdot \sin^2(\theta_v) \quad (2.1.17-3)$$

**For each** Fourier series component order s **in 0..2**

compute Fourier components of correcting factor for multiple scattering)

$$a^{(s)} = \text{Rayscatt\_coef\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (s, k=1) \quad (2.1.17-4)$$

$$b^{(s)} = \text{Rayscatt\_coef\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (s, k=2) \quad (2.1.17-5)$$

$$c^{(s)} = \text{Rayscatt\_coef\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (s, k=3) \quad (2.1.17-6)$$

$d^{(s)} = \text{Rayscatt\_coef\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (s, k=4)$  (2.1.17-7)  
**Endfor** *End of loop on Fourier series order*

**For each band b in {bands}**

**For each Fourier series component order s in 0..2**  
*compute components of Rayleigh reflectance for primary scattering*

$$\rho_{R,P}^{(s)}(b) = \frac{P_R^{(s)}}{4(\cos\theta_s + \cos\theta_v)} \left( 1 - e^{-\tau_{R0}(b) \cdot M} \right) \quad (2.1.17-8)$$

$$f_R^{(s)}(b) = a^{(s)} + b^{(s)}(\tau_{R0}(b)) + c^{(s)}(\tau_{R0}(b))^2 + d^{(s)}(\tau_{R0}(b))^3 \quad (2.1.17-9)$$

*compute Fourier components of Rayleigh reflectance*

$$\rho_R^{(s)}(b) = \rho_{R,P}^{(s)}(b) * f_R^{(s)}(b) \quad (2.1.17-10)$$

**Endfor** *End of loop over index s*

*compute Rayleigh reflectance as a Fourier sum*

$$\rho_{R1}(b) = \rho_R^{(0)}(b) + 2 \rho_R^{(1)}(b) \cos(\Delta\phi) + 2 \rho_R^{(2)}(b) \cos(2\Delta\phi) \quad (2.1.17-$$

11)

**Endfor** *End of loop over band b*

*End of ref\_rayleigh procedure*

**5.5.7 - Procedure *ref\_aerosol* to estimate Aerosol reflectance (step 2.1.18)**

The List of Variables below identifies the dummy input, output and locally computed variables of the procedure. Actual inputs and outputs should be traced to whichever algorithm step the procedure is called from. Other variables of the procedure, read from an auxiliary parameters file, are listed in table 3.4 above.

Variable	Descriptive Name	T	U
$\theta_s$	Sun zenith angle	i	deg
$\theta_v$	Viewing zenith angle	i	deg
$\Delta\phi$	Azimuth angle between pixel-sensor and pixel-sun plane	i	deg
M	air mass	i	dl
Iaer	index for aerosol multiple scattering LUTs	i	dl
$\tau_a$	aerosol optical thickness	i	dl
$Px\omega_0$	Phase function times single scattering albedo	i	dl
$\rho_{a,p}$	Aerosol reflectance in primary scattering approximation	c	dl
$aa^{(s)}, ba^{(s)}, ca^{(s)}, da^{(s)}$	Polynomial coefficients for each of the Fourier components of the correction factor for multiple scattering	c	dl
$f_a^{(s)}$	Fourier components of the correction factor for multiple scattering	c	dl
$f_a$	Correction factor for multiple scattering	c	dl
$\rho_a$	aerosol reflectance	o	dl

The *ref\_aerosol* procedure is defined as follows:

(deleted 2.1.18-1, 2.1.18-2)

Estimate aerosol reflectance for primary scattering

$$\rho_{a,p} = \frac{Px\omega_0}{4(\cos(\theta_s) + \cos(\theta_v))} \left( 1 - e^{-\tau_a \cdot M} \right) \quad (2.1.18-3)$$

Compute Fourier components of correcting factor for aerosol multiple scattering

**For each Fourier series component order s in 0..5**

$$aa^{(s)} = \text{Aermult\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (iaer, s, k=1) \quad (2.1.18-4)$$

$$ba^{(s)} = \text{Aermult\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (iaer, s, k=2) \quad (2.1.18-5)$$

$$ca^{(s)} = \text{Aermult\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (iaer, s, k=3) \quad (2.1.18-6)$$

$$da^{(s)} = \text{Aermult\_LUT interpol} : (\theta_s, \theta_v) \text{ select} : (iaer, s, k=4) \quad (2.1.18-7)$$

$$f_a^{(s)} = aa^{(s)} + ba^{(s)}(\tau_a) + ca^{(s)}(\tau_a)^2 + da^{(s)}(\tau_a)^3 \quad (2.1.18-8)$$

**Endfor** End of loop over index s

Compute correcting factor for aerosol multiple scattering as Fourier sum

$$f_a = f_a^{(0)} + 2f_a^{(1)} \cos(\Delta\phi) + 2f_a^{(2)} \cos(2\Delta\phi) + 2f_a^{(3)} \cos(3\Delta\phi) + 2f_a^{(4)} \cos(4\Delta\phi) + 2f_a^{(5)} \cos(5\Delta\phi) \quad (2.1.18-9)$$

*Compute aerosol reflectance, corrected for multiple scattering*

$$\rho_a = \rho_{a,p} \cdot f_a \quad (2.1.18-10)$$

**return**  $\rho_a$  (2.1.18-11)

*End of ref\_aerosol procedure*

### 5.5.8 - procedure *ref\_smile\_corr* to correct reflectance for smile effect (step 2.1.6)

The List of Variables below identifies the dummy input, output and locally computed variables of the procedure. Actual inputs and outputs should be traced to whichever algorithm step the procedure is called from. Other variables of the procedure, read from an auxiliary parameters file, are listed in table 3.4 above.

Variable	Descriptive Name	T	U
$\rho_{ng}(b)$	TOA reflectance, corrected for stratospheric aerosol contribution and gaseous absorption	i	deg
RefCorr_sw(b)	Array of switch controlling reflectance correction for each band	i	deg
RefCorr_b(b,i)	Array of band indices to be used as lower (i=1) and upper (i=2) points for reflectance derivative computation	i	deg

## 6. - TOTAL WATER VAPOUR RETRIEVAL

### 6.1. - Introduction

This chapter describes the algorithm to be applied to the MERIS signals in order to retrieve the atmospheric water vapour content (see RD8, section 2.4).

### 6.2. - Algorithm Overview

This algorithm is applied to land, water and cloud pixels. It is based on a differential absorption method using two spectral bands close to each other (one within the absorption band and the other outside the absorption band). **The retrieval algorithm depends on the target nature in order to cope with the surface reflectivity and the physical processes involved:**

- Land or water with significant Sun glint (bright reflective surfaces),
- Water without significant glint (dark reflective surfaces) or
- Clouds (reflection with significant penetration depth).

**The Water Vapour retrieval over Land surface uses a neural network approach.**

The algorithms **over water (outside significant Sun glint) and over clouds** consist in **polynomials of the logarithm of the ratio of TOA radiance (corrected for stratospheric aerosols if required) at band 15 (900 nm, within the water vapour absorption region) to TOA radiance at band 14 (885 nm, outside water vapour absorption).** Above water surfaces, the algorithm takes into account the aerosol optical depth, except when Sun glint is significant.

Polynomial coefficients depend on illumination and viewing geometry, surface type, **aerosol optical thickness (above water), cloud properties and surface albedo** (above clouds), for any given pixel. That dependence is coded in look-up tables.

The diagram in figure 6.2-1 below shows the logic of the water vapour retrieval algorithm.

**Page** : 6 - 3

## 6.3 - Mathematical Description Of Algorithm

The spectral bands centred at 885 nm and 900 nm have proven to be the best suited for the retrieval of water vapour over all surfaces. The total water vapour is computed thanks to surface dependent algorithms: a Neural Network over Land and very bright waters (high Sun glint or Sea ice) and polynomials over water and clouds. In the latter case, the algorithms are implemented in two steps. In a first step, depending on the type of pixel: water or cloud, polynomial coefficients are read from LUT. The ratio of TOA radiances (corrected for stratospheric aerosols if needed) at 885nm and 900nm is corrected for tropospheric aerosols over water. The second step is a simple polynomial applied to the (corrected) radiance ratio.

### 6.3.1. - Water vapour retrieval over land surfaces (step 2.3.1)

The Water Vapour is retrieved over Land using a Neural Network. It takes as input variables representative of

- ❖ the illumination and viewing geometry,
- ❖ the surface albedo spectral variation between 885 and 900 nm,
- ❖ the normalised radiance in channel 14 (885nm) and the estimated transmission at 900 nm,
- ❖ the normalised radiance in channel 19 (754nm), the estimated transmission of molecular oxygen around 761nm, and the actual central wavelength of channel 11,
- ❖ the surface pressure estimated from the above three inputs (see section 4).

### 6.3.2. - Water vapour retrieval over water surfaces (steps 2.3.2, 2.3.5)

Outside the Sun glint region, the retrieval of the total water vapour over water surfaces is more difficult than over land surfaces because of the larger influence of aerosols. The polynomial coefficients take into account aerosol influence. Also in order to improve noise performance, 4x4 pixel averaging is performed as a pre-processing step.

In the Sun glint region, the same algorithm as above land is applied.

### 6.3.3. - Water vapour retrieval over clouds (step 2.3.3)

Polynomial coefficients take into account the cloud optical thickness and the albedo of the underlying surface.

### 6.3.4 – Range checks (steps 2.3.0, 2.3.6)

Range checks are performed on radiance at the algorithm input. Out of range radiance result in an exception, water vapour is not processed. When processed, the water vapour is also checked for range, the product is kept but a flag is raised when out of range.

### 6.3.5 - Water vapour polynomial (function)

The algorithm consists in a second-degree polynomial equation using the logarithm of the ratio of TOA radiance at 885 and 900 nm and coefficients. All polynomial parameters are provided by steps 2.3.1, 2.3.2, 2.3.3 depending on the type of pixel.

### 6.5.7.2. – Equations

$$WV = a_{wv} + b_{wv} \cdot \log(T) + c_{wv} \cdot \log^2(T)$$

Return WV

**Exception processing:**  $T \leq 0$

water vapour process failed (see 6.7 below)

**End exception processing:**

## 6.6. - Quality Control and Diagnostics

Input values of radiance at 885 nm, at 900 nm are checked, out of range values are not processed (see 2.3.0-1).

When any of the interpolation index variables  $\mu_s, \mu_v, \Delta\phi, \alpha_{surf}$ , are outside of the LUTs index range, the nearest LUT values are used as explained in §2 above; the flag ORINPWV\_F is set to TRUE and the pixel is processed.

Output values out of the range [OUT\_MIN, OUT\_MAX]  $g.cm^{-2}$  are flagged by setting the OROUTWV\_F flag to TRUE (see 2.3.6-1).

## 6.7. - Exception Handling

Exception processing: Water vapour process failed:

$$W_T(j,f) = \text{BAD\_VALUE} \quad (2.3-1)$$

$$\text{ORINPWV\_F}(j,f) = \text{TRUE} \quad (2.3-$$

2)

$$\text{OROUTWV\_F}(j,f) = \text{TRUE}. \quad (2.3-$$

3)

skip the rest of water vapour processing for pixel (j, f)

end of exception processing

## 7. - Cloud processing

### 7.1. - Introduction

This chapter describes the MERIS level 2 cloud processing module for retrieving the albedo, optical thickness and type of clouds from TOA radiance data (RD 8, sections 2.1, 2.3).

### 7.2. - Algorithm Overview

The flow chart in figure 7.2-1 below describes the breakdown of the cloud processing module. Pixels output from the Pixel Identification module (step 2.1) and flagged as cloudy (CLOUD\_F = true) are processed in order to retrieve the cloud albedo (step 2.4.1) and the cloud optical thickness (step 2.4.3). Cloud top pressure is already known from step 2.1. From the optical thickness and top pressure, the cloud type index is computed (step 2.4.8). It should be noted that cloud reflectance, written in the L2 product, is the TOA reflectance (corrected for stratospheric aerosol if needed)  $\rho$  (b, j, f), computed at step 2.1.

*Figure 7.2-1 : MERIS Level 2 Cloud Processing (step 2.4)*

## 7.3. -Mathematical Description of Algorithm

### 7.3.1. - Cloud Albedo processing (step 2.4.1)

The cloud albedo processing relates the cloud albedo  $\alpha_c$  to the MERIS radiance in channel 10 (753.75 nm) using a polynomial regression technique. The polynomial coefficients are read from a Look Up Table (RD 7, 3.1.4) as a function of geometry (sun zenith angle, viewing angle and azimuth angle) and estimated surface albedo. The algorithm is detailed in RD 8, 2.1.

### 7.3.2. - Cloud Optical Thickness processing (step 2.4.3)

To retrieve the cloud optical thickness  $\tau_c$ , the same technique is used as for retrieving the cloud albedo. A polynomial expression relates the cloud optical thickness  $\tau_c$  as a function of the MERIS radiance in channel 10. The polynomial coefficients are read from a Look Up Table (RD 7, 3.1.5) as a function of geometry and estimated surface albedo. The algorithm is detailed in RD 8, 2.2.

### 7.3.3. - Cloud type processing (step 2.4.8)

The algorithm uses a simple classification table indexed by the cloud optical thickness and cloud top pressure, to provide a cloud type index.

## 7.5. - Equations

For each pixel (j, f) such that (INVALID\_F(j, f) == FALSE) AND (CLOUD\_F(j, f) == TRUE)

Let  $\mu_s = \cos(\theta_s, j, f)$ ,  $\mu_v = \cos(\theta_v, j, f)$ ;

$$L_T(b753, j, f) = \rho(b753, j, f) \cdot F_0^C(b753) \cdot \mu_s / \pi \quad (2.4-1)$$

### 7.5.1 - Cloud Albedo processing (step 2.4.1)

The polynomial coefficients  $a_{al}$ ,  $b_{al}$ , and  $c_{al}$  are obtained by interpolation in the LUTs (RD 7, 3.17.2.3) as a function of the sun zenith angle, viewing angle and azimuth angle and the surface albedo.

$$a_{al} = \text{Calb\_LUT interpol}:(\mu_s, \mu_v, \Delta\phi, j, f) \text{ nearest}:(\alpha_{\text{surf}}, j, f) \text{ select}:(k=1) \quad (2.4.1-1)$$

$$b_{al} = \text{Calb\_LUT interpol}:(\mu_s, \mu_v, \Delta\phi, j, f) \text{ nearest}:(\alpha_{\text{surf}}, j, f) \text{ select}:(k=2) \quad (2.4.1-2)$$

$$c_{al} = \text{Calb\_LUT interpol}:(\mu_s, \mu_v, \Delta\phi, j, f) \text{ nearest}:(\alpha_{\text{surf}}, j, f) \text{ select}:(k=3) \quad (2.4.1-3)$$

**exception processing:** out of LUT range  $\mu_s, \mu_v, \Delta\phi(\phi, \phi)$  in equations (2.4.1-1) to (2.4.1-3) above:

use extreme range index value (see section 2.4.3 above)

ORINP1\_F(j, f) = TRUE

continue at next equation  
**end of exception processing**

*The cloud albedo  $\alpha_c$  and the MERIS radiance at 753.75 nm are related using a second order polynomial:*

$$\alpha_c(j, f) = a_{al} + b_{al} \cdot L_T(b753, j, f) + c_{al} \cdot (L_T(b753, j, f))^2 \quad (2.4.1-4)$$

### 7.5.2. - Cloud Optical Thickness processing (step 2.4.3)

*The polynomial coefficients  $a_{th}$ ,  $b_{th}$ ,  $c_{th}$ , and  $d_{th}$  are interpolated from a LUT as a function of  $\mu_s$ ,  $\mu_v$ , and  $\Delta\phi$  and the surface albedo  $\alpha_{surf}$ .*

$$a_{th} = \text{Cthick\_LUT interpol:}(\mu_s, \mu_v, \Delta\phi(j, f)) \text{ nearest: } (\alpha_{surf}(j, f)) \text{ select:}(k=1) \quad (2.4.3-1)$$

$$b_{th} = \text{Cthick\_LUT interpol:}(\mu_s, \mu_v, \Delta\phi(j, f)) \text{ nearest: } (\alpha_{surf}(j, f)) \text{ select:}(k=2) \quad (2.4.3-2)$$

$$c_{th} = \text{Cthick\_LUT interpol:}(\mu_s, \mu_v, \Delta\phi(j, f)) \text{ nearest: } (\alpha_{surf}(j, f)) \text{ select:}(k=3) \quad (2.4.3-3)$$

$$d_{th} = \text{Cthick\_LUT interpol:}(\mu_s, \mu_v, \Delta\phi(j, f)) \text{ nearest: } (\alpha_{surf}(j, f)) \text{ select:}(k=4) \quad (2.4.3-4)$$

**exception processing:** out of LUT range  $\mu_s$ ,  $\mu_v$ ,  $\Delta\phi(\phi, \phi)$  in equations (2.4.3-1) to (2.4.3-4) above:

use extreme range index value (see section 2.4.3 above)

ORINP2\_F(j, f) = TRUE

continue at next equation

**end of exception processing**

*The relationship between output  $\tau_c$  and input  $L_T$  is described by the polynomial :*

$$\tau_c(j, f) = \exp [a_{th} + b_{th} \cdot L_T(b753, j, f) + c_{th} \cdot (L_T(b753, j, f))^2 + d_{th} \cdot (L_T(b753, j, f))^3] \quad (2.4.3-5)$$

### 7.5.3. - Cloud type index processing (step 2.4.8)

*A simple cloud type index is computed from the cloud geo-physical products: cloud top pressure, cloud optical thickness.*

$$\text{Find kd such that } Ctype\_delta\_range[kd] \leq \tau_c(j, f) < Ctype\_delta\_range[kd+1] \quad (2.4.8-1)$$

$$\text{Find kp such that } Ctype\_P\_range[kp] \leq P_{top}(j, f) < Ctype\_P\_range[kp+1] \quad (2.4.8-2)$$

**exception processing:** out of range optical thickness or pressure in eq. 2.4.8-1, 2.4.8-2 above:

use extreme range index

continue at next equation

**end of exception processing**

$$Ctype(j, f) = Ctype\_LUT[kd][kp] \quad (2.4.8-3)$$

## 7.6. - Quality Control and Diagnostics.

When any of  $\mu_s$ ,  $\mu_v$ ,  $\Delta\phi(j, f)$ ,  $\alpha_{\text{surf}}(j, f)$  are outside of the LUTs index range, the nearest LUT values are used as explained in §2 above; the flag ORINP1\_F or ORINP2\_F is set to TRUE and the pixel is processed.

If  $\alpha_c(j, f)$  is found negative, then the flag OROUT1\_F is set to TRUE.

## 7.7. - Exception Handling

See the blocks "exception processing:... end of exception processing" in section 7.5 above.

## 8 - Water Processing

### 8.1 Overview

The processing of water pixels is intended to provide the following Level 2 products:

a) quantitative

- normalised water-leaving reflectance at bands 412.5, 442.5, 490, 510, 560, 620, 665, 681.25, 705, 753, 775, 865, 885 nm
- algal pigment index 1
- algal pigment index 2
- total suspended matter
- yellow substance absorption at 442.5nm
- photosynthetically available radiance (PAR)
- aerosol optical thickness at 865nm
- aerosol Angström exponent (775, 865)

b) qualitative

- turbid case 2 water;
- yellow substance loaded case 2 water;
- water with excessive scattering;
- continental absorbing aerosol;
- desert dust absorbing aerosol;

as well as flags relevant to the quality of all products.

The block diagram in figure 8.1-1 below shows the general logic of the main processing steps. These steps are detailed in the following sections 8.2: water confidence checks, 8.3: turbid water screening and correction, 8.4: atmosphere correction, 8.5: ocean colour processing, [8.6 Case 2 R processing](#).

## 8.2. - Water Confidence Checks (step 2.6.5)

### 8.2.1 - Mathematical Description of the Algorithm

Water confidence checks include processing of Sun glint, flagging of low pressure and whitecaps and vicarious adjustment. The first steps use the wind and pressure provided in the L1B product annotations and interpolated at pixel. The vicarious gains are applied at the end of these steps.

#### 8.2.1.1 - Glint processing (step 2.6.5.1)

Glint processing applies only to water pixels. It is described in RD 8, 2.13.

- *Glint estimation*

The Sun glint reflectance  $\rho_g$  is calculated (step 2.6.5.1.1) by interpolation in LUT produced using the Cox and Munk model (1954) as a function of geometry, wind speed modulus and direction. An estimate of glint reflectance is produced. Wind speed modulus and wind direction are computed from the  $W_u$  and  $W_v$  annotations.

Note: Sun glint reflectance is now an input to current step as its computation a been moved to section 5.

- *Glint classification (low, medium or high glint ?)*

This glint reflectance is compared to a low glint threshold (step 2.6.5.1.3). If the glint reflectance is below this low glint threshold then no glint correction for this pixel is applied. If the pixel is not bright then it is further processed by step 2.6.5.3. If bright, it is flagged as ice or high aerosol load.

If the glint reflectance is above the low glint threshold then the glint reflectance is compared to a medium glint threshold (step 2.6.5.1.4).

If the glint reflectance is below the medium glint threshold then a medium glint flag is raised and the pixel is corrected for glint reflectance in step 2.6.5.1.7.

If the glint reflectance is above the medium glint threshold then no correction is applied and the pixel is flagged as uncorrected sun glint (step 2.6.5.1.5).

- *Glint correction in case of medium glint (step 2.6.5.1.7)*

The glint reflectance at surface level is transferred to the Top Of Atmosphere by applying a direct atmospheric transmission term (including Rayleigh scattering on both sun-surface and surface sensor paths). The Top Of Atmosphere glint reflectance  $\rho_g^*$  is then subtracted from the TOA reflectance.

**Note** : step 2.6.5.1.8, because of its simplicity, is only shown in the corresponding equation section.

#### 8.2.1.2 – Low pressure water flagging (step 2.6.5.2)

Surface pressure (from ECMWF annotation) is compared with a threshold in order to flag low pressure, typically high altitude inland waters. Above such waters, the results of the atmosphere correction are disturbed.

# MERIS ESL

**Name** : MERIS Level 2 Detailed Processing Model  
**Issue** : 8      **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 8 - 4

### 8.2.1.3 – Whitecaps Flagging (step 2.6.5.3)

The modulus of the wind speed is compared to a threshold. Above that threshold a whitecap flag is raised because white caps are likely to disturb the performance of the atmosphere correction (RD 8, 2.14)

### 8.2.1.3 – Reflectance threshold on reflectance at 412 nm (step 2.6.5.4)

An additional “bright” pixels screening, specific to water pixels, is performed by comparison of the Glint corrected reflectance at 412 nm with a pre-computed threshold. It is intended to further sort out and flag those pixels affected by sea-ice, partial clouds or very high aerosol load.

### 8.2.1.4 – Vicarious adjustment (step 2.6.5.5)

The glint corrected TOA signal is finally adjusted by a multiplicative gain (band per band) before entering the atmospheric corrections steps, i.e. before BPAC and Case 1 atmospheric corrections. Those pre-computed gains aims at removing any bias in the {instrument + processing} chain in order to optimally retrieve water-leaving reflectance.

## 8.3 Turbid water screening and corrections (steps 2.6.8.1 to 2.6.8.8)

This section describes the algorithms used

1. in steps 2.6.8.2 to 2.6.8.5, to detect Case 2 turbid waters based on radiometry (reflectance corrected for stratospheric aerosol, gaseous absorption, Sun glint, Rayleigh), initiate the first iterate of NIR water-leaving reflectance and choose the appropriate band set for further steps;
2. in step 2.6.8.6 to 2.6.8.8, to compute the water-leaving reflectance for Case 2 turbid waters at b705, b775, b865 and b885, needed before entering the atmospheric corrections processing over Case 1 waters (step 2.6.9) and provide an estimate of the total suspended matter used in turn to identify sediment dominated case 2 waters through a dedicated flag.

### 8.3.1 - Mathematical description

#### 8.3.1.1 - Water identification and initial estimate

##### 8.3.1.1.1 Coarse Rayleigh correction and diffuse transmittance computation (step 2.6.8.2)

The Rayleigh reflectance corrected for pressure is removed to the rho\_gc signal to compute rho\_rc used further in the algorithm. The diffused transmittance is approximated taking only into account the Rayleigh contribution.

##### 8.3.1.1.2 - White scatterer identification (step 2.6.8.3)

An estimate of the spectral slope of marine backscatter is computed using Rayleigh corrected reflectance and pure water specific absorption. This estimated spectral slope is compared to a threshold below which the White Scatterer Flag is raised. The IOPS (sediment backscatter slope and absorption) are chosen according to the white scattering flag for use in subsequent calculations.

##### 8.3.1.1.3 - Turbid water identification (steps 2.6.8.4 and 2.6.8.5)

The turbid water identification is described in RD 8, 2.5.

If one of the Rayleigh corrected TOA reflectances at b705 or b865 is negative, then it is assumed that the ocean reflectance is insufficient to calculate the water vapour above ocean product correctly and no further computations are required by the turbid water reflectance (note the flag F\_ORINPWV can also be used from wvo products). The BPAC flag is set to FALSE and the algorithm stops, returning the value of pure water.

Otherwise, the marine reflectances are computed at b705, b775, b865 and b885 using the Angström exponent method from Rayleigh corrected reflectances at two band sets: {b705, b775} and {b865, b885}. Then the TOA marine reflectance at b775 derived from the second bandset is compared to thresholds and raises flags to indicate whether the BPAC iterative calculations should be carried out on either or both of the {b705, b775, b865} and {b775, b865, b885} band set. Eventually, in case of the first bandset is activated, the marine reflectance at b705 is compared to a threshold determined by the mean gain and solar flux at b705. If it is below the threshold then BPAC flag is set to FALSE and algorithm stops, returning the value of pure water.

**Page** : 8 - 12

### 8.3.1.2 Turbid water correction (step 2.6.8.6 to 2.6.8.)

When a water pixel has been detected as contaminated by a water signal in the infra-red by test 2.6.8.1, the algorithm called bright pixel procedure performs an estimate of the water-leaving reflectance at four bands used later by the atmosphere corrections above water (see 8.4 below). The algorithm is based on optical properties of the water and performs an iterative procedure with a combination of:

- single scattering aerosol reflectance;
- water-leaving reflectance;

The iterative procedure is performed on either or both of the {b705, b775, b865} and {b775, b865, b885} bandsets. The former bandset applies to low to medium turbidity waters and the latter bandset applies to highly turbid waters. There is an overlap in the applicability of the bandsets and where both bandsets are used, then a simple average of the results are used to avoid image artifacts.

Note that in condition of non-corrected glint (i.e. flag HIGH\_GLINT and not MEDIUM\_GLINT), only the low bandset is used, in order to retrieve proper SPM and activate correctly the CASE2\_S flag.

The atmospheric attenuation of water-leaving reflectance is taken into account.

The logic of the turbid waters correction is shown in block diagram below:

### 8.3.3 - Detailed Algorithm Specification

Note that the subscripts (j,f) may be omitted for clarity, all equations pertain to pixel(j,f).

#### 8.3.3.1 Turbid pixel screening and atmospheric correction (step 2.6.8.1)

**For each pixel (j,f) such that**

(INVALID\_F == FALSE) AND (CLOUD\_F == FALSE) AND (LANDCONS\_F == FALSE)

(2.6.8.1-1)

**BPAC\_ON\_F(j, f) = TRUE**

(2.6.8.1-1b)

**activate** Water identification and initial estimates (steps 2.6.8.2 to 2.6.8.5)

**If** (BPAC\_ON\_F (j, f)) **then**

**activate** Iterative estimate of Angström exponent, IOPs and water leaving reflectances (steps 2.6.8.6 to 2.6.8.7)

**activate** Estimate of TOA marine reflectances and TSM (step 2.6.8.8)

*Raise CASE2\_S flag wrt TSM concentration*

CASE2\_S(j,f) = (SPM<sub>br</sub>(j, f) > SPM\_Case2\_Thresh) (2.6.8.1-2)

**End if**

*Check again WHITE\_SCATT flag once BPAC has run*

WHITE\_SCATT\_F(j,f) = WHITE\_SCATT\_F(j,f) AND BPAC\_ON\_F(j,f) (2.6.8.1-3)

*Update ICE\_HIGHAERO flag*

**If** (WHITE\_SCATT\_F(j,f) AND ICE\_HIGHAERO\_F(j,f)) **then**

ICE\_HIGHAERO\_F(j,f) = FALSE (2.6.8.1-4)

**Endif**

*Transfer BPAC flags to annotation*

ANNOT\_BPAC(j,f)=0 (2.6.8.1-5)

**If** do\_bandset(bsLOW) **then**

set bit DO\_BANDSET\_LOW of ANNOT\_BPAC(j,f) (2.6.8.1-6)

**If** converge(bsLOW) **then**

set bit CONVERGE\_LOW of ANNOT\_BPAC(j,f) (2.6.8.1-7)

**If** error(bsLOW) **then**

set bit ERROR\_LOW of ANNOT\_BPAC(j,f) (2.6.8.1-8)

**Endif**

**If** do\_bandset(bsHIGH) **then**

set bit DO\_BANDSET\_HIGH of ANNOT\_BPAC(j,f) (2.6.8.1-9)

**If** converge(bsHIGH) **then**

set bit CONVERGE\_HIGH of ANNOT\_BPAC(j,f) (2.6.8.1-10)

**If** error(bsHIGH) **then**

set bit ERROR\_HIGH of ANNOT\_BPAC(j,f) (2.6.8.1-11)

**endif**

**End for**

### 8.3.3.2 Water identification and initial estimate (steps 2.6.8.2 to 2.6.8.5)

*Coarse Rayleigh correction and diffuse transmittance computation (step 2.6.8.2)*

**For each** band b in {b620, b705, b775, b865, b885}

$$\rho_{rc}(b, j, f) = \text{ROGC}(b, j, f) - \rho_{R0}(b, j, f) \quad (2.6.8.2-1)$$

$$t_d(b) = \exp \left[ -\frac{\tau_{R0}(b)}{2} \cdot \left( \frac{1}{\mu_s(j, f)} + \frac{1}{\mu_v(j, f)} \right) \right] \quad (2.6.8.2-2)$$

**End for** *End of loop over bands*

*White Scatterer identification (step 2.6.8.3)*

**If** ( $\rho_{rc}(b620, j, f) \leq 0$  **OR**  $\rho_{rc}(b705, j, f) \leq 0$ ) **then**

$$\text{WHITE\_SCATT\_F}(j, f) = \text{FALSE} \quad (2.6.8.3-1)$$

**Else**

$$\alpha_{\text{water}} = \frac{\log \left( \frac{\rho_{rc}(b620, j, f) \cdot a_{w-620} / t_d(b620)}{\rho_{rc}(b705, j, f) \cdot a_{w-705} / t_d(b705)} \right)}{\log \left( \lambda_{\text{theo}}(b620) / \lambda_{\text{theo}}(b705) \right)} \quad (2.6.8.3-2)$$

$$\text{WHITE\_SCATT\_F}(j, f) = (\alpha_{\text{water}} < \alpha_{\text{Scatt\_Threshold}}) \text{ AND BPAC\_ON\_F}(j, f) \quad (2.6.8.3-3)$$

**Endif**

*Initialise do\_bandset, error and converge*

**For each** bs in {bsLOW, bsHIGH}

$$\text{do\_bandset}(bs) = \text{error}(bs) = \text{converge}(bs) = \text{FALSE} \quad (2.6.8.4-0)$$

*Turbid water identification and initial estimates (step 2.6.8.4)*

**If** ( $\rho_{rc}(b865, j, f) \leq 0$ ) **OR** ( $\rho_{rc}(b705, j, f) \leq 0$ ) **then**

$$\text{BPAC\_ON\_F}(j, f) = \text{FALSE} \quad (2.6.8.4-1)$$

$$\text{CASE2\_S}(j, f) = \text{FALSE} \quad (2.6.8.4-2)$$

$$\text{ACFAIL\_F}(j, f) = \text{TRUE} \quad (2.6.8.4-3)$$

$$\text{continue to step 2.6.8.8 - return clear water reflectances} \quad (2.6.8.4-4)$$

**Endif**

*Adjust IOPs according to sediment type (coccoliths or particles)*

**If** WHITE\_SCATT\_F(j, f) **then**

**For each** b in {b705, b775, b865, b885} **do**

$$\text{bbp\_star}(b) = \text{bbp\_star\_c}(b) \quad (2.6.8.4-5)$$

$$\text{a\_to\_bb}(b) = \text{a\_to\_bb\_c}(b) \quad (2.6.8.4-6)$$

**Endfor**

**Else**

### 8.3.4 - Quality control and diagnostics

The annotation flag has been introduced within the BPAC scheme, to provide the breakpoints with indications about the course of the algorithm. This flag (variable “ANNOT\_BPAC”) is represented by 2 bytes. Each bit implements a Boolean flag, corresponding to the activation and course of the iterative loop of a given bandset:

symbol	bit pos.	Meaning
DO_BANDSET_LOW	0	Bandset Low is activated
DO_BANDSET_HIG H	1	Bandset High is activated
CONVERGE_LOW	2	Error in the iterative estimate for bandset Low
CONVERGE_HIGH	3	Error in the iterative estimate for bandset High
ERROR_LOW	4	Convergence of the iterative estimate for bandset Low
ERROR_HIGH	5	Convergence of the iterative estimate for bandset Low

Table 8.3.4-1: Coding of ANNOT\_BPAC flag

### 8.3.5 - Exception handling

To summarise exception handling in section 8.3.3 above:

1. When  $\rho_{rc} \leq 0$  at b705 or b865 in step 2.6.8.4 then go to step 2.6.8.8, set BPAC\_ON\_F(j,f) and CASE2\_S(j, f) to FALSE and ACFAIL\_F(j,f) to TRUE.
2. When the LOW band set is selected and the initial value of  $\rho_w(b705)$  in step 2.6.8.5 is below the MERIS threshold, then go to step 2.6.8.8, set BPAC\_ON\_F(j,f), CASE2\_S(j, f) and ACFAIL\_F(j,f) to FALSE,  $\rho_w(\{b705, b775, b865, b885\})$  to clear water values and SPM<sub>br</sub> to 0.
3. Iterative loop shall break when aerosol reflectances at 775nm or 865nm are negative or null in step 2.6.8.6.
4. Iterative loop shall break when water leaving reflectance at band b1 is negative in step 2.6.8.6.
5. When step 2.6.8.7 detects that none of the band set iterations is successful, then go to step 2.6.8.8, set BPAC\_ON\_F(j,f) and CASE2\_S(j, f) to FALSE,  $\rho_w(\{b705, b775, b865, b885\})$  to clear water values and SPM<sub>br</sub> to 0.

## 8.4 - Clear water atmospheric corrections (step 2.6.9)

### 8.4.1 - Overview

The objective of the clear water atmosphere correction is to identify and subtract from the TOA reflectances (corrected for stratospheric aerosols, gaseous absorption and Sun glint), the contribution of the atmosphere, which consists of molecular (Rayleigh) and particulate (aerosol) scattering and extinction. The correction is performed in order to provide normalised water-leaving reflectances.

A secondary objective is to estimate aerosol products: type and optical thickness.

The principle of the clear water atmosphere correction is to identify aerosol models which, together with a tabulated model of the molecular scattering and assumptions on the surface reflectance, fit the observed glint-corrected reflectance in the infra-red part of the spectrum (bands 775, 865nm) and in a visible band (510nm).

The assumptions for Case 1 waters are that reflectance is null at all wavelengths beyond 700nm, and that reflectance at 510nm is nearly constant.

The output of the turbid water atmosphere correction (step 2.6.10, see section 7.3.4.2 above) provides as input estimates of the water reflectance at the bands used by the algorithm.

The algorithm provides one or two aerosol models and their properties in the visible and NIR wavelength domain, which allow to perform a correction of the atmosphere contribution and compute water-leaving reflectances.

The water-leaving reflectances output by the atmosphere corrections above water are normalised in order to remove dependency of the signal upon atmosphere conditions. The normalised water-leaving reflectance product  $\rho'_w$  is defined as follows:

$$\rho'_w = \frac{\pi \cdot L_w}{E_d(0^+)}$$

where  $L_w$  is the water-leaving radiance and  $E_d(0^+)$  the down-welling irradiance.

The water-leaving reflectance is used by other sub-steps and provided to the Product formatting (step 2.10). This step is applied to all pixels where ACFAIL\_F is FALSE.

#### 8.4.1.1 - Path reflectance estimate (step 2.6.9.1)

When starting the atmospheric correction, we dispose of the (measured) total glint corrected reflectance ROGC, and of  $\rho_R(\lambda)$  for each wavelength. When turbid case 2 water has been detected by a previous step, we also have an estimate of the marine reflectance at TOA,  $\rho_{w\_C2}$ , otherwise this quantities is set to the reflectance of pure water.

Atmospheric corrections need an estimate of the contribution of the sky to the total reflectance, or path reflectance, at two wavelengths.

At 779 and 865 nm, for any water pixel, we subtract the water contribution so that

$$\rho_{\text{path}}(\lambda) = \text{ROGC}(\lambda) - \tau_{\text{w\_C2}}(\lambda)$$

The path reflectance is then corrected for pressure variation, in order to enter the aerosol model selection at standard pressure.

#### 8.4.1.2 – MERIS aerosol model (step 2.6.9.2)

When starting the aerosol correction, we dispose on one hand of the path reflectance  $\rho_{\text{path}}$  at two wavelengths, and of the TOA reflectance  $\text{ROGC}(\lambda)$  and Rayleigh reflectance  $\rho_{\text{R}}(\lambda)$  for each wavelength, and on the other hand of tabulated relationships linking the ratio  $\rho_{\text{path}}/\rho_{\text{R}}$  to the aerosol optical thickness  $\tau_{\text{a}}(\lambda)$ , for N aerosol models.

The central problem is the selection, among a set of aerosol models, of the two models that most closely bracket the actual aerosol. The principle is to rely on the look-up tables, which should allow :

- To calculate the values of  $\tau_{\text{a}}(865)$  from the  $\rho_{\text{path}}(865)/\rho_{\text{R}}(865)$  ratio, for several aerosol models,
- To extrapolate  $\tau_{\text{a}}$  from 865 to 775 nm, for each aerosol model,
- To obtain the  $(\rho_{\text{path}}(775) / \rho_{\text{R}}(775))$  ratios from  $\tau_{\text{a}}(775)$ , for each aerosol model. These ratios computed from aerosol model, will be noted  $\zeta(\lambda)$  in the following.
- To select a couple of aerosol models, by comparing the actual  $(\rho_{\text{path}}(775) / \rho_{\text{R}}(775))$  ratio, and the various  $\zeta(775)$  ratios as obtained at the previous step.
- To estimate the  $\zeta(\lambda)$  ratio in the visible bands from the knowledge of the spectral behaviour of this couple of aerosol models.

The successive steps of such a correction scheme are as follows. For a given pixel, and thus for a given geometry ( $\theta_{\text{S}}$ ,  $\theta_{\text{V}}$ ,  $\Delta\phi$ ):

- (1) The ratio  $\rho_{\text{path}}(\lambda) / \rho_{\text{R}}(\lambda)$  is computed at 865 and 775 nm,  $\rho_{\text{R}}(\lambda)$  being taken in tabulated values.
- (2) A first set of N aerosol models is selected, which, in principle, is representative of clear oceanic atmospheres. For these N aerosol models, N  $\tau_{\text{a}}(865)$  values are calculated from the  $(\rho_{\text{path}}(865) / \rho_{\text{R}}(865))$  ratio.
- (3) N values of  $\tau_{\text{a}}(775)$  are computed for the N aerosol models, from the knowledge of their spectral optical thicknesses (normalised by their values at 865 nm; tabulated values).
- (4) N values of  $\zeta(775)$  are computed from the N values of  $\tau_{\text{a}}(775)$  for the N aerosol models, from the tabulated relationships between both quantities.

- (5) The actual ( $\rho_{\text{path}}(775) / \rho_{\text{R}}(775)$ ) is then compared to the N individual values of  $\zeta(775)$  obtained at step (4), and the 2 that most closely bracket the actual one indicate the two candidate aerosol models.
- (6) 2 values of  $\tau_a(\lambda)$  are calculated for bands at 510 nm and 705 nm from the normalised spectral optical thicknesses of the 2 “bracketing” aerosol models. Step (2) is now inverted, to calculate two  $\zeta(\lambda)$  ratios from the two  $\tau_a(\lambda)$  at 510 nm and 705 nm.
- (7) The following step lies on the assumption that the actual ( $\rho_{\text{path}}(\lambda) / \rho_{\text{R}}(\lambda)$ ) ratio falls between the two  $\zeta(\lambda)$  ratios calculated at step (6), proportionally, in the same manner as it does at 775 nm.  $\rho_{\text{path}}(\lambda)$  is now estimated for bands at 510 nm and 705 nm.
- (8) By making an assumption on the normalised water-leaving reflectance at 510 nm, the error in the atmospheric correction at 510 nm,  $\Delta\rho_{510}$ , can be assessed.
- (9) A test is then made on this  $\Delta\rho_{510}$  value, if a number of conditions are met. If those conditions are not met, the correction is continued at step (10). Otherwise, depending on the test result, either the correction is continued at step (10), or it is carried out once more from step (2), by selecting however a different set of N’ aerosol models. In the latter situation, the correction is actually carried out for several aerosol databases, so that steps 2-8 are carried out several times; several couples of aerosol models are then selected (one at each time steps 2-8 are done), and the one which is retained at the end is the one that leads to the lowest  $\Delta\rho_{510}$ .
- (10) For every wavelength  $\lambda$  of the visible domain, 2 values of  $\tau_a$  are calculated from the knowledge of the spectral scattering coefficients of the 2 “bracketing” aerosol models.
- (11) Step (2) is now inverted, to calculate two  $\zeta(\lambda)$  ratios from the two  $\tau_a(\lambda)$  for the visible bands, and then to obtain  $\rho_{\text{path}}(\lambda)$  (see step 7).

#### 8.4.1.3 – Correction (step 2.6.9.3)

At the end of the MERIS model step, we now have an estimate of the path reflectance and aerosol optical parameters at all visible and NIR wavelengths where the atmospheric correction is required.

The water-leaving reflectance at the instrument level is then obtained as:

$$t_u(\lambda) \cdot t_d(\lambda) \cdot \rho'_w(\lambda) = \text{ROGC}(\lambda) - \rho_{\text{path}}^*(\lambda)$$

Note that we now impose  $t_u(\lambda) \cdot t_d(\lambda) \cdot \rho'_w(\lambda) = t_{pw\_C2}(\lambda)$  at  $\lambda=779$  and  $865$  nm, as it should theoretically be but cannot numerically because of the pressure correction, and at  $885$  nm as well where the signal is too small and might produce negative value.

The following step consists in calculating the diffuse transmittance, downward  $t_d(\lambda)$  and upward  $t_u(\lambda)$ , in order to retrieve the normalised water-leaving reflectance at surface level  $\rho'_w(\lambda)$ .

## 8.4.2 - List of variables

An exhaustive list of variables is provided with each step /subroutine /function detailed specification in 8.4.3 below. The table below summarises the inputs, outputs of the main algorithm and auxiliary parameters of all steps /subroutines /functions.

The index entries of the LUTs described within the table below are included in the auxiliary file containing the LUTs, see AD4 for details.

The nominal wavelengths are listed in table 2.4-1. It should be noted that, in all the following tables and equations, the shorthand notation b412..**b885** excludes band 11 (760 nm).

In all following sections of §8.4,  $\mu_s$ ,  $\mu_v$  and  $\mu$  are respectively equivalent to  $\cos(\theta_s)$ ,  $\cos(\theta_v)$  and  $\cos(\theta_v)$  - they may be computed at the main level or within each function.

Note that the aerosol single scattering albedo and ratio of forward to total scattering are not used anymore for transmittance estimates, but still computed and stored into breakpoints.

Symbol	Descriptive name	T	U	Range /Remarks
INVALID_F (j, f)	Invalid pixel flag	i	-	Boolean, from 2.1a (§3.4)
CLOUD_F (j, f)	Cloud flag	i	-	from step 2.1c (§5.4)

## 8.4.3 - Detailed Algorithm Specification

NOTE: For the sake of clarity, the subscripts (j,f) of parameters related to one pixel may be omitted when unambiguous, e.g.  $\theta_s$  is equivalent to  $\theta_s(j, f)$ .

### 8.4.3.1 - Atmosphere corrections (step 2.6.9)

#### 8.4.3.1.1 - Functional description

The functional block diagram in figure 8.4.3.1.1–1 below shows the operation and parameters of the Atmosphere corrections.

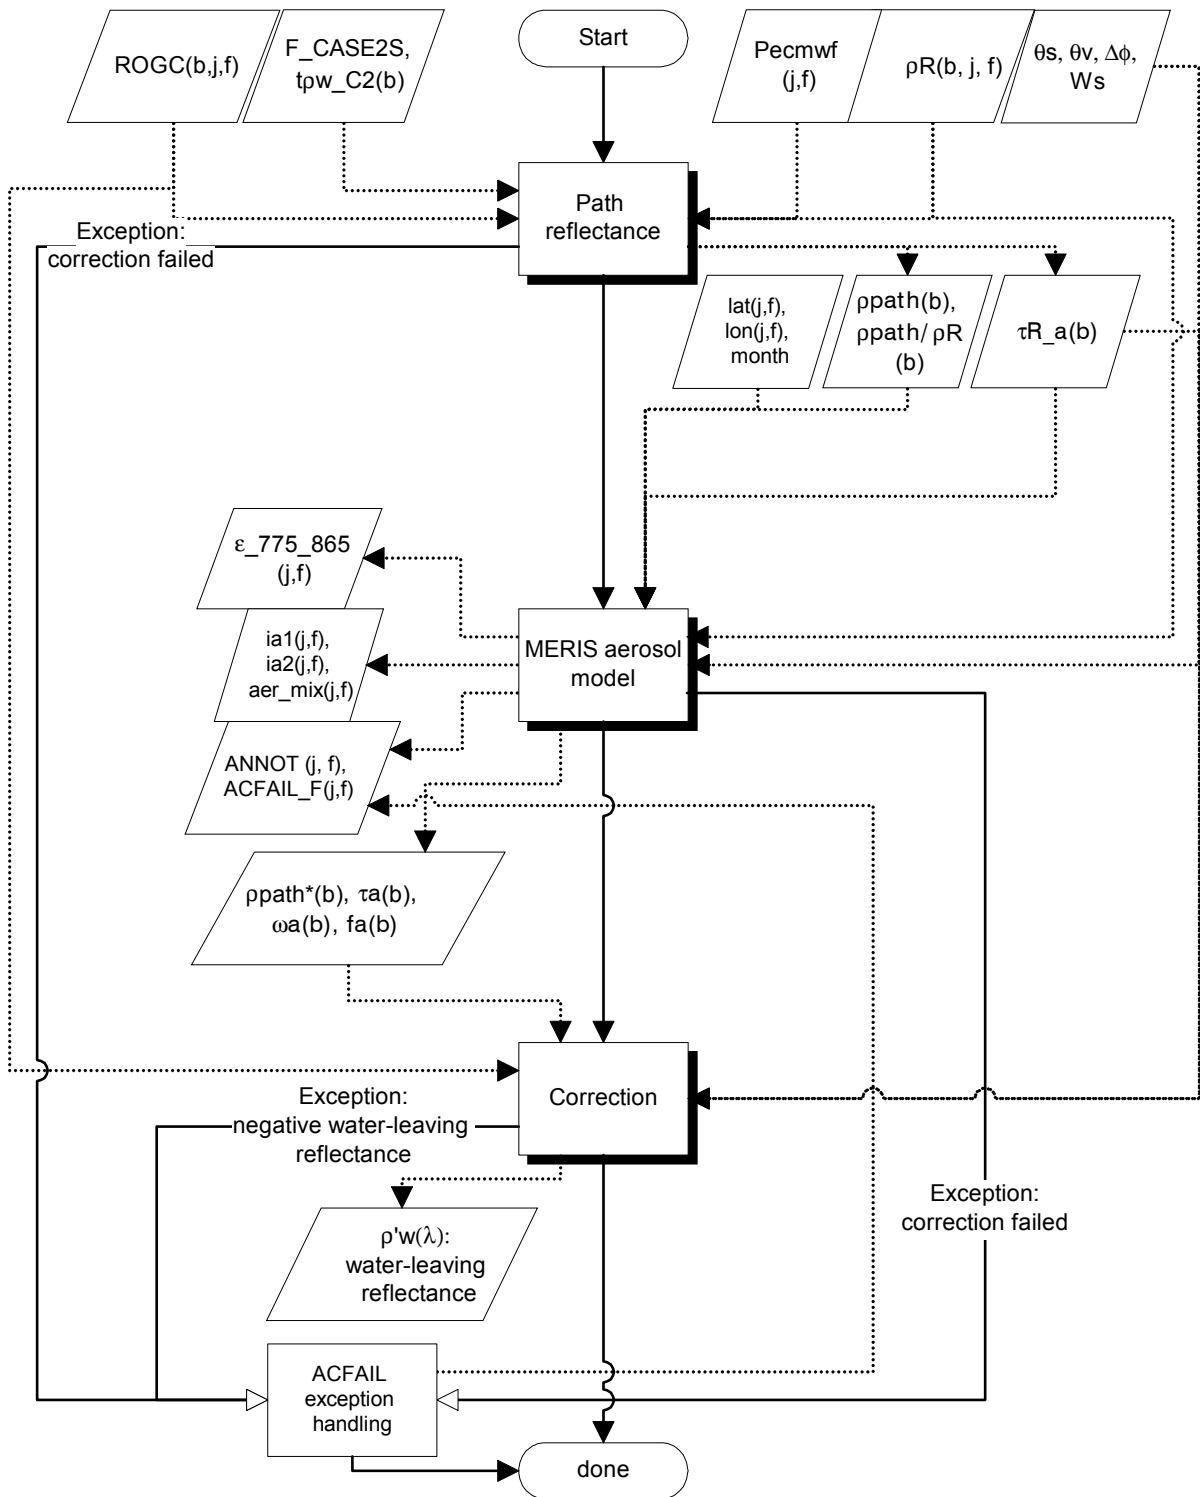

Figure 8.4.3.1.1-1: functional block diagram of Atmospheric corrections (step 2.6.9)

### Notes

- 1) for the sake of clarity, step numbers are omitted from the figure above.
- 2) Process initialisation (step 2.6.9.0) is not represented in the figure above.

### 8.4.3.1.2 - Inputs /Outputs

Symbol	Descriptive name	T	U	Range /Remarks
INVALID_F (j, f)	Invalid pixel flag	i	-	Boolean
CLOUD_F (j, f)	Cloud flag	i	-	<i>idem</i>

*Table 8.4.3.3.2-1: Parameters for the Path reflectance step*

### 8.4.3.3.3 - Algorithm

ANNOT(j, f) = 0 (2.6.9.1-1)

**If** ( z (j,f) > DEPTH\_LIM ) **then** (2.6.9.1-2)

    set bit SHALLOW of ANNOT(j,f)

**Endif**

**For each** b in b412..b865

    Correct Rayleigh reflectance for pressure variations  
    (moved to section 8.3.3.2) (2.6.9.1-3)

    Correct Rayleigh optical thickness for pressure variations  
    (moved to section 8.3.3.2) (2.6.9.1-4)

**Endfor**

Estimate  $\rho_{path}$ ;  $\rho_{path}$  is representative of the “ reflectance above clear water ”. At bands 775 and 865 it does include the water-leaving reflectance due to sediment.

Note: it is useless to extend the computation to 885 nm, since this band does not help computing the atmospheric path reflectance.

**For each** b in {b510, b775, b865}

**If** b == b510 **then**

$\rho_{path}(b) = ROGC(b,j,f)$  (2.6.9.1-5)

**Else**

$\rho_{path}(b) = ROGC(b,j,f) - tpw\_C2(b,j,f)$  (2.6.9.1-6)

**Endif**

**exception processing: when** ( $\rho_{path}(b) \leq \rho_{R0}(b)$  **AND** b in {b775, b865})

    ACFAIL\_F(j,f) = TRUE

    process pixel according to "Exception: atmosphere correction failed" (§8.4.5)

**end of exception processing**

**If** (**abs**( $P_{ECMWF}(j,f) - P_{std}$ ) > PRESS\_TOLERANCE) **then**

$\rho_{path}(b) = correct\_AP(\rho_{path}(b), P_{std}, P_{ECMWF}(j, f), b, \tau_{ua}(b), MINUS)$  (2.6.9.1-8)

The function *correct\_Δp* is defined in 8.4.3.13.7 below.

**Endif**

Form the ratio of the path reflectance upon Rayleigh reflectance

Note : the values of  $\rho_R$  used in the equations below ARE NOT corrected for pressure variations

$\rho_{path\ upon\ \rho_R}(b) = \rho_{path}(b) / \rho_R(b, j, f)$  (2.6.9.1-9)

**Endfor**

## 8.4.3.4 – MERIS aerosol model (step 2.6.9.2)

### 8.4.3.4.1 - Functional description

This step is the core of the atmospheric correction above water for MERIS: it computes aerosol parameters for atmospheric correction taking full advantage of the MERIS spectral range and accuracy. Due to its complexity, it is further broken down in sub-steps; each sub-step is specified in a separate section below. The operation and parameters of the Aerosol model step are shown in figures 8.4.3.4.1-1 and 8.4.3.4.1-2 below.

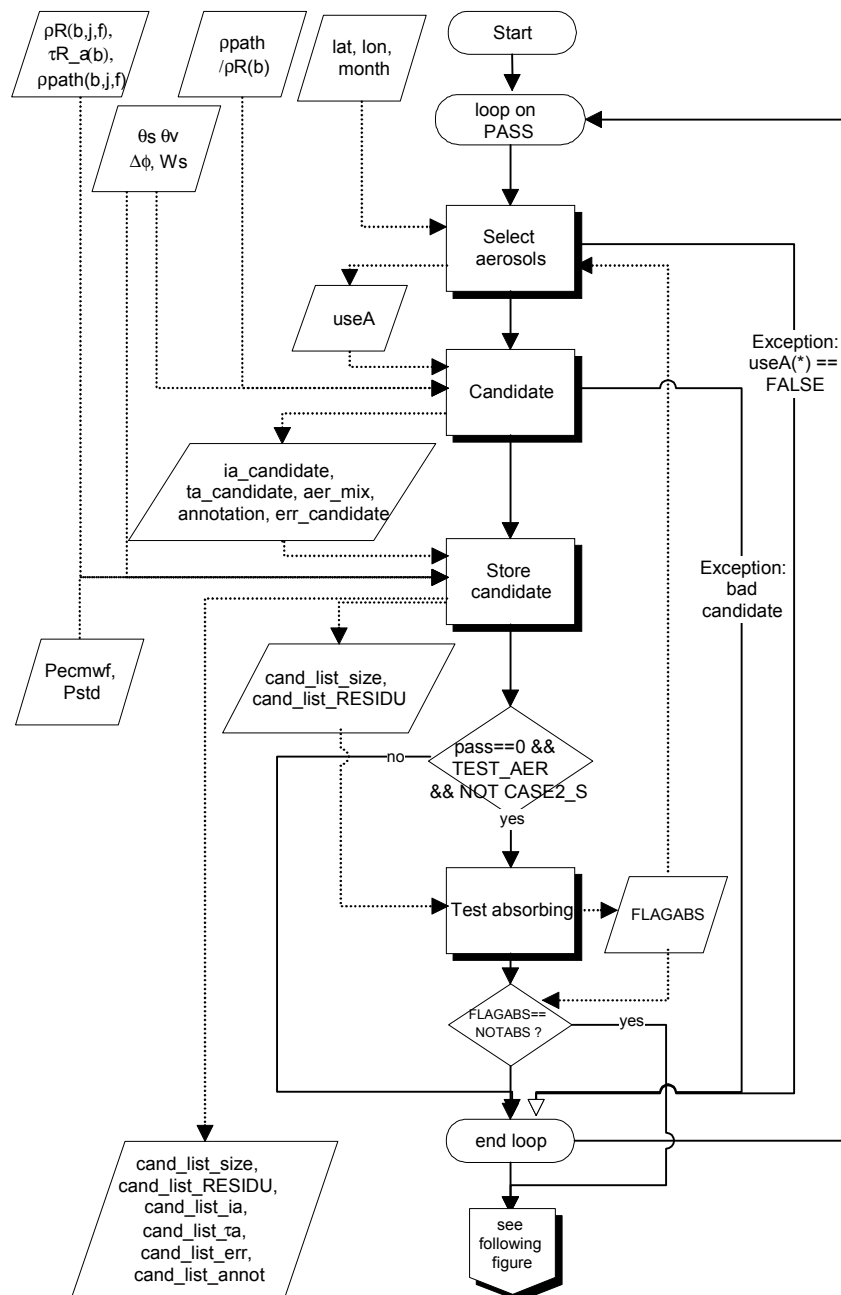

Figure 8.4.3.4.1-1: functional block diagram of MERIS aerosol model (step 2.6.9.2), part 1

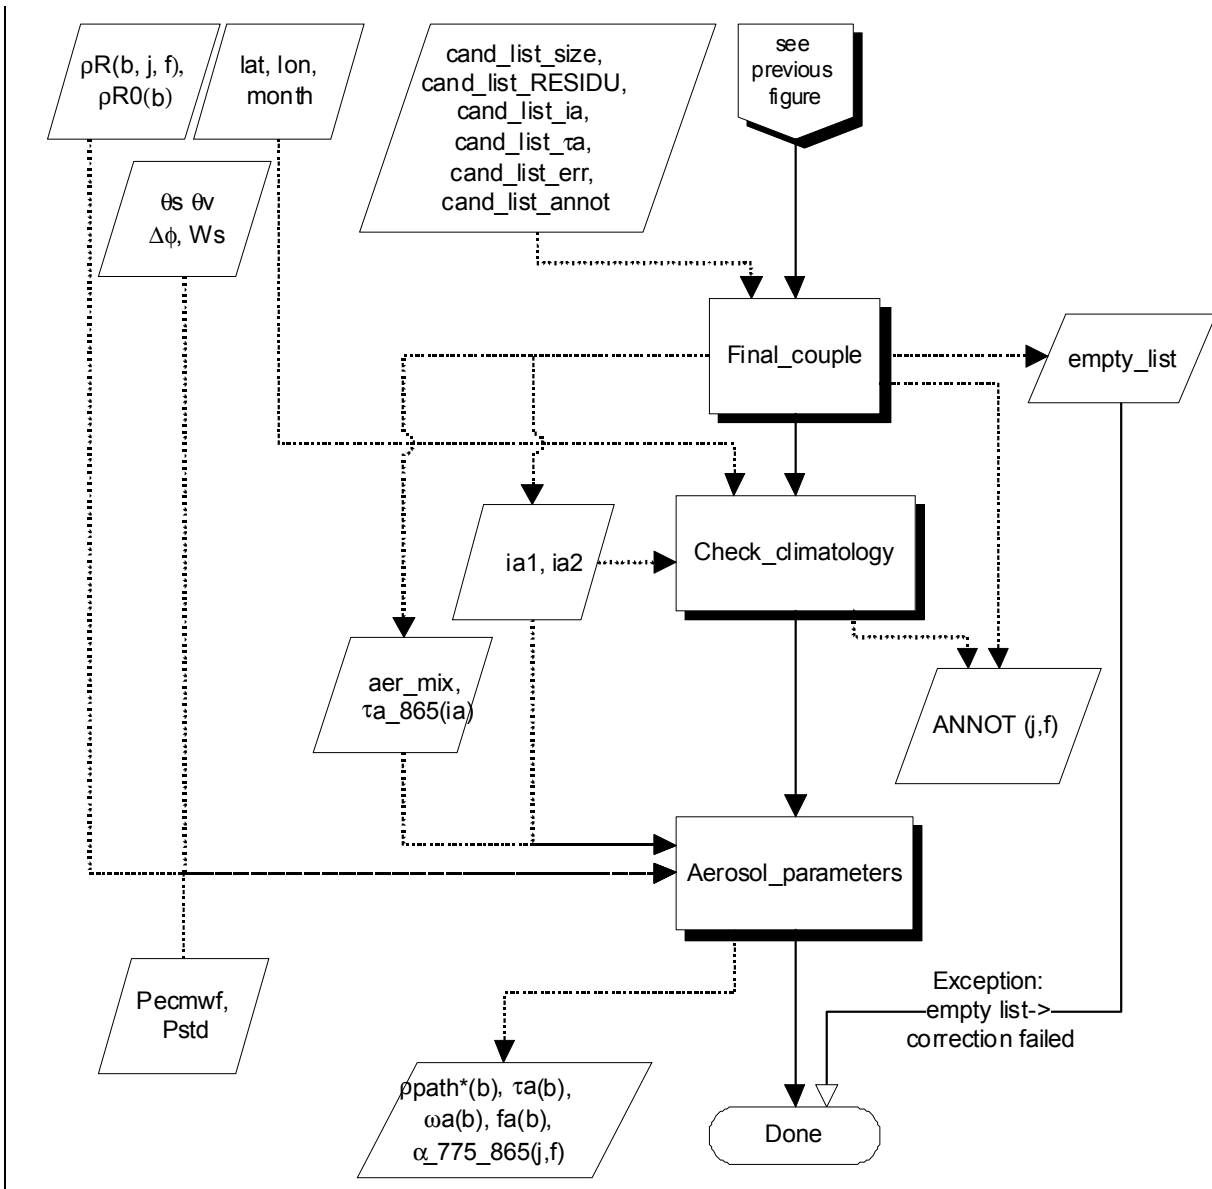

Figure 8.4.3.4.1-2: functional block diagram of MERIS aerosol model (step 2.6.9.2), part 2  
 Note: for the sake of clarity, step numbers are missing from the figures above. The correspondence between step identifier and number is found in §8.4.3.4.3 below.

PRE_DUST	switch enabling desert dust aerosol assemblages	c	-	Boolean
useA(ia)	flag indicating if an aerosol model is used by the atmosphere corrections	o	-	Boolean, ia: 1..N_Aer

*Table 8.4.3.5.2-1: List of parameters for step Select Aerosols*

Each element of Aerclim\_Ocean\_LUT is an array of 8 Boolean parameters, stored in one byte as follows (bit numbering follows the convention in AD5):

Description	Bit no	Used in
Switch enabling the use of generic aerosol models	0	Select Aerosols
<i>not used</i>	1	N/A
Switch enabling the use of “blue” aerosol assemblages	2	Select Aerosols
Switch enabling the use of desert dust-like aerosol assemblages	3	<i>idem</i>
Switch validating the detection of generic aerosol models	4	Check climatology
<i>not used</i>	5	N/A
Switch validating the detection of “blue” aerosol assemblages	6	Check climatology
Switch validating the detection of desert dust-like aerosol assemblages	7	<i>idem</i>

### 8.4.3.7 - Store candidate models (step 2.6.9.2.3)

#### 8.4.3.7.1 – Functional Description

This algorithm step stores a pair of aerosol models, with meaningful parameters, into a list from which an optimal candidate pair will be selected by a further step. The list is implemented as a counter `cand_list_size` and arrays `cand_list_mix`, `cand_list_ia`, `cand_list_τa`, `cand_list_RESIDU`, `cand_list_err`, `cand_list_annot`. Its operation and parameters are shown in figure 8.4.3.7.1-1 below.

**8.4.3.13.5 - Function transmittance\_up (ia1, ia2, b,  $\tau_{R0}$ ,  $\tau_{a\_865(i)}$ , aer\_mix,  $\mu$ )**

This function computes the diffuse transmittance on the surface-sensor path. It is called by *Correction* (step 2.6.9.4) and by function *Denormaliser*.

**8.4.3.13.5.1 - Input/Output**

Variable	Descriptive name	T	U	Range – References
ia1, ia2	Index of bracketing aerosol models	i	-	
b	band index	i	nm	
$\tau_{R0}$	Rayleigh optical thicknes corrected for actual pressure at band b	i	dl	from step 2.1.c (§5.5)
$\tau_{a\_865(i)}$	Aerosol optical thickness for the two aerosol candidates at 865 nm	i	dl	i:{LOW, HIGH}
aer_mix	Aerosol mixing ratio	i	dl	
$\mu$	Cosine of view zenith angle	i	dl	
$\tau_R(b)$	Rayleigh optical thickness at standard pressure at band b	s	dl	
$t_{up\_LUT}$ [ia, b, $\mu$ , $\tau_{a\_865}$ ]	LUT for upward diffuse transmittance	s	dl	
$\tau_{a\_bl865}(aer, \tau)$	LUT of the optical thickness of the aerosol assemblage at 865 nm	s	dl	
log_tup1	Diffuse transmittance on surface-sensor path for aerosol model ia1	c	dl	
log_tup2	Diffuse transmittance on surface-sensor path for aerosol model ia2	c	dl	
tup	Diffuse transmittance on surface-sensor path	o	dl	

Table 8.4.3.13.5.1-1: List of variables for function transmittance\_up

**8.4.3.13.5.2 - Algorithm**

Compute upward transmittance for the two aerosol models:  
 $\log\_tup1 = t_{up\_LUT} \text{ interpol}:(\mu, \tau_{a\_865}(\text{LOW})) \text{ select}:(ia1, b)$  (tup-1)  
 $\log\_tup2 = t_{up\_LUT} \text{ interpol}:(\mu, \tau_{a\_865}(\text{HIGH})) \text{ select}:(ia2, b)$  (tup-2)

**warning:** in (tup-1) and (tup-2), the interpolation along the  $\tau_a$  dimension depends on the aerosol model. Thus the interpolation indices and weight of  $\tau_a$  must be taken from the interpolation of  $\tau_a$  in LUT  $\tau_{a\_bl865}(aer, *)$ , with aer selected as the current candidate model.  
**warning 2:** the interpolation must be done on the log of  $t_{up\_LUT}$  values.

Interpolate the transmittance in logscale between aerosol models and correct for pressure the Rayleigh contribution:

**8.4.3.13.10 - Function transmittance\_d(ia1, ia2, b,  $\tau_{R0}$ ,  $\tau_a_{865}(i)$ , aer\_mix,  $\mu_s$ ,  $W_s$ )**

The function *transmittance\_d* computes the transmittance on the Sun-pixel path for optical properties computed at a given band. It is called by Correction (step 2.6.9.4) and by function *denormaliser*.

**8.4.3.13.10.1- Input /Output**

Variable	Descriptive name	T	U	Range – References
ia1, ia2	Index of bracketing aerosol models	i	-	
b	band index	i	nm	
$\tau_{R0}$	Rayleigh optical thickness corrected for actual pressure at band b	i	dl	from step 2.1.c (§5.5)
$\tau_a_{865}(i)$	Aerosol optical thickness at 865nm	i	dl	i: {LOW, HIGH}
aer_mix	Aerosol mixing ratio	i	dl	
$\mu_s$	Cosine of Sun zenith angle	i	dl	
$W_s$	Wind speed modulus	i	m/s	
$\tau_R(b)$	Rayleigh optical thickness at standard pressure at band b	s	dl	
$t_{down\_LUT}$ [ia,b, $\mu_s$ , $\tau_a_{865}$ , $W_s$ ]	LUT for downward diffuse transmittance	s	dl	
$\tau_a_{bl865}(aer, \tau)$	LUT of the optical thickness of the aerosol assemblage at 865 nm	s	dl	
log_ $t_{down1}$	Log of diffuse transmittance on sun-surface path for aerosol model ia1	c	dl	
log_ $t_{down2}$	Log of diffuse transmittance on sun-surface path for aerosol model ia2	c	dl	
$t_{down}$	Diffuse transmittance on sun-surface path	o	dl	

Table 8.4.1.1.1-1: List of variables for function *transmittance\_d*

**8.4.3.13.10.2- Algorithm**

Compute downward transmittance for aerosol model ia1 and ia2:

$$\log\_t_{down1} = t_{down\_LUT} \text{ interpol}:(\mu_s, \tau_a_{865}(\text{LOW}), W_s) \text{ select}:(ia1, b) \quad (td-1)$$

$$\log\_t_{down2} = t_{down\_LUT} \text{ interpol}:(\mu_s, \tau_a_{865}(\text{HIGH}), W_s) \text{ select}:(ia2, b) \quad (td-2)$$

**warning:** in (td-1) and (td-2), the interpolation along the  $\tau_a$  dimension depends on the aerosol model. Thus the interpolation indices and weight of  $\tau_a$  must be taken from the interpolation of  $\tau_a$  in LUT  $\tau_a_{bl865}(aer, *)$ , with aer selected as the current candidate model.

**warning 2:** the interpolation must be done on the log of  $t_{down\_LUT}$  values.

Interpolate the transmittance in logscale between aerosol models and correct for pressure the Rayleigh contribution:

# MERIS ESL

**Page** : 8-92

$$t_{up} = \exp[\log_{t_{down1}} * (1 - aer\_mix) + \log_{t_{down2}} * aer\_mix] \cdot \frac{\exp\left(-\frac{\tau_{R0}}{2\mu_s}\right)}{\exp\left(-\frac{\tau_R(b)}{2\mu_s}\right)} \quad (td-3)$$

**Return**  $t_{down}$

#### 8.4.4 Quality control and diagnostics

The annotation flag has been introduced within the atmospheric correction scheme, to provide the breakpoints with indications about the course of the algorithm. This flag (variable “ANNOT”) is represented by 2 bytes. Each bit implements a Boolean flag, corresponding to various, non necessarily exclusive, situations, for which the accuracy of the algorithm can be degraded :

symbol	bit pos.	Meaning
SHALLO W	0	The altitude is above DEPTH_LIM
ORLUT	1	LUT index variables out of range
EPSILON	2	The aerosol Angström exponent cannot be computed
AERO_B	3	Blue aerosols
ABSO_D	4	Desert dust absorbing aerosols
ACLIM	6	The aerosol model does not match the climatology of aerosols
ABSOA	7	Absorbing aerosols
MIXR1	8	The aerosol mixing ratio is equal to 1
DROUT	12	The minimum absolute value of $\Delta\rho_{510}$ is greater than DRO510_threshold
TAU06	10	The aerosol optical thickness is greater than TAU560_threshold

Table 8.4.4-1: Coding of ANNOT flag

An array of flags, RWNEG, provides a “negative water-leaving reflectance” flags for each band. It is implemented as a 16-bit word, with bit number corresponding to (band index – 1).

#### 8.4.5 - Exception handling

The equations below specify the handling of the exception: “atmosphere correction failed”:

$$ia1(j, f) = \text{BAD\_VALUE}$$

$$ia2(j, f) = \text{BAD\_VALUE}$$

$$\tau_{a865}(j, f) = \text{BAD\_VALUE}$$

$$\alpha_{775\_865}(j, f) = \text{BAD\_VALUE}$$

**For** b in {b412..b865}

$$\rho'_w(b, j, f) = \text{BAD\_VALUE}$$

$$\tau_a(b, j, f) = \text{BAD\_VALUE}$$

**Endfor**

end of exception processing

Other exceptions: see blocks "exception processing... end of exception processing" in 8.4.3 above.

## 8.5 - MERIS Ocean Colour Processing (step 2.9)

### 8.5.1- Introduction

This chapter describes the processing to be applied to surface reflectances produced by the atmospheric corrections above water (§8.4 above) in order to derive ocean bio-optical parameters (RD 8, §2.5, §2.8, §2.9, §2.10, §2.11, §2.12).

### 8.5.2- Algorithm Overview

Different algorithms are used as shown in flow chart 8.5.2-1.

- I. A band-ratio algorithm **optimised** for open ocean clear waters (so-called "Case 1") yields a geophysical quantity :
  - Algal Pigment Index 1
- II. **Robust** band-ratio algorithms valid for all water types, including yellow substance dominated (so-called Case 2 (y)) and waters with excessive back-scattering. These algorithms yield the following Product Confidence Data :
  - flag for anomalous scattering waters
  - flag for yellow substance-dominated waters
- III. An algorithm to estimate the instantaneous value of the Photosynthetically Available Radiation (PAR)

Three different flags indicating the type of water sensed are used as they have an influence on processing quality:

- turbid waters (described in Section 7 of this document)
- yellow substance dominated waters
- anomalous scattering

Furthermore, range checks on input and output parameters are applied for quality control.

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name** : MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 8-96

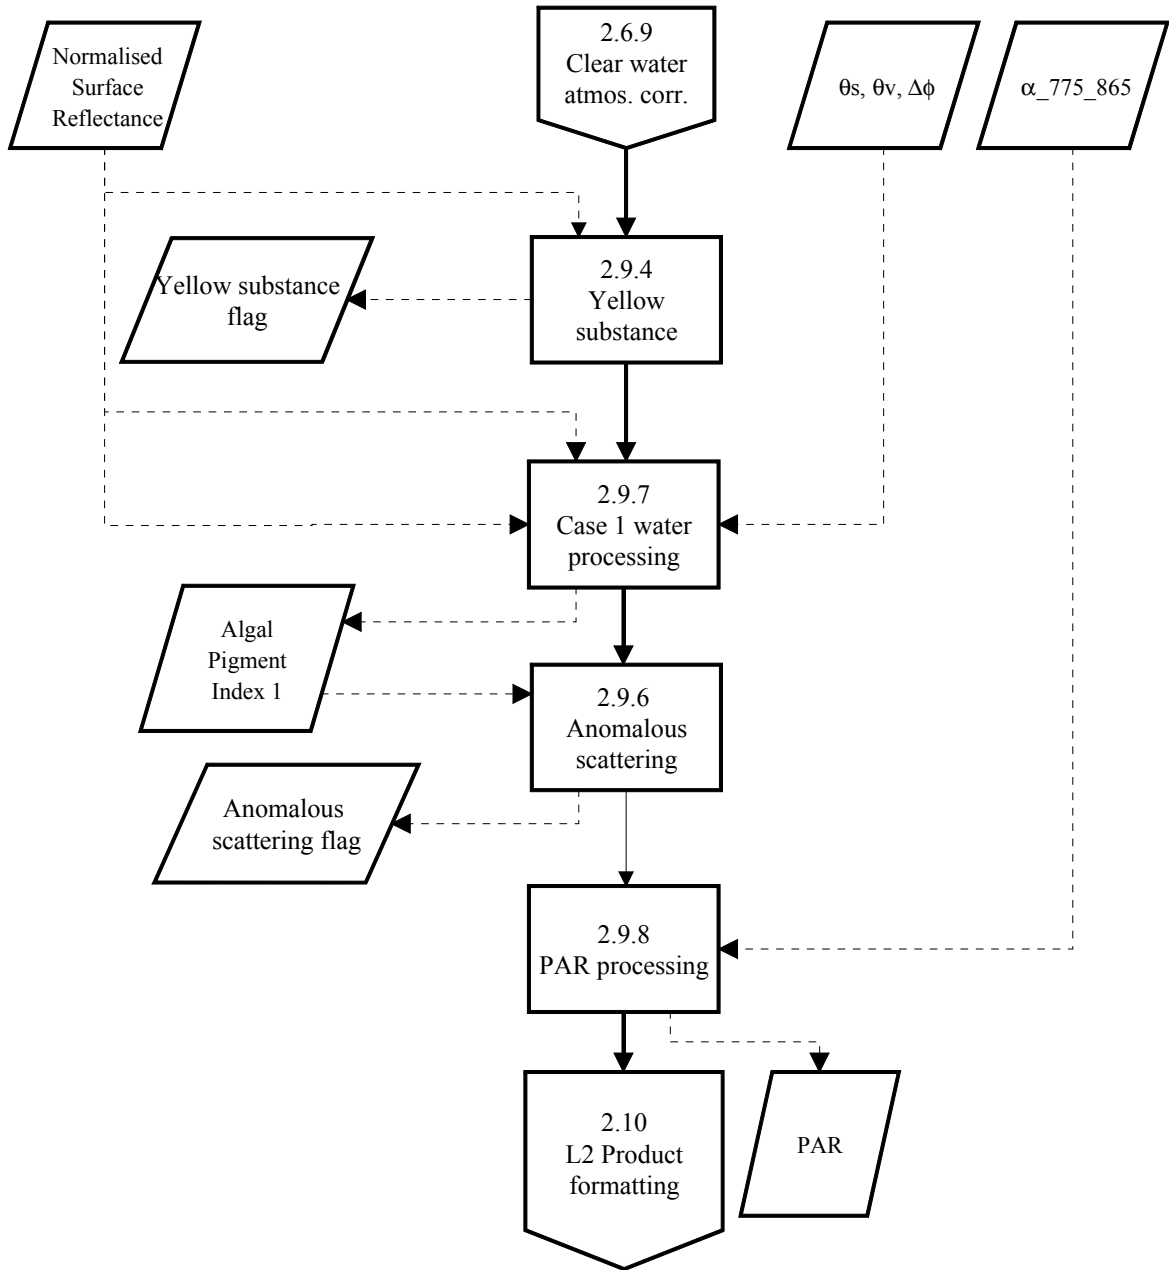

Figure 8.5.2-1 : MERIS ocean colour processing (step 2.9) functional breakdown

### **8.5.3- Mathematical Description of Algorithm (step 2.9)**

#### **8.5.3.1 - Case 2 (Yellow substance dominated) flag (step 2.9.4)**

The presence of Case 2 water is flagged by Yellow substance (CASE2Y\_F) flag (step 2.9.4). Input data are normalised water-leaving reflectance  $\rho'_w(b, j, f)$ . A LUT technique is applied for the retrieval. The procedure is described in RD8 (2.8).

#### **8.5.3.2 - Case 1 waters processing - Algal pigment index 1 (Chl1) retrieval (step 2.9.7)**

Case 1 waters processing is based on a band ratio algorithm. Inputs are normalised water-leaving reflectance  $\rho'_w(b, j, f)$  and ancillary data. The theory of data processing is described in RD8 (2.9). Processing is performed in two steps:

1. a band ratio estimate of Chl1 is selected among up to three possible ones, according to ratio value
2. an iterative procedure eliminates the influence of bi-directionality (parameters  $f_{\text{over\_q1}}$  and  $f_0$ ) on Chl1 estimate.

#### **8.5.3.3 - Case 2 anomalous scattering water flags (step 2.9.6)**

The presence of Case 2 water is flagged by the Anomalous scattering (CASE2ANOM\_F) flag (step 2.9.6). Input data are normalised water-leaving reflectance  $\rho'_w(b, j, f)$  and algal pigment index 1. A LUT technique is applied for the retrieval. The procedure is described in RD8 (2.8).

#### **8.5.3.4 - Deleted**

Case2 IMT products have been moved to section 8.6

#### **8.5.3.5 - Photosynthetically Available Radiation (step 2.9.8)**

Instantaneous Photosynthetically Available Radiation (PAR) is derived from the irradiance above each water pixels, under a tabulated relationship. The algorithm is RD 8, 2.18. This step is applied to all pixels where ACFAIL\_F(j, f) is FALSE.

## 8.6 - MERIS Case2R Ocean Colour Processing (step 2.9)

### 8.6.1- Introduction

This chapter describes the processing to be applied to TOA reflectance corrected for gas absorption and smile effect (§5 above) in order to derive ocean bio-optical parameters in coastal waters (RD11). This processing is totally independent from the Case 1 atmospheric correction (§8.4) and Case 1 water processing (§8.5) and can be seen as a parallel branch, specifically designed for Case2 waters but applied everywhere.

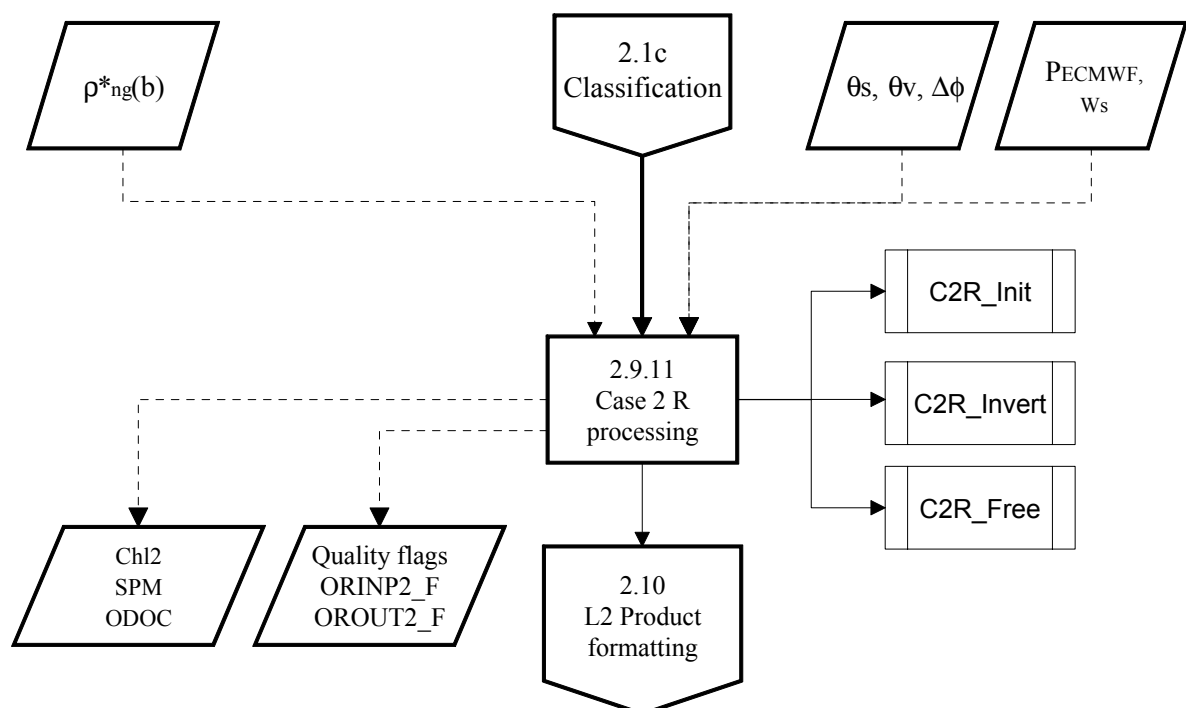

### 8.6.2- Algorithm Overview

The Case2R algorithm is originally a sequence of two Inverse Modelling Techniques (see RD11): first a backward Neural Network for atmospheric correction of the TOA signal, then a backward Neural Network for retrieval of marine constituents from water-leaving reflectance. Two other forward networks are also used for determining out of range inputs or outputs.

In order to simplify the C2R implementation, a CFI software has been developed, which includes all Neural Networks coefficients, calling routines and pre- and post-processing. It is applied to all atmospheric and water types and yields water inherent optical properties in turn converted into the following geophysical quantities:

- Algal Pigment Index 2 ( $\text{mg.m}^{-3}$ )
- Yellow substance absorption ( $\text{m}^{-1}$ )
- Sediment load (total suspended matter,  $\text{g.m}^{-3}$ )

The C2R CFI software produces also two quality control flags.

**Page** : 8-111

## 8.6.3- Mathematical Description of Algorithm (step 2.9.12)

Implementation of the Case2R through a CFI software implies a minimalist mathematical description. The software starts from geometrical angles, pressure and wind speed, TOA signal corrected for gas and smile effect and returns marine inherent optical properties in logscale, to be converted into Chl2 concentration, ODOC absorption, SPM concentration, as well as two confidence flags.

The multiple non-linear regression method included in this approach leads to high reduction in computing time and is therefore fast enough for operational mass production of Level 2 products, but it requires a careful and elaborate determination of the multiple coefficients (training phase).

## Endfor

### Case2R release

call C2R\_Free routine (see AD7) (2.9.12-18)

input: none

return value: none

## 8.6.6- Quality Control and Diagnostics

The flag ORINP2\_F provides confidence for the Inverse Model Technique algorithm included in step 2.9.12. It is based on a comparison (Chi-square difference) between the input radiance reflectance of the backward Neural Nets and reflectance reconstructed by the forward Neural Nets from the retrieved parameters.

The flag OROUT2\_F checks that output marine concentrations are within the training range of the Inverse Model Technique algorithm included in step 2.9.12.

## 8.6.7- Exception Handling

**For all non water pixels (see beginning of section 8.6.5.2) and in case Case2R initialisation fails, pixels where processing failed:**

$Chl2(j,f) = BAD\_VALUE$

$SPM(j,f) = BAD\_VALUE$

$ODOC(j, f) = BAD\_VALUE$

$ORINP2\_F (j, f) = TRUE$

$OROUT2\_F (j, f) = TRUE$

## 9. MERIS Land Pixels Processing

### 9.1 - Overview

This chapter describes the algorithms to be applied to the MERIS Top Of Atmosphere reflectance in order to compute the MERIS land level 2 products:

a) quantitative

- Top Of Atmosphere Vegetation Index (TOAVI);
- Top of Aerosols reflectance in bands 412 to 885nm;
- Aerosol optical thickness and alpha above DDV
- Bottom Of Atmosphere Vegetation Index (BOAVI);

b) qualitative

- Dense Dark Vegetation (DDV) flag;

as well as flags relevant to the quality of all products.

The block diagram in figure 9.1-1 below shows the general logic of the main processing steps. These steps are detailed in sections 9.2 to 9.4 below.

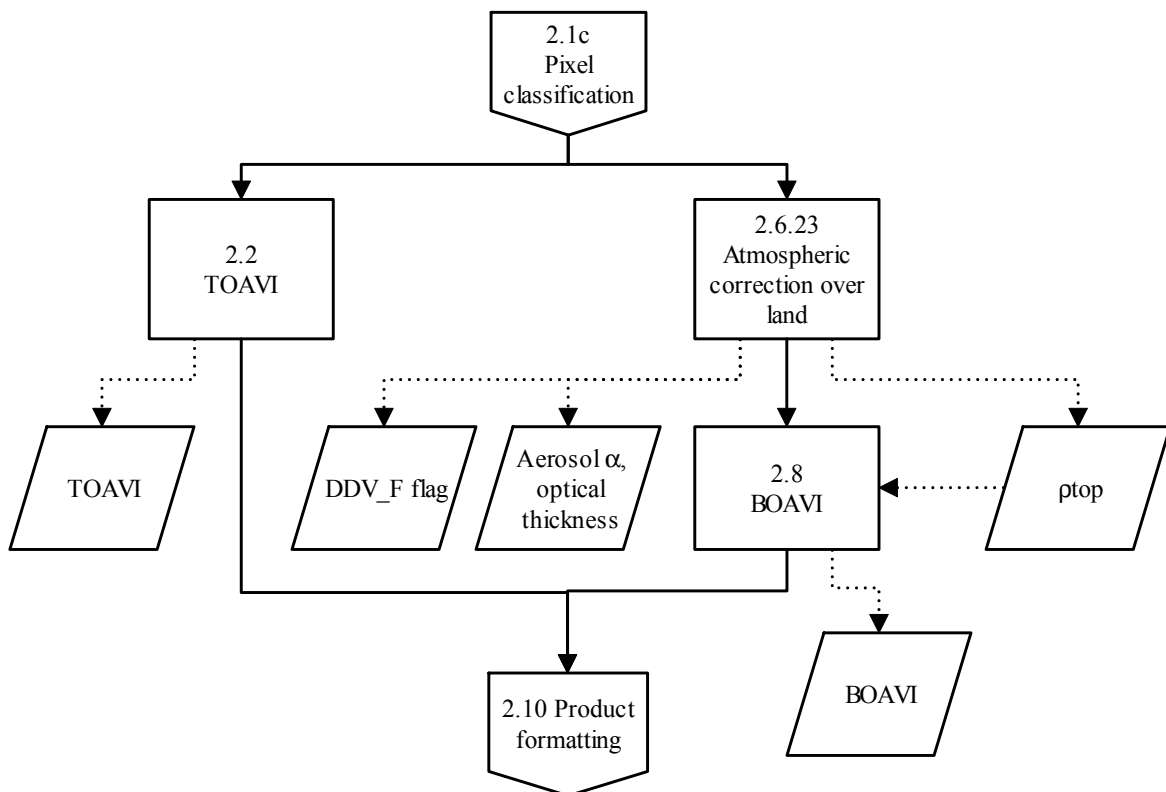

Figure 9.1-1: Land processing block diagram

## 9.2. - MERIS Top Of Atmosphere Vegetation Index (TOAVI) (step 2.2)

### 9.2.1. -Mathematical Description Of Algorithm

The diagram in figure 9.2.1-1 shows the logic of the TOA Vegetation Index computation. The algorithm takes as input the Top Of Atmosphere Reflectance output by step 2.1 .

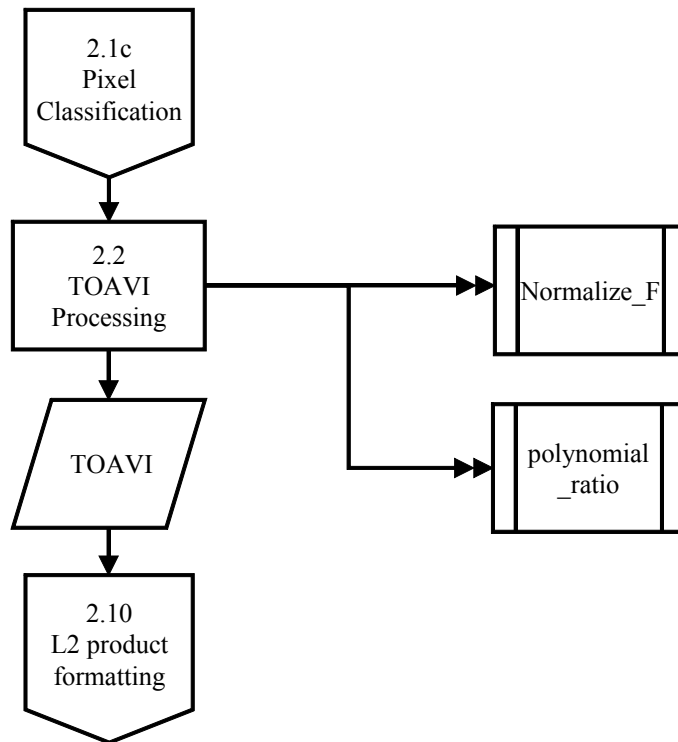

Figure 9.2.1-1 : MERIS Level 2 TOAVI computation

Before computing TOAVI, a spectral test is done on every Land pixels in order flagged any pixels that are not vegetated. Then, on the vegetated pixels, TOAVI or MERIS Global Vegetation Index (MGVI) is estimated in two steps. First, the information contained in the blue band at 442 nm is combined with that in the bands at 681 and 865 nm traditionally used to monitor vegetation, in order to generate "rectified channels" at these latter two wavelengths. The "rectification" is done in such a way as to minimise the difference between those rectified channels and the spectral reflectances that would be measured at the top of the canopy under a standard geometry of illumination and observation. The proposed algorithm assumes that ratios of polynomials are appropriate to generate both the "rectified channels" and the final spectral index, MGVI.

The MGVI has been optimised to assess the presence on the ground of healthy live green vegetation. The optimisation procedure has been constrained to provide an estimate of the Fraction of Absorbed Photosynthetically Active Radiation (FAPAR) in the plant canopy, although the index is expected to be used in a wide range of applications.

## 9.2.2. - List of Variables

Variable	Descriptive Name	T	U	Range - References
$\rho(b,j,f)$	stratospheric aerosol corrected reflectance for pixel $j,f$ in band $b$	i	dl	from step 2.1c (§5.4)
LANDCONS_F( $j,f$ )	Land/water consolidated flag	i	-	from step 2.1c (§5.4)
INVALID_F( $j,f$ )	Invalid pixel flag	i	-	from step 2.1a (§3.4)
CLOUD_F( $j,f$ )	Cloud pixel flag	i	-	from step 2.1c (§5.4)
$\theta_s(j,f)$	Sun zenith angle for pixel $j,f$	i	deg	from step 2.1a (§3.4)
$\theta_v(j,f)$	MERIS viewing angle for pixel $j,f$	i	deg	from step 2.1a (§3.4)
$\Delta\phi(j,f)$	Azimuth difference for pixel $j,f$	i	deg	from step 2.1a (§3.4)
blue_band_N	Blue band index number	s		
nir_band_N	Near infrared band index number	s		
red_band_N	Red band index number	s		
L[set][order]	Coefficients used for the polynomial ratios of reflectance rectification and TOAVI	s	dl	set: 1..5 order: 1..12
K_toavi[Class][band]	$K_i$ toavi coefficients	s	dl	Class: VEG or BRIGHT Band: blue, red and nir
Theta_toavi[Class][band]	Theta toavi coefficients	s	dl	<i>idem</i>
Const_rho[Class][band]	Const_rho coefficients (1 coefficient for each blue, red and near infrared band)	s		<i>idem</i>
Max_rho[band]	Maximum acceptable TOA reflectances	s	dl	Band: blue, red and nir
Thresh_nir2red_ref	Near infrared to Red reflectance maximum ratio	s	dl	
BAD_VALUE	Output value when algorithm fails	s	-	see § 2
Normalized_rho_blue Normalized_rho_red Normalized_rho_nir	Normalized reflectances for the blue, red and near infrared bands	c	dl	
Rectified_rho_blue	Rectified reflectances for the blue band	c	dl	
TOAVI_CLASS_VEG( $j,f$ )	Flag vegetated surface from TOAVI spectral tests	c	dl	
Class	Pixel class for Normalisation	c	dl	VEG or BRIGHT
ORINP1_F( $j, f$ )	Out of range input flag # 1	o	dl	Boolean, to step 2.10 (§10.4), to Breakpoint
OROUT1_F( $j, f$ )	Out of range output flag # 1	o	dl	<i>idem</i>
TOAVI ( $j,f$ )	TOA Vegetation Index for pixel $j,f$	o	dl	to step 2.10 (§10.4), to Breakpoint
Rectified_rho_red( $j,f$ )	Rectified reflectance for red band	o	dl	to step 2.10 (§10.4) , to Breakpoint
Rectified_rho_nir( $j,f$ )	Same as above for near infrared band	o	dl	to step 2.10 (§10.4) , to Breakpoint
TOAVI_CLASS_BAD( $j,f$ )	Flag Bad data from TOAVI spectral tests	o	dl	To step 2.10 (§10.4)
TOAVI_CLASS_CSI( $j,f$ )	Flag Cloud, snow or ice from TOAVI spectral tests	o	dl	To step 2.10 (§10.4)
TOAVI_CLASS_WS( $j,f$ )	Flag water or deep shadow from TOAVI spectral tests	o	dl	To step 2.10 (§10.4)
TOAVI_CLASS_BRIGHT( $j,f$ )	Flag bright from TOAVI spectral tests	o	dl	To step 2.10 (§10.4)
TOAVI_CLASS_INVALID_REC( $j,f$ )	Flag invalid rectification	o	dl	To step 2.10 (§10.4)

### 9.2.3.2 – Function Normalize\_f ( $\theta_s$ , $\theta_v$ , band, class)

The **Normalize\_F( $\theta_s$ ,  $\theta_v$ , band, class)** function is defined as follows :

NOTE:

Parameters  $G$ ,  $\cos g$ ,  $f_1$ ,  $f_2$ ,  $f_3$  are local parameters with unspecified meaning /range /unit.

Parameters **band** (NOT a MERIS band number) and **class** are indexes for arrays  $K_{toavi}$ ,  $\Theta_{toavi}$ .

$$G = \sqrt{\tan^2 \theta_s + \tan^2 \theta_v - 2 \cdot \tan \theta_s \cdot \tan \theta_v \cdot \cos \Delta\phi} \quad (2.2-13)$$

$$\cos g = \cos \theta_s \cdot \cos \theta_v + \sin \theta_s \cdot \sin \theta_v \cdot \cos \Delta\phi \quad (2.2-14)$$

If

$$f_1 = \frac{(\cos \theta_s \cdot \cos \theta_v)^{(K_{toavi}(\text{Class}, \text{band})-1)}}{(\cos \theta_s + \cos \theta_v)^{(1-K_{toavi}(\text{Class}, \text{band}))}} \quad (2.2-15)$$

$$f_2 = \frac{1 - \Theta_{toavi}(\text{Class}, \text{band})^2}{(1 + 2 \cdot \Theta_{toavi}(\text{Class}, \text{band}) \cdot \cos g + \Theta_{toavi}(\text{Class}, \text{band})^2)^{3/2}} \quad (2.2-16)$$

$$f_3 = 1 + \frac{1 - \text{Const\_rho}(\text{Class}, \text{band})}{1 + G} \quad (2.2-17)$$

$$\text{Normalize\_F} = f_1 \cdot f_2 \cdot f_3 \quad (2.2-18)$$

End of **Normalize\_F** function

### 9.2.3.3 - Function Polynomial\_ratio( $\rho_1, \rho_2, \text{set}$ )

The **Polynomial\_ratio( $\rho_1, \rho_2, \text{band}$ )** function is defined as follows :

$$\text{Polynomial\_ratio} = \quad (2.2-19)$$

$$\frac{L(\text{set}, 1) \cdot \rho_1^2 + L(\text{set}, 2) \cdot \rho_2^2 + L(\text{set}, 3) \cdot \rho_1 \cdot \rho_2 + L(\text{set}, 4) \cdot \rho_1 + L(\text{set}, 5) \cdot \rho_2 + L(\text{set}, 6)}{L(\text{set}, 7) \cdot \rho_1^2 + L(\text{set}, 8) \cdot \rho_2^2 + L(\text{set}, 9) \cdot \rho_1 \cdot \rho_2 + L(\text{set}, 10) \cdot \rho_1 + L(\text{set}, 11) \cdot \rho_2 + L(\text{set}, 12)}$$

## 9.2.4. - Quality Control and Diagnostics.

Range checks are performed on input reflectances, normalised reflectances, rectified reflectances, see section 9.2.3 above.

## 9.2.5. - Exception Handling

See blocks labelled "exception processing:... end of exception processing" in section 9.2.3 above.

### 9.3. - Atmospheric correction over land (step 2.6.23)

This scheme is detailed in RD 8, sections 2.15, 2.17. The input of the algorithm are TOA reflectances, corrected for gaseous absorption and stratospheric aerosols, above all valid land pixels. The outputs of the algorithm are:

- Rayleigh corrected reflectances for all pixels;
- Dense Dark Vegetation (DDV) flag for all pixels;
- aerosol model index and Angström exponent for pixels flagged as DDV;

#### 9.3.1. – Mathematical Description of the Algorithm

Figure 9.3.1-1 below describes the processing of the atmospheric correction over land in 13 MERIS bands (basic set of 15 bands described in section 2, minus the O<sub>2</sub> absorption band at 761.25 nm (band 11) and H<sub>2</sub>O absorption band at 900 nm (band 15)).

##### 9.3.1.1. - Rayleigh Correction Processing (step 2.6.15)

Rayleigh correction processing is organised in several steps (Fig. 9.3.1-2 below). First the Rayleigh reflectance, Rayleigh transmittance and Rayleigh spherical albedo are computed for every pixel. Then, the TOA apparent reflectance corrected for gaseous absorption  $\rho_{ng}^*$  is corrected for Rayleigh contributions for each pixel in order to derive the top of aerosol reflectance  $\rho_{top}$ .

##### 9.3.1.2. – Dense Dark Vegetation (DDV) Screening (step 2.6.13)

DDV screening consists in flagging pixels identified as DDV (RD8, 2.17) by comparing a spectral index, the Atmosphere Robust Vegetation Index (ARVI), to a tabulated threshold which depends on Earth location and on the date of data acquisition. The ARVI is built using MERIS bands 2 (442 nm), 7 (665 nm) and 13 (865 nm).

##### 9.3.1.3 – Aerosol above DDV (step 2.6.17)

Aerosol type and optical thickness are estimated for DDV pixels.

Aerosol optical thickness is provided at 442 nm (MERIS band 2), where the ground contribution to the signal is best accounted for. It is also derived at MERIS bands 1 and/or 7 (412 and 665 nm), allowing to characterise the aerosol Angström exponent, namely the  $\alpha^3$  product,

expressing the spectral dependence of the optical thickness:  $\tau(\lambda) = \tau(\lambda_0) \cdot \left(\frac{\lambda}{\lambda_0}\right)^{-\alpha}$ . The nature of

the aerosol models used above Land ensure that alpha remains constant over the whole MERIS spectral range.

<sup>3</sup> literature show the use of 2 definitions for alpha: with and without the minus sign. Present choice is arbitrary.

### 9.3.3. - Equations

For each pixel (j, f) such that LANDCONS\_F (j, f) == TRUE (2.6.23-1)

deleted (2.6.23-2), (2.6.23-3), (2.6.23-4), (2.6.23-5)

#### 9.3.3.1. - Rayleigh correction (step 2.6.15)

##### 1. Estimation of Rayleigh reflectance (step 2.6.15.1)

deleted (2.6.15.1-3), (2.6.15.1-4), (2.6.15.1-5).

For each band b in {b412..b753,b775..b885}

##### 2. Estimation of Rayleigh transmittance $T_R$ (step 2.6.15.2)

Compute Rayleigh transmittance on sun-surface path

$$T_R(\theta_s, b) = \frac{(2/3 + \cos(\theta_s)) + (2/3 - \cos(\theta_s)) \cdot e^{-\frac{\tau_{R0}(b, j, f)}{\cos(\theta_s)}}}{4/3 + \tau_{R0}(b, j, f)} \quad (2.6.15.2-1)$$

$$T_{R_{\theta_s}}(b, j, f) = t_0 + t_1 T_R(\theta_s, b) + t_2 T_R^2(\theta_s, b) \quad (2.6.15.2-2)$$

Compute Rayleigh transmittance on surface-sensor path

$$T_R(\theta_v, b) = \frac{(2/3 + \cos(\theta_v)) + (2/3 - \cos(\theta_v)) \cdot e^{-\frac{\tau_{R0}(b, j, f)}{\cos(\theta_v)}}}{4/3 + \tau_{R0}(b, j, f)} \quad (2.6.15.2-3)$$

$$T_{R_{\theta_v}}(b, j, f) = t_0 + t_1 T_R(\theta_v, b) + t_2 T_R^2(\theta_v, b) \quad (2.6.15.2-4)$$

##### 3. Estimation of Rayleigh spherical albedo $S_R$ (step 2.6.15.3)

$$S_R(b, j, f) = \text{Rayalb\_LUT interpol} : (\tau_{R0}(b, j, f)) \quad (2.6.15.3-1)$$

##### 4. Estimation of reflectance corrected for Rayleigh scattering (step 2.6.15.4)

deleted (2.6.15.4-1), (2.6.15.4-2), (2.6.15.4-3), (2.6.15.4-4)

$$\rho_{\text{top}}^{\text{C}}(b, j, f) = \frac{\rho_{\text{ng}}^*(b, j, f) - \rho_{\text{R1}}(b, j, f)}{T_{\text{R}_{-\theta\text{s}}}(b, j, f) \cdot T_{\text{R}_{-\theta\text{v}}}(b, j, f)} \quad (2.6.15.4-5)$$

**exception processing:**  $\rho_{\text{top}}^{\text{C}}(b, j, f) \leq 0$  in equation (2.6.15.4-5) above:

RWNEG(b, j, f) = TRUE

DDV\_F(j, f) = FALSE

continue processing at 2.6.15.4-6

skip steps 2.6.13 and 2.6.17 for pixel (j, f)

**end of exception processing**

$$\rho_{\text{top}}(b, j, f) = \frac{\rho_{\text{top}}^{\text{C}}(b, j, f)}{1 + S_{\text{R}}(b, j, f) \cdot \rho_{\text{top}}^{\text{C}}(b, j, f)} \quad (2.6.15.4-6)$$

**Endfor** End of loop over bands

**Endfor** End of loop over *pixels*

### 9.3.3.2. - DDV Screening (step 2.6.13)

**For each** 4x4 pixels sub-window containing at least one pixel such that (LANDCONS\_F(j, f) == TRUE)

*latitude and longitude of window North-East corner*

Let  $j_0$ =north-east corner column index,  $f_0$ = north-east corner line index,

$$\text{lat}_0 = \text{lat}(j_0, f_0) \quad (2.6.13-7)$$

$$\text{lon}_0 = \text{lon}(j_0, f_0) \quad (2.6.13-8)$$

*select DDV model as a function of latitude, longitude and month*

$$\text{biome} = \text{DDV\_clim nearest:}(\text{lat}_0, \text{lon}_0) \quad (2.6.13-1)$$

$$\text{DDV\_model} = \text{DDV\_LUT select:}(\text{biome}, \text{month}) \quad (2.6.13-9)$$

**For each** pixel (j, f) in 4 x 4 window such that (LANDCONS\_F(j, f) == TRUE)

*Interpolate ARVI threshold as a function of geometry and DDV model*

$$\text{ARVI\_thres}(j, f) = \text{DDV\_ARVI\_LUT interpol:}(\theta_{\text{s}}(j, f), \theta_{\text{v}}(j, f), \Delta\phi(j, f) \text{ select:}(\text{DDV\_model})) \quad (2.6.13-2)$$

*Compute ARVI index from MERIS measurements corrected for gaseous absorption and Rayleigh scattering*

$$\rho_{\text{RB}}(j, f) = \rho_{\text{top}}(b665, j, f) - \gamma[\rho_{\text{top}}(b442, j, f) - \rho_{\text{top}}(b665, j, f)] \quad (2.6.13-3)$$

**exception processing:**  $\rho_{\text{RB}}(j, f) \leq 0$  in (2.6.13-3):

DDV\_F(j, f) = FALSE

skip equations (2.6.13-4) to (2.6.13-6)

continue processing

**end of exception processing**

$$\text{ARVI}(j, f) = \frac{\rho_{\text{top}}(b865, j, f) - \rho_{\text{RB}}(j, f)}{\rho_{\text{top}}(b865, j, f) + \rho_{\text{RB}}(j, f)} \quad (2.6.13-4)$$

**Page** : 9 - 18

Compare computed ARVI with ARVI threshold and flag pixels identified as DDV

$\Delta\text{ARVI}_{\min} = \Delta\text{ARVI}_{\min\_LUT}$  **nearest:** (lat(j,f), lon(j,f)), **select:** (month) (2.6.13-10)

$\Delta\text{ARVI}(j,f) = \text{ARVI}(j,f) - \text{ARVI\_thres}(j,f)$  (2.6.13-11)

$\text{DDV\_F}(j,f) = (\Delta\text{ARVI}(j,f) > \Delta\text{ARVI}_{\min}) \text{ AND } (\rho_{\text{ng}}(b865, j, f) > R_{865\_CS})$  (2.6.13-5)

*deleted* (2.6.13-6)

**Endfor** End of loop over pixels

**Endfor** End of loop over 4x4 sub-windows

### 9.3.3.3. – Aerosols above DDV (step 2.6.17)

#### 0. Define the band set to be used for aerosol identification (once for all at initialisation) (step 2.6.17.0)

*Define the band set to be used for aerosol identification (once for all at initialisation)*

DDV\_BandSet = {}

nb\_DDV=0

**For** b in {b412,b442,b490,b665} /\* scan allowed bands in increasing wavelength order \*/

**If** ( (b ∈ DDV\_bands) AND (b ∉ DDV\_BandSet) ) **then** /\* add found ones, but only once \*/

DDV\_BandSet = DDV\_BandSet ∪ {b}

nb\_DDV = nb\_DDV+1

**endif**

**Endfor**

**exception processing:** nb\_DDV ∉ {2,3}:

issue error message

Stop processing

**end of exception processing**

**For each** 4x4 pixels sub-window containing at least one pixel such that (LANDCONS\_F(j,f) == TRUE)

#### 1. Read climatology and retrieve aerosol model as a first guess for optical thickness at 550nm (step 2.6.17.1)

Let j0=north-east corner column index, f0= north-east corner line index,

lat<sub>0</sub> = lat (j<sub>0</sub>, f<sub>0</sub>)

lon<sub>0</sub> = lon (j<sub>0</sub>, f<sub>0</sub>)

iaer0 = Aerclim\_LUT **nearest:** (lat<sub>0</sub>, lon<sub>0</sub>, month) **select:** (k=2) (2.6.17.1-1)

*deleted* (2.6.17.1-2)

#### 2. Select refractive index corresponding to the aerosol model found in climatology and the N-1 additional aerosol models having the same refractive index (step 2.6.17.2)

m = Aerosol\_refindex (iaer0) (2.6.17.2-1)

Scan the table Aerosol\_refindex to find additional aerosol models AerModels[0..N-1] that give the same refractive index; in other words that satisfy for all i (i between 0 and N-1):

Aerosol\_refindex (AerModels[i]) == m (2.6.17.2-2)  
 deleted (2.6.17.2-3)  
 deleted (2.6.17.2-4)

**3. Derive optimal aerosol model within the set of N models, and its optical thickness, by iterative procedure (2.6.17.3)**

*Define geometry quantities at North-East corner of 4x4 window* (2.6.17.3-0)

$\theta_{s\_4x4} = \theta_s(j_0, f_0)$

$\theta_{v\_4x4} = \theta_{vs}(j_0, f_0)$

$\Delta\phi_{4x4} = \Delta\phi_s(j_0, f_0)$

$M_{4x4} = 1./\cos(\theta_{s\_4x4}) + 1./\cos(\theta_{v\_4x4})$

**For each** pixel (j,f) in 4 x 4 window such that DDV\_F(j,f) = TRUE

*Interpolate reflectances for DDV pixels for selected bands and selected DDV model*

UsedAerModels = AerModels

**For each** band b in DDV\_bandSet

$\rho_{DDV}(b,j,f) = DDV\_THR\_LUT$  **interpol:**( $\theta_{s\_4x4}, \theta_{v\_4x4}, \Delta\phi_{4x4}$ )  
**select:**(DDV\_model, band = b) (2.6.17.3-1)

*Compute surface reflectance at every band*

$C\_Corr(b) = RefCorr(lat, lon, month, b, \rho_{DDV}(b,j,f), \Delta ARVI)$  (2.6.17.3-51)

$\rho_{Ground}(b) = \rho_{DDV}(b,j,f) \cdot C\_Corr$  (2.6.17.3-52)

*Compare surface reflectance at 665 nm to threshold*

**If** b == b665 AND  $\rho_{Ground}(b) > \rho_{Ground665\_Threshold}$  **then**

*Too high: no chance to find good match, disable iterative search and select aerosol from climatology.*

UsedAerModels = {iaer0}

**endif**

**End for** *End of loop over bands*

*Derive aerosol model and optical thickness by iterative procedure*

*(Iterative procedure for aerosol optical thickness (at all bands in DDV\_BandSet) estimate: top of Rayleigh reflectances at each band are estimated; we vary optical thickness  $\tau_a$  in order to match measured top of Rayleigh reflectance  $\rho_{ng}^*(b,j,f)$ ).*

**NOTES:**

The procedure *top\_of\_rayleigh\_ref*, computing the reflectance above Rayleigh and aerosols layers for a given aerosol model, optical thickness, surface reflectance, geometry, is specified in section 9.3.3.6 below.

The function *taua* to derive aerosol optical thickness at one band b':  $\tau_a(b')$ , from its value at another band b:  $\tau_a(b)$ , for aerosol model *iaer*, is specified in section 9.3.3.7 below.

**exception processing:**  $\rho_{Ground}(b) > \rho_{top}(b,j,f)$  for any  $b \in DDV\_BandSet$ :

### 9.3.3.4 - Procedure *calc\_robar\_ag* to calculate aerosol ground BRDF coupling term

The List of variables below identifies the dummy input and output variables of the procedure. Actual inputs and outputs should be traced to whichever algorithm step the procedure is called from. Other variables of the procedure, whether read from a database or computed locally, are listed in table 9.3.2 above.

Variable	Descriptive Name	T	U
$\Delta\phi$	Azimuth angle between pixel-sensor and pixel-sun plane	i	deg
$\theta_s$	Sun zenith angle	i	deg
$\theta_v$	Viewing zenith angle	i	deg
Iaer	aerosol model index	i	dl
DDV_model	DDV model index	i	dl
b	MERIS band index	i	dl
Rob_ag( $\theta_s, \theta_v$ )	Aerosol ground BRDF coupling term	o	dl

The *calc\_robar\_ag* procedure is called by procedure *top\_of\_rayleigh\_ref* (§ 9.3.3.6).

The *calc\_robar\_ag* procedure is defined as follows:

*Compute Fourier series terms*

**For each Fourier series order s = 0...4**

$ag\_FOU^{(s)} = robar\_ag\_LUT \text{ interpol: } (\theta_s, \theta_v) \text{ select: } (s, b, iaer, DDV\_model)$

(2.6.17.3.1-1)

**Endfor** *End of loop over index s*

*Compute aerosol ground coupling term as a Fourier sum*

*/\* care of the azimuth \*/*

$Rob\_ag(\theta_s, \theta_v) = ag\_FOU^{(0)} + 2ag\_FOU^{(1)} \cos(\Delta\phi) + 2ag\_FOU^{(2)} \cos(2(\Delta\phi))$   
 $\quad + 2ag\_FOU^{(3)} \cos(3(\Delta\phi)) + 2ag\_FOU^{(4)} \cos(4(\Delta\phi))$  (2.6.17.3.1-2)

**return** Rob\_ag

*End of calc\_robar\_ag procedure*

**return** Rob\_ra

*End of calc\_rob\_ar\_ra procedure*

### 9.3.3.6 - Procedure *top\_of\_rayleigh\_ref* to derive reflectance above Rayleigh and aerosols

#### 9.3.3.6.1 – Input /Output

The List of Variables below identifies the dummy input and output variables of the procedure. Actual inputs and outputs should be traced to whichever algorithm step the procedure is called from. Other variables of the procedure, whether read from a database or computed locally, are listed in table 9.3.2 above.

Variable	Descriptive Name	T	U
$\theta_s$	Sun zenith angle	i	deg
$\theta_v$	Viewing zenith angle	i	deg
$\Delta\phi$	Azimuth angle between pixel-sensor and pixel-sun plane	i	deg
M	air mass	i	dl
iaer	aerosol model index	i	dl
$\tau_a$	aerosol optical thickness	i	dl
$\rho_{R1}$	Rayleigh reflectance	i	dl
$T_{R_{\theta_s}}, T_{R_{\theta_v}}$	Rayleigh transmittance	i	dl
$S_R$	Rayleigh spherical albedo	i	dl
$\rho_{Ground}$	Corrected surface reflectance	i	dl
$C\_Corr$	correction factor for DDV reflectance and coupling terms	i	i
DDV_model	DDV model index	i	dl
$\tau_{R0}$	Rayleigh optical thickness	i	dl
band	band index	i	dl
$\rho_{ag}$	reflectance at top of Rayleigh and aerosol	o	dl

The *top\_of\_rayleigh\_ref* procedure is called by step 2.6.17.3.

#### 9.3.3.6.2 - Equations

**NOTE:** The procedure **ref\_aerosol** computing the aerosols reflectance for a given aerosol model, optical thickness, geometry, is specified in section 5.5.7.

The *top\_of\_rayleigh\_ref* function is defined as follows :

$$\cos\Theta_{scat} = -\sqrt{1 - \cos^2 \theta_s} \cdot \sqrt{1 - \cos^2 \theta_v} \cdot \cos \Delta\phi - \cos \theta_s \cdot \cos \theta_v \quad (2.6.17.3.3-1)$$

$$Px\omega_0 = \text{Aerpha\_LUT interpol:}(\cos\Theta_{scat}) \text{ select:}(\text{iaer}) \quad (2.6.17.3.3-2)$$

### 9.3.3.7 - Procedure *taua* to compute aerosol optical thickness at band b

#### 9.3.3.7.1 – Input /Output

The List of variables below identifies the dummy input and output variables of the procedure. Actual inputs and outputs should be traced to whichever algorithm step the procedure is called from. Other variables of the procedure, whether read from a database or computed locally, are listed in table 9.3.2 above.

Variable	Descriptive Name	T	U
$\tau_{a0}$	aerosol optical thickness at reference wavelength	i	dl
$\lambda_0$	Reference wavelength	i	nm
$\lambda(b)$	Wavelength at band b	i	nm
$\alpha$	Angström exponent	i	dl
$\tau_a(b)$	aerosol optical thickness at band b	o	dl

The procedure *taua* is called by step 2.6.17.3 and by procedure *top\_of\_rayleigh\_ref* (§ 9.3.3.6).

#### 9.3.3.7.2 - Equations

The procedure *taua* is defined as follows:

Compute aerosol optical thickness

$$\tau_a(b) = \tau_{a0} \cdot \left( \frac{\lambda(b)}{\lambda_0} \right)^{-\alpha} \quad (2.6.17.4-4)$$

return  $\tau_a(b)$

### 9.3.3.7 - Procedure *RefCorr* to compute the correction factor required to derive surface reflectance from DDV reflectance

#### 9.3.3.7.1 – Input /Output

The List of variables below identifies the dummy input and output variables of the procedure. Actual inputs and outputs should be traced to whichever algorithm step the procedure is called from. Other variables of the procedure, whether read from a database or computed locally, are listed in table 9.3.2 above.

Variable	Descriptive Name	T	U
Lat, Lon	Latitude and longitude	i	
month	Month of measurement	i	-
band	band index	i	dl
$\rho_{DDV}$	surface reflectance of DDV	i	dl
$\Delta ARVI$	Difference between ARVI of current pixel and ARVI threshold	i	dl

The procedure *RefCorr* is called by step 2.6.17.3 and by procedure *top\_of\_rayleigh\_ref* (§ 9.3.3.6).

#### 9.3.3.7.2 - Equations

The procedure *RefCorr* is defined as follows:

$C\_norm = Cnorm\_LUT$  nearest: (lat, lon), select(month, band) (2.6.17.3.3-14)

slope=DDV\_Slope\_LUT nearest: (lat, lon), select(month, band) (2.6.17.3.3-15)

$\rho_{Ground} = \rho_{DDV} * C\_norm$  (2.6.17.3.3-16)

$\Delta ARVI_{max} = \Delta ARVI_{max\_LUT}$  nearest: (lat, lon), select: (month) (2.6.17.3.3-17)

**If**  $\Delta ARVI < \Delta ARVI_{max}$  **then**

$C\_ext = (slope * \Delta ARVI + \rho_{Ground}) / \rho_{Ground}$  (2.6.17.3.3-18)

**Else**

$C\_ext = (slope * \Delta ARVI_{max} + \rho_{Ground}) / \rho_{Ground}$  (2.6.17.3.3-19)

**Endif**

CorrFactor =  $C\_norm * C\_ext$  (2.6.17.3.3-20)

**return** CorrFactor

#### 9.3.4. - Confidence checks and diagnostics

The algorithm is able to estimate a valid  $\rho_{top}$  above any valid land pixel.

#### 9.3.5. - Exception Handling

Any pixel such that INVALID\_F = TRUE shall not be processed (2.6.23-6)

See blocks "exception processing:... end of exception processing" in section 9.3.3 above.

## 9.4. - MERIS Bottom Of Atmosphere Vegetation Index (BOAVI) (step 2.8)

### 9.4.1. – Mathematical Description of the Algorithm

The diagram in figure 9.4.1-1 shows the logic of the BOA Vegetation Index computation. The products delivered by the atmospheric corrections processing are used as input to the BOAVI algorithm.

*Figure 9.4.1-1 : MERIS Level 2 BOAVI computation (step 2.8)*

The processing is only applied to land pixels. The algorithm is the MERIS Terrestrial Chlorophyll Index (MTCI).

### 9.4.2. - List of Variables

Variable	Descriptive Name	T	U	Range - References
$\rho_{top}(b,j,f)$	Top of aerosol reflectance for land pixels	i	dl	b: 3 bands specified through external data ; from step 2.6.23.
INVALID_F(j,f)	Invalid pixel flag	i	-	from step 2.1a
LANDCONS_F(j,f)	Land/water consolidated flag	i	-	from step 2.1c
BOAVI_RANGE(0..1)	Range limits for BOAVI	s	dl	0: min. valid value, 1: max. valid value
boavi_red_band	red band number for BOAVI	s	dl	Nominally b681
boavi_nir1_band	near infrared band #1 for BOAVI	s	dl	Nominally b705
boavi_nir2_band	near infrared band #2 for BOAVI	s	dl	Nominally b753
boavi_nir3_band	near infrared band #3 for BOAVI	s	dl	Nominally b865
$\rho_{red\_max}$	Maximum value of $\rho_{top}$ in red band to allow MTCI computation	s	dl	Nominally 0.3
$\rho_{nir2\_min}$	Minimum value of $\rho_{top}$ in nir2 band to allow MTCI computation	s	dl	Nominally 0.1
$\rho_{diff\_min1}$	Minimum value of the reflectance difference between nir1 and red to allow MTCI computation	s	dl	Nominally $1.0 \cdot 10^{-6}$
$\rho_{diff\_min2}$	Minimum value of the reflectance difference between nir3 and red to allow MTCI computation	s	dl	Nominally 0.05
BAD_VALUE	Output value when algorithm fails	s	-	see § 2
BOAVI (j,f)	Vegetation index	o	dl	to step 2.10, to Breakpoint
ORINP2_F(j,f)	Out of range input flag for BOAVI	i/o	-	default: FALSE, to step 2.10, to Breakpoint
OROUT2_F(j,f)	Out of range output flag for BOAVI	i/o	-	default: FALSE, to step 2.10, to Breakpoint

## 10. - MERIS Level 2 Product Formatting Algorithm

### 10.1 - Introduction

This chapter describes the processing to be applied to parameters used or created during the MERIS Level 2 processing, to generate the MERIS Level 2 products: Reduced Resolution and Full Resolution geophysical products.

### 10.2 - Algorithm Overview

MERIS processed data samples corresponding annotations and flags are collected from previous steps and formatted according to Level 2 product description in AD4.

### 10.3- Algorithm Description

#### 10.3.1 - Theoretical Description

##### 10.3.1.1 - Physics of The Problem

Each MERIS Level 2 geo-physical product is derived from a MERIS Level 1B product (herein after called "parent L1B product") and auxiliary parameter files specific of the MERIS Level 2 processing.

The MERIS Level 2 product is composed of : the Main Product Header (MPH), the Specific Product Header (SPH), one Summary Quality Annotation Data Sets (SQ ADS) ), one Global Annotation Data Sets (GADS), one Annotation Data Sets and twenty Measurement Data Sets.

The MPH allows to identify the product and some of its main characteristics.

The SPH contains references to external data files and Data Sets descriptors, as well as general information applicable to the product such as sensor characteristics, PCD and metrics summary. A large amount of SPH contents can be directly derived from the parent L1B product SPH.

The first ADS (SQ ADS) contains information on the quality of the product.

The GADS contains all the data scaling factors.

The second ADS contains information on geo-location, measurement viewing and illumination geometry and auxiliary environment parameters for a subset of the product pixels: the tie-points. One ADSR includes the set of tie points corresponding to a given satellite location. It is the same as in the parent Level 1B product.

The Measurement Data Sets (MDS) contain geo-physical parameters derived by the L2 processing. The products are distributed in order to obtain

- maximum homogeneity of the information: the "reflectance" bands, for instance, contain reflectance whatever the underlying surface is;
- maximum storage efficiency: the bytes allocated for a given pixel will be used to store different parameters, relevant to the surface observed.

The Flags MDS (20) contains all information needed to decode and check for quality the distributed pixel information.

**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 10 - 2

One MDSR includes the parameters for all pixels corresponding to a given time sample of MERIS. The term "product line" will be used hereafter to name the MDSRs of the different MDS for the same time sample, i.e. with the same MDSR index.

Information coming either from parent Level 1B product, from external data sources, or generated by any processing step are gathered, organised, scaled and coded according to AD4 specifications to build the Level 2 product file.

## 10.3.1.2 - Mathematical Description of Algorithm

### 10.3.1.2.1 - Main Product Header

Main product header is formatted as described in AD4. The Error Message MPH field summarises the errors encountered in processing.

### 10.3.1.2.2 - Specific Product Header

Specific product header is formatted as described in AD4.

### 10.3.1.2.3 - Annotation Data Set "Summary Product Quality"

The annotation data set is composed of one Annotation Data Set Records (ADSR) for every 8 tie frames, i.e. every 128 (Reduced Resolution) or 512 (Full Resolution) product lines.

Each ADSR, following AD4, is composed of :

- Start time of the measurement or MJD, modified Julian Day of time sample
- Attachment Flag
- % of water pixels having absorbing aerosols (wrt water pixels)
- % of water, % of DDV land, % of land, % of cloud pixels (wrt valid pixels);
- % of pixels w/ **bad surface** pressure (wrt valid **Land** pixels);
- % of pixels w/ **bad cloud top** pressure (wrt valid **Cloud** pixels);
- % of pixels w/ out of range inputs for water vapour processing (wrt valid pixels);
- % of pixels w/ out of range outputs for water vapour processing (wrt valid pixels);
- % of pixels w/ out of range inputs for Cloud processing (wrt cloud pixels);;
- % of pixels w/ out of range outputs for Cloud processing (wrt cloud pixels);
- % of pixels w/ out of range inputs for Land processing (wrt land pixels);
- % of pixels w/ out of range outputs for Land processing (wrt land pixels);
- % of pixels w/ out of range inputs for Water processing (wrt water pixels);
- % of pixels w/ out of range outputs for Water processing (wrt water pixels);
- % of pixels w/ out of range inputs for Case 1 processing (wrt water pixels);
- % of pixels w/ out of range outputs for Case 1 processing (wrt water pixels);
- % of pixels w/. out of range inputs for Case 2 processing (wrt water pixels);
- % of pixels w/. out of range outputs for Case 2 processing (wrt water pixels);

The counters are accumulated according to every pixel in the time interval between a Q-ADSR (included) and the following one (excluded) and dumped to the Q-ADSR. The last Q-ADSR of the product may relate to a smaller number of product lines than the others.

### 10.3.1.2.4 - Global Annotation Data Set - Scaling Factors

Global Annotation Data Set is formatted as described in AD4. Scaling factors and offsets are read from an auxiliary data product.

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name** : MERIS Level 2 Detailed Processing Model  
**Issue** : 8 **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 10 - 3

### 10.3.1.2.5 - Annotation Data Set "Tie Points Location and corresponding Auxiliary Data"

Annotation Data Set "Tie Points Location and corresponding Auxiliary Data" is the same as found in the parent L1B product.

### 10.3.1.2.6 - Measurement Data Sets

There are 20 MDS:

- MDS 1 to 13 for the Normalised Reflectance for any valid pixel, at those MERIS bands not dedicated to gaseous absorption measurements: b412, b442, b490, b510, b560, b620, b665, b681, b705, b753, b775, b865, b885;
- MDS-14 for total water vapour for any valid pixel;
- MDS-15 for Algal Pigment Index I (water pixels) or TOAVI (land pixels) or Cloud Top Pressure (cloud pixels);
- MDS-16 for Yellow Substance and Total Suspended Matter (water pixels);
- MDS-17 for Algal Index II (water pixels) or BOAVI (land pixels);
- MDS-18 for PAR (water pixels) or Cloud Albedo (cloud pixels) or surface pressure (land and bright pixels);
- MDS-19 for Aerosols Angström exponent and optical thickness (water, land pixels) or cloud type and Optical Thickness (cloud pixels);
- MDS-20 for the associated flags for any pixel;

with the same record structure : an MDS is composed of one Measurement Data Set Record (MDSR) by product time sample. The structures are specified in AD4.

The normalised surface reflectance MDSR contains, according to AD4 :

- start time of sample in MJD2000 format;
- quality indicator (0 if nominal, -1 if no data are available; in such a case the data field of the MDSR is filled with zeroes);
- one (scaled) normalised surface reflectance value per pixel (1121 in RR, 2241 in FR, 1153 in FR imagette, 4481 in FR FullSwath).

Geo-physical parameters are expressed in counts using the scaling factor and offset stored in the GADS. Each value is stored in one or two bytes.

The flag MDSR contains :

- start time of sample in MJD2000 format;
- quality indicator
- one flag set (three bytes) per pixel (1121 in RR, 2241 in FR, 1153 in FR imagette, 4481 in FR FullSwath).

The coding of flags is specified in AD4.

## 10.4 - List of variables

Indexing convention :

- subscript b stands for the band index
- subscript j for the product pixel index
- subscript f for the product line index

Variable	Descriptive Name	T	U	Range-Reference
<b>Product flags</b>				
LAND_F(j,f)	Land/water pixel flag	i	dl	from L1B product flags MDS
COASTLINE_F(j,f)	Coastline pixel flag	i	dl	<i>idem</i>
DUPLICATED_F(j,f)	Duplicated pixel flag	i	dl	<i>idem</i>
COSMETIC_F(j,f)	Cosmetic pixel flag	i	dl	<i>idem</i>
SUSPECT_F(j,f)	Suspect pixel flag	i	dl	<i>idem</i>
INVALID_F(j,f)	Invalid pixel flag	i	dl	<i>idem</i>
PCD_NN_F(j,f)	Out of range input or output for NN pressure estimate	i	dl	<a href="#">from step 2.1b, §4.4</a>
CLOUD_F(j,f)	Cloud flag	i	dl	from step 2.1c, §5.4
SNOW_ICE_F(j,f)	<a href="#">Snow or Ice flag</a>	i	dl	<a href="#">From step 2.1c, § 5.4</a>
ORINPWV_F(j,f)	Out of range input for Water Vapour processing	i	dl	from step 2.3, §6.4
OROUTWV_F(j,f)	Out of range output for Water Vapour processing	i	dl	from step 2.3, §6.4
ICE_HIGHAERO_F(j,f)	Ice or high aerosol loading flag	i	dl	from step 2.6.5, §8.2.2
LANDCONS_F(j,f)	Consolidated Land flag	i	dl	from step 2.1c, §5.4
MEGLINT_F(j,f)	Medium Glint flag	i	dl	from step 2.6.5, §8.2.2
UNCGLINT_F(j,f)	Flag for pixels non corrected for glint	i	dl	from step 2.6.5, §8.2.2
HIINLD_F(j,f)	Flag for low pressure water	i	dl	from step 2.6.5, §8.2.2
WHITECAPS_F(j,f)	Whitecaps flag	i	dl	from step 2.6.5, §8.2.2
DDV_F(j,f)	Dark Dense Vegetation flag	i	dl	from step 2.6.23, §9.3.2
CASE2_S(j,f)	Turbid water flag	i	dl	from step 2.6.8, §8.3.2
BPAC_ON_F(j,f)	Bright Pixel Atmosphere Correction turned ON flag	i	dl	from step 2.6.8, §8.3.2
WHITE_SCATT_F	Flag identifying “white” scatter within water	o	-	from step 2.6.8, §8.3.2
ACFAIL_F(j,f)	Atmosphere correction failed flag	i	dl	from step 2.6.10 §8.3.2, 2.6.9 §8.4.2
ORINP0_F(j,f)	Out of range input for atmosphere corrections	i	dl	from steps 2.6.12 §5.4 (cloud and land) and 2.6.10 §8.3.2 (water)
OROUT0_F(j,f)	Out of range output for atmosphere corrections	i	dl	from step 2.6.12 §5.4
ORINP1_F(j,f)	Out of range input TOAVI or Case 1 or Cloud albedo	i	dl	from steps 2.2, 2.4 or 2.9 (§ 9.2.2, §7.4 or 8.5.4)
OROUT1_F(j,f)	Out of range output TOAVI or Case 1	i	dl	<i>Idem</i>
ANNOT(j,f)	Annotation flag for the quality of the atmosphere correction	i	dl	from step 2.6.9 (§8.4.2); coding in table 8.4.4-1
RWNEG(b, j, f)	Annotation flag for negative corrected reflectance	i	dl	from step 2.6.9 (§8.4.2) or 2.6.23 (§9.3.2); coding in §8.4.4.
CASE2ANOM_F(j,f)	Anomalous Scattering flag	i	dl	from step 2.9, §8.5.4
CASE2Y_F(j,f)	Case 2 (y) flag	i	dl	from step 2.9, §8.5.4

Variable	Descriptive Name	T	U	Range-Reference
ORINP2_F(j,f)	Out of range input BOAVI or Case 2 or cloud optical thickness	i	dl	from steps 2.4, 2.8 or 2.9 (§7.4, 9.4.2 or 8.5.4)
OROUT2_F(j,f)	Out of range output BOAVI or Case 2	i	dl	from steps 2.8 or 2.9 (§9.4.2 or 8.5.4)
TOAVI_CLASS_BAD(j,f)	Flag Bad data from TOAVI spectral tests	i	dl	From step 2.2
TOAVI_CLASS_CSI(j,f)	Flag Cloud, snow or ice from TOAVI spectral tests	i	dl	From step 2.2
TOAVI_CLASS_WS(j,f)	Flag water or deep shadow from TOAVI spectral tests	i	dl	From step 2.2
TOAVI_CLASS_BRIGHT(j,f)	Flag bright from TOAVI spectral tests	i	dl	From step 2.2
TOAVI_CLASS_INVALID_RECT(j,f)	Flag invalid rectification from TOAVI spectral tests	i	dl	From step 2.2
<b>Product parameters</b>				
P(j,f)	Surface Pressure	i	hPa	from step 2.1b, §4.4
P <sub>top</sub> (j,f)	Cloud Top Pressure	i	hPa	from step 2.1b, §4.4
TOAVI(j,f)	Top of Atmosphere Vegetation Index	i	dl	from step 2.2, §9.2.2
W <sub>T</sub> (j,f)	Water vapour content	i	g.cm <sup>-2</sup>	from step 2.3, §6.4
α <sub>c</sub> (j,f)	Cloud Albedo	i	dl	from step 2.4, §7.4
τ <sub>c</sub> (j,f)	Cloud Optical Thickness	i	dl	from step 2.4, §7.4
Ctype (j,f)	Cloud type	i	dl	from step 2.4, §7.4
TOAR(b,j,f)	TOA Radiances	i	LU	All bands; from L1b MDS
ρ(b,j,f)	stratospheric aerosol corrected reflectance	i	dl	bands b412..b753, b775..b885 from step 2.1c, §5.4 (cloud)
ρ' <sub>w</sub> (b,j,f)	Normalised water-leaving reflectance	i	dl	bands b412..b753, b775..b885 from step 2.6.9, §8.4.2 or 2.10, §8.3.2 (water)
ρ <sub>top</sub> (b,j,f)	Top Of Aerosol Reflectance	i	dl	bands b412..b753, b775..b885 from step 2.6.23, §9.3.2 (land)
Rectified_rho_red(j,f)	Rectified reflect. for red band	i	dl	from step 2.2-1 §9.2.2
Rectified_rho_nir(j,f)	Same as above for near infrared band	i	dl	from step 2.2-1 §9.2.2
τ <sub>865</sub> (j,f)	Aerosol Optical Thickness at 865nm (water pixels)	i	dl	from step 2.6.9, §8.4.2 (water)
τ <sub>442</sub> (j, f)	Aerosol Optical Thickness at 442nm (land pixels)	i	dl	from step 2.6.23, §9.3.2 (land)
α <sub>775_865</sub> (j,f)	Aerosol Angström exponent	i	dl	from step 2.6.9, §8.4.2 or 2.10, §8.3.2 (water pixels only)
α(j,f)	Aerosol Angström exponent	i	dl	from step 2.6.23, §9.3.2 (land only)
BOAVI(j,f)	Bottom of Atmosphere Vegetation Index	i	dl	from step 2.8, §9.4.2
Chl1 (j,f)	Algal pigment index 1	i	mg.m <sup>-3</sup>	from step 2.9, §8.5.4
SPM (j,f)	Suspended Particulate Matter	i	g.m <sup>-3</sup>	from step 2.9, §8.5.4
ODOC (j,f)	Yellow Substance	i	m <sup>-1</sup>	from step 2.9, §8.5.4
Chl2 (j,f)	Algal pigment index 2	i	mg.m <sup>-3</sup>	from step 2.9, §8.5.4
PAR (j,f)	Photosynthetically Available Radiation	i	μEinstein.m <sup>-2</sup> .s <sup>-1</sup>	from step 2.9, §8.5.4
NC	Number of samples per output line	i	-	from parent L1B product SPH
DF	Number of lines between along track tie points	i	-	from parent L1B product SPH
NF	Number of frames in product	i	dl	from parent L1B product SPH
<b>SATURATED F(b,j,f)</b>	<b>Saturated pixel flag</b>	<b>i</b>	<b>-</b>	<b>from 2.1.4 (§3.5)</b>

*Table 10.4-1 - Parameters used in the Formatting algorithm (cont.)*

Note 1: X is a data structure reflecting the values stored in the MDS,  
 X(M,f,j) is the parameter of MDS number M at product frame f and column j  
 X(M,f,j)(k) is the parameter of MDS number M at product frame f and column j and byte k for multi-byte parameters,  
 e.g. yellow substance /total suspended matter in MDS 16.

## 10.5 - Equations

Note: data set structures are described precisely in AD4, in a way that allows to avoid a redundant description here.

### 10.5.1 - Step 2.10.1 Build MPH

format MPH according to AD4; ALL MPH fields are identical to the parent L1B MPH fields except for Product ID, Processing Center ID, UTC time of processing, Errors, Total size of product, Number of Data Sets attached

*(2.10.1-1)*

write MPH

### 10.5.2 - Step 2.10.2 Build SPH

Format SPH according to AD4; ALL SPH fields are identical to the parent L1B SPH fields except for the Data Set Descriptors

*(2.10.2-1)*

write SPH

### 10.5.3 - Step 2.10.3 Build GADS “Scaling Factors and Offsets”

Copy scaling factors for altitude, roughness, zonal wind, meridional wind, atmospheric pressure, ozone, relative humidity; gain setting, sampling rate, Sun spectral flux from the parent L1B GADS

*(2.10.3-1)*

*deleted (2.10.3-2) to (2.10.3-7)*

```

```
end switch
```

### 10.5.13 - Step 2.10.14 Build flags MDS

The logic of the combination of Internal flags (as defined in this document) to form Product Flags (as defined in AD4) is expressed in table below as a logical expression. Definitions of internal flags involved are listed together with their relevance with respect to pixel type. The column "Symbol" refers to the flags MDS, following AD4 table 5.4.1.8.8c. Symbols in the column "Equations" refer

## 10.6 - Accuracy Requirements

Start time field of Q-ADSR, ADSR, MDSR records shall be an exact copy of the start time field of the corresponding records of the parent L1B product.

Formatted values for all MDS fields shall be computed with an accuracy of 1 Least Significant Digit.

All tie point annotation fields shall be an exact copy of the tie point annotation fields of the parent L1B product.

All fields in Q-ADSR shall be computed with an accuracy of 1 Least Significant Digit.

## 10.7 - Product Confidence Data Summary

Product Formatting raises no PCD of its own. Confidence data computed in the previous steps are processed as follows:

### 10.7.1 - Flags obtained from the Level 1 processing

The quality flags obtained from Level 1 processing : SUSPECT\_F, COSMETIC\_F, are copied without modification to the corresponding bit in level 2 flags.

### 10.7.2 - Flags obtained from the Level 2 processing

Internal level 2 flags are combined according to Table 10.5.13 to yield Level 2 product flags.

### 10.7.3 - Summary quality ADS

Product metrics are provided by three counters: water pixels, land pixels, cloud pixels.

In addition to individual pixels flagging, the quality flags obtained from Level 2 processing : ORINPWV\_F, OROUTWV\_F, ORINP0\_F, OROUT0\_F, ORINP1\_F, OROUT1\_F, ORINP2\_F, OROUT2\_F, LOW\_POL\_F, LOW\_NN\_F are accumulated in a percentage per class (cloud, land, water, case 1 water, case 2 water, polynomial and NN pressure).

Attributes influencing the processing quality and Quality flags from the atmosphere corrections process are accumulated in a percentage per class:

1. water pixels having absorbing aerosols ;
2. Dense Dark Vegetation (DDV) land pixels, where the atmospheric corrections have been performed.

## 11 - BREAKPOINTS

The following data shall be used as breakpoints in the testing of the Level 2 processing. Subscripts (b, j, f) refer to band, product column, product frame. Unless explicitly stated, all bands, columns and frames are meaningful. Parameters are listed in the order of DPM appearance.

The column “cloud /land /water” indicates to which categories of pixel a breakpoint parameter is applicable. When not applicable, parameters should have a default value as specified in §2 above.

Symbol	Description	Unit	Cloud / Land / Water	Origin step no.	Required Accuracy

## 12 - LOW RESOLUTION PRODUCT EXTRACTION

The following section provides a specification of the algorithm to apply to Level 2 Reduced Resolution product pixels, to derive the Low Resolution Cloud and Water Vapour product pixels (see [A-4]).

The total water vapour (resp. cloud optical thickness or cloud top pressure) field of any LR pixel shall be the average of the water vapour field (resp. cloud optical thickness or cloud top pressure) of the corresponding 4x4 pixels in the RR grid. Correspondence is with respect to the product grids described in [A-4].

The following precautions shall be taken when performing the average:

1. Invalid pixels, i.e. those MER\_RR\_2P product pixels which have their product set to BAD\_PRODUCT in the corresponding MDS, should be discarded when computing the 4x4 pixels average, as well for cloud optical thickness, cloud top pressure as for total water vapour.
2. Cloud pixels shall NOT be taken into account in the Water Vapour averaging process, even if the water vapour content is valid, only Land and Water pixels shall be considered.
3. Cloud optical thickness or cloud top pressure are only applicable to cloudy pixels, i.e. those which bear the "cloud" class flag in MDS(20). For other valid pixels, the same field of the MER\_RR\_2P product stores the aerosol optical thickness. When averaging, non-cloudy RR pixels shall be discarded. It should be noted that this also applies to the extraction of MER\_RRC\_2P product.
4. image boundaries shall be handled as exceptions, 4x4 pixel blocks not being available near the last frame and last column.
5. spatial averaging cannot be applied to flags. Therefore a different algorithm needs to be applied to the MDS(20) Flags of MER\_RR\_2P, also to be sub-sampled, as follows:

# MERIS ESL

**Doc** : PO-TN-MEL-GS-0006  
**Name** : MERIS Level 2 Detailed Processing Model  
**Issue** : 8      **Rev** : 0B  
**Date** : 24 June 2011  
**Page** : 12 - 2

flag in MER_LRC_2P pixel	Conditions on MER_LRC_2P pixel type flags	Conditions on the flags of the averaged MER_RR_2P pixels
LAND		>50% <sup>(1)</sup>
CLOUD		>=50% <sup>(1)</sup>
WATER		>50% <sup>(1)</sup>
PCD_1_13		never (not relevant)
PCD_14	LAND OR WATER	>=50%
PCD_15	CLOUD	>=50% of the CLOUD pixels
PCD_16		never (not relevant)
PCD_17		never (not relevant)
PCD_18		never (not relevant)
PCD_19	CLOUD	>=50% of the CLOUD pixels
COASTLINE		1 or more
COSMETIC		>=50%
SUSPECT		>=50%
OADB		never (not relevant)
ABSOA_DUST		never (not relevant)
CASE2_S		never (not relevant)
CASE2_ANOM OR TOAVI_BRIGHT		never (not relevant)
CASE2_Y OR TOAVI_BAD		never (not relevant)
ICE_HAZE OR TOAVI_CSI		never (not relevant)
MEDIUM_GLINT OR TOAVI_WS		never (not relevant)
DDV OR BPAC_ON		never (not relevant)
HIGH_GLINT OR TOAVI_INVALID_REC		never (not relevant)
LOW_SUN		>=50%
LOW_PRESSURE OR WHITE_SCATTERER		never (not relevant)

(1) when the MER\_LRC\_2P pixel is composed of exactly 50% of one pixel type and 50% of another, the following priority rules must apply:

- 50% LAND & 50% WATER = LAND,
- 50% LAND & 50% CLOUD = CLOUD
- 50% WATER & 50% CLOUD = CLOUD

albedo_g[DDV_model, b]	Ground albedo for a DDV model at a given band	6.14	16	3	Land aerosols par.	DDV parameters for bi-directionality correction	9.3	2.6.23
AnomScatt_LUT[ $\theta_s, \theta_v, \Delta\phi, Chl$ ]	LUT giving threshold on reflectance at 560 nm for anomalous scattering	6.16	6	all	Ocean II par.	Anomalous Scattering Detection	8.5	2.9.6
aot_offset	offset - Aerosol optical thicken.	6.10	4	24	Level 2 control par.	General	10	2.10
aot_scale	scaling factor - Aerosol optical thicken.	6.10	4	10	Level 2 control par.	General	10	2.10
AOT <sub>p</sub>	Default aerosol optical depth	6.17	4	29	Cloud measurement par.	General	4.5	2.1b
APF_Junge_LUT[i]	APF of the Junge aerosol model nb 10	6.11	4	31	Atmosphere parameters	General	5.5	2.1c
$\alpha_{thresh}(b)$	Constant applying to threshold value derived from LUT. Allows to take into account environment and bathymetric effects	6.14	5	1,3	Land aerosols par.	Thresholds for inland waters processing	5	7.3.1
aw(b)	Absorption of pure water	6.16	4	12	Ocean II par.	General	8.3	2.6.8
B(b)	Constants for detection of yellow substance contaminated pixels	6.16	5	1	Ocean II par.	Case II yellow substance detection coeffs.	8.5	2.9
b_bright	Index of band for reflectance test	6.10	7	12	Level 2 control par.	Classification parameters	5	2.1

## MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
b_bright2	Index of band for test on TOA reflectance	6.10	7	10	Level 2 control par.	Classification parameters	5.5	2.1c
b_slope1_d	Index of denominator band for test 1	6.10	7	3	Level 2 control par.	Classification parameters	5	2.1
b_slope1_n	Index of numerator band for test 1	6.10	7	2	Level 2 control par.	Classification parameters	5	2.1
b_slope2_d	Index of denominator band for test 2	6.10	7	7	Level 2 control par.	Classification parameters	5	2.1
b_slope2_n	Index of numerator band for test 2	6.10	7	6	Level 2 control par.	Classification parameters	5	2.1
bb_775_ie(bs)	Initial estimate of backscatter at 775 for LOW and HIGH band estimate	6.16	4	23	Ocean II par.	General	8.3	2.6.8
bbp_init	Initial value of bbp to initialise rhow_bb_routine	6.16	4	28	Ocean II par.	General	8.3	2.6.8
bbp_star_c(b)	Specific back scattering of coccoliths	6.16	4	14	Ocean II par.	General	8.3	2.6.8
bbp_star_p(b)	Specific back scattering of particulates	6.16	4	15	Ocean II par.	General	8.3	2.6.8
bbp_tol	Convergence criteria on bbp in the BPAC iterations	6.16	4	18	Ocean II par.	General	8.3	2.6.8
bbw(b)	Back scattering of pure water	6.16	4	13	Ocean II par.	General	8.3	2.6.8
$\beta_L$	Threshold for in-land waters screening spectral slope test	6.14	4	6	Land aerosols par.	General	5	2.6.26
blue_band_N	Blue band index number	6.18	4	1	Land Vegetation Index par.	General	9.2	2.2
boavi_nir1_band	near infrared band #1 for BOAVI	6.18	4	11	Land Vegetation Index par.	General	9.4	2.8
boavi_nir2_band	near infrared band #2 for BOAVI	6.18	4	12	Land Vegetation Index par.	General	9.4	2.8
BOAVI_offset	offset - BOA Vegetation index	6.10	4	30	Level 2 control par.	General	10	2.10
BOAVI_RANGE[0..1]	Range limits for BOAVI	6.18	4	13	Land Vegetation Index par.	General	9.4	2.8
boavi_red_band	red band number for BOAVI	6.18	4	10	Land Vegetation Index par.	General	9.4	2.8
BOAVI_scale	scaling factor - BOA Vegetation index	6.10	4	16	Level 2 control par.	General	10	2.10

**MERIS Level 2 Parameters Data List**

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
$b_{\text{thresh}}(b)$	Indices of bands to be used for comparison with threshold within the island and in-land water screening	6.14	4	5	Land aerosols par.	General	5	2.6.16
$\beta_w$	Threshold on spectral slope used in island screening over waters	6.14	4	7	Land aerosols par.	General	5	2.6.26
ca_offset	offset - cloud albedo	6.10	4	31	Level 2 control par.	General	10	2.10
ca_scale	scaling factor - cloud albedo	6.10	4	17	Level 2 control par.	General	10	2.10
Calb_LUT [ $\mu_s, \mu_v, \Delta\phi, \alpha_{\text{surf}}, k$ ]	LUTs of polynomial coefficients for estimating cloud albedo as a function of geometry and surface albedo	6.17	6	all	Cloud measurement par.	Polynomial coefficients for cloud albedo retrieval	7	2.4
Chl_epsilon	Convergence criterium for iterative Chl calculation	6.15	7	2	Ocean 1 par.	log10 polynomial coefficients	8.5	2.9.7
Chl_offset	offset - Algal pigment index	6.10	4	20	Level 2 control par.	General	10	2.10
Chl_scale	scaling factor - Algal pigment index	6.10	4	6	Level 2 control par.	General	10	2.10
Chl <sub>0</sub>	initial algal pigment index value	6.15	4	13	Ocean 1 par.	General	8.5	2.9.7
Chl <sub>thresh</sub> rangeout	Chl1 range thresholds for validity of output	6.15	6	2	Ocean 1 par.	Thresholds	8.5	2.9.7
CLIMATO_AUX	Switch to activate the use of a climatology	6.10	6	22	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
Cloud_wv_LUT [ $\mu_s, \mu_v, \Delta\phi, \delta, \alpha, k$ ]	LUTs of polynomial coefficients water vapour retrieval over cloud	6.12	8	all	Water vapour par.	Polynomial coefficients for water vapoure retrieval over clouds	6	2.3
CMOY	Mean value of chlorophyll	6.15	4	21	Ocean 1 par.	General	8.4	2.6.9
Cnorm_LUT[month, lat, lon, band]	DDV reflectance monthly adjustment factors	6.14	18	1	Land aerosols par.	DDV Reflectance Correction Parameters	9.3	2.6.17.3
Const_rho[Class][band]	rho <sub>i</sub> normalisation parameters for blue, red, and NIR channels and for Vegetated and Bright soils	6.18	4	6	Land Vegetation Index par.	General	9.2	2.2

## MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
cot_offset	offset - Cloud optical thickness	6.10	4	25	Level 2 control par.	General	10	2.10
cot_scale	scaling factor - Cloud optical thickness	6.10	4	11	Level 2 control par.	General	10	2.10
Cthick_LUT [ $\mu_s, \mu_v, \Delta\phi, \alpha_{surf}, k$ ]	LUTs of polynomial coefficients for estimating cloud optical thickness as a function of geometry and surface albedo	6.17	7	all	Cloud measurement par.	Polynomial coefficients for cloud optical thickness retrieval	7	2.4
ctp_offset	offset - cloud top pressure	6.10	4	32	Level 2 control par.	General	10	2.10
ctp_scale	scaling factor - cloud top pressure	6.10	4	18	Level 2 control par.	General	10	2.10
Ctype_δ <sub>c</sub> _range [1..Ctype_n_δ <sub>c</sub> ]	range of optical thickness values for cloud type classification	6.17	4	21	Cloud measurement par.	General	7	2.4
Ctype_LUT [δ <sub>c</sub> , P <sub>top</sub> ]	LUT of cloud type index	6.17	10	all	Cloud measurement par.	Cloud type index	7	2.4
Ctype_n_δ <sub>c</sub>	number of optical thickness values for cloud type classification	6.17	4	23	Cloud measurement par.	General	7	2.4
Ctype_n_P	number of pressure values for cloud type classification	6.17	4	22	Cloud measurement par.	General	7	2.4
Ctype_P_range [1..Ctype_n_P]	range of pressure values for cloud type classification	6.17	4	20	Cloud measurement par.	General	7	2.4
ΔARVI <sub>max</sub> _LUT[month, lat, lon]	Maximum acceptable value for ΔARVI	6.14	18	3	Land aerosols par.	DDV Reflectance Correction Parameters	9.3	2.6.17.3
ΔARVI <sub>min</sub> _LUT[month, lat, lon]	Minimum acceptable value for ΔARVI	6.14	18	3	Land aerosols par.	DDV Reflectance Correction Parameters	9.3	2.6.13
DDV_ARVI_LUT[θ <sub>s</sub> , θ <sub>v</sub> , Δφ, DDV_model]	ARVI threshold used for DDV screening	6.14	6	all	Land aerosols par.	ARVI thresholds for DDV models	9.3	2.6.23
DDV_Bands[3]	List of band indices to be used for step 2.6.17-3	6.14	4	20	Land aerosols par.	General	9.3.3	2.6.17
DDV_clim [lat, lon]	Climatological table to select biome according to location	6.14	15	all	Land aerosols par.	DDV climatology	9.3	2.6.23

MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
DDV_LUT [biome, month]	Climatological table to select DDV model according to biome and season	6.14	4	12	Land aerosols par.	General	9.3	2.6.23
DDV_Slope_LUT[month, lat, lon, band]	DDV reflectance linear correction factors	6.14	18	2	Land aerosols par.	DDV Reflectance Correction Parameters	9.3	2.6.17.3
DDV_THR_LUT[ $\theta_s, \theta_v, \Delta\phi$ , DDV_model, b]	DDV reflectances at 4 bands as function of geometry and DDV model	6.14	7	all	Land aerosols par.	Standard surface reflectance ranges for DDV models	9.3	2.6.23
DEPTH_LIM	threshold on depth to signal the "shallow water flag"	6.10	6	12	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
DRO510_LIM	Value of $\Delta\rho_{510}$ to set the annotation flag	6.15	4	23	Ocean 1 par.	General	8.4	2.6.9
DRO510_threshold_D	Threshold for absorbing aerosol test at 510 nm	6.10	6	2	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
DRO705_threshold_B	Threshold for blue aerosol test at 510 nm	6.10	6	3	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
Dsun <sub>0</sub> <sup>2</sup>	Square of Sun-Earth distance at reference date	6.10	5	1	Level 2 control par.	Smile Effect Correction	3	2.1.4
$\Delta\tau_a$	Increment in optical thickness used within the iterative procedure	6.14	4	11	Land aerosols par.	General	9.3	2.6.23, 2.6.17
E <sup>P</sup> <sub>CTP</sub>	Solar flux reference value at b753 consistent with CTP NN	6.17	4	8 (1 <sup>st</sup> element)	Cloud measurement par.	General	4.5	2.1b
E <sup>P</sup> <sub>ratio</sub>	Solar flux ratio, consistent with CTP NN, to convert reflectance ratio into normalised radiance ratio	6.17	4	8 (2 <sup>nd</sup> element)	Cloud measurement par.	General	4.5	2.1b
epsilon_offset	offset - epsilon	6.10	4	23	Level 2 control par.	General	10	2.10
epsilon_scale	scaling factor - epsilon	6.10	4	9	Level 2 control par.	General	10	2.10
f <sub>over_q1</sub> _LUT[b, $\theta_p, \theta_s, \Delta\phi, C_{hl}, \tau_a, W_s$ ]	bidirectional factor f/Q	6.15	8	all	Ocean 1 par.	f/Q factor	8.4, 8.5	2.6.9, 2.9
f0_LUT[b, chl]	f0 factor	6.15	11	all	Ocean 1 par.	f0 factor	8.5	
F <sub>0</sub> (b)	Solar irradiance spectrum at reference wavelength, bandwidth and date	6.10	5	7	Level 2 control par.	Smile Effect Correction	5	2.1.9

## MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
$F_0^C(b753)$	Solar flux at 753.75nm for cloud LUTs	6.17	4	24	Cloud measurement par.	General	4	2.1
$F_0^{FR}(b,k)$	Extra-terrestrial Sun irradiance at reference date for all MERIS FR detectors and band	6.10	5	11	Level 2 control par.	Smile Effect Correction	3	2.1.4
$F_0^{RR}(b,k)$	Extra-terrestrial Sun irradiance at reference date for all MERIS RR detectors and band	6.10	5	9	Level 2 control par.	Smile Effect Correction	3	2.1.4
$F_0^{WV}(b)$	Solar flux consistent with Cloud LUTs	6.12	4	7	Water vapour par.	General	6.5	2.3
fatab_LUT [ja, b]	Lookup Table for the aerosol forward scattering probability	6.13	8	all	Ocean aerosols par.	Aerosols scattering probability	8.4	2.6.9
Fp_LUT [0s, $\theta_v$ , $\Delta\phi$ , Ws, coeff, b]	LUT of coefficients of F' to IOPs relation	6.16	7	all	Ocean II par.	Coefficients of F' to IOPs relation	8.3	2.6.8
fresnel_Coeff_LUT[i]	Fresnel coefficients	6.11	4	32	Atmosphere parameters	General	5.5	2.1c
$f_{SL}$	Correction factor for residual stray-light in band 11	6.17	4	16 (FR) & 17 (RR)	Cloud measurement par.	General	4.5	2.1b
FSURQ_0	Value of F/Q factor at 510 nm for nadir angle	6.15	4	20	Ocean 1 par.	General	8.4	2.6.9
$\gamma$	Gamma coefficient used in ARVI computation	6.14	4	10	Land aerosols par.	General	9.3	2.6.23, 2.6.13
gain_vicarious(b)	Vicarious adjustment gains	6.13	4	7	Ocean aerosols par.	General	8.2	2.6.5.5
H <sub>2</sub> O <sub>705</sub> Corr_Poly_LUT[ $\Delta\lambda$ , k]	Polynomial coefficients for H <sub>2</sub> O transmission correction at 709nm (b705)	6.11	6	2	Atmosphere parameters	H2O Transmission	5	2.6.12.3
Hp	pressure scale height	6.11	4	28	Atmosphere parameters	General	3	2.1.0
init_ang	Initial estimate of the Angström exponent	6.16	4	24	Ocean II par.	General	8.3	2.6.8
INV_WV	Threshold value on radiance at 885 nm for marking a pixel as invalid for water vapour processing	6.12	4	4	Water vapour par.	General	6	2.3
InvAbs_Ch12[4]	Conversion factors for Ch12	6.16	4	10	Ocean II par.	GADS General	8.5	2.9.11
InvScat_SPM	Conversion factors for SPM	6.16	4	11	Ocean II par.	GADS General	8.5	2.9.11
K_toavi[Class][band]	K <sub>i</sub> normalisation parameters for blue, red, and NIR channels and for Vegetated and Bright soils	6.18	4	4	Land Vegetation Index par.	General	9.2	2.2

MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
$\lambda(b)$	Wavelength for a given band number	5.3.1.4	4	31	Level 1 SPH	SPH	9.3	2.6.23, 2.6.17
L[set][order]	polynomial coefficients used for the polynomial ratios of reflectance rectification and TOAVI	6.18	4	8	Land Vegetation Index par.	General	9.2	2.2
LandRefCorr_b(b,i)	array of pairs of band indices for estimation of reflectance spectral derivative (Land pixels)	6.10	5	4	Level 2 control par.	Smile Effect Correction	7	2.1.6
LandRefCorr_sw(b)	array of per band switches enabling Smile Effect Correction for Land pixels reflectance	6.10	5	2	Level 2 control par.	Smile Effect Correction	6	2.1.6
$\lambda_{761}^C(\text{detector})$	band 11 wavelength optimised for pressure retrievals	6.17	4	14 (FR) & 15 (RR)	Cloud measurement par.	General	4.5	2.1b
LIST_BLUE	list of blue aerosol models	6.10	6	8	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9.2.5
LISTE_aer_01(5)	List of aerosol models indices	6.10	6	4	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
LISTE_aer_02(5)	List of aerosol models indices	6.10	6	4	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
LISTE_aer_03(5)	List of aerosol models indices	6.10	6	4	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
LISTE_aer_04(5)	List of aerosol models indices	6.10	6	4	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
LISTE_aer_05(5)	List of aerosol models indices	6.10	6	4	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
Ln_min_705	Minimum normalised radiance measurable by MERIS at b705	6.16	4	27	Ocean II par.	General	8.3	2.6.8
log10coeff_LUT [p]	Polynomial coefficients for Algal Pigment Index retrieval in Case 1 waters	6.15	7	1	Ocean 1 par.	log10 polynomial coefficients	8.5	2.9.7
$\lambda_{\text{pix}}^{\text{FR}}(b,k)$	Central wavelengths for each MERIS FR detector and band	6.10	5	10	Level 2 control par.	Smile Effect Correction	4, 5	2.1.3, 2.1.5, 2.1.7, 2.6.12, 2.1.6
$\lambda_{\text{pix}}^{\text{RR}}(b,k)$	Central wavelengths for each MERIS RR detector and band	6.10	5	8	Level 2 control par.	Smile Effect Correction	4, 5	2.1.3, 2.1.5, 2.1.7, 2.6.12, 2.1.7
$\lambda_{\text{ref}}(\Delta\lambda)$	Spectral shift reference wavelength grid	6.11	4	26	Atmosphere parameters	General	4	2.1.3

## MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
$\lambda_{ref}[b, \Delta\lambda]$	Reference wavelengths wavelength grids for correction coefficients of H2O at 709nm and O2 at 779nm	6.11	4	27 for b705, 26 for b761	Atmosphere parameters	General	5	2.6.12.3
$\lambda_{ref\_O2}$	Reference wavelength values for the Pscatt and P1 LUTs	6.11	4	26	Atmosphere parameters	General	5.5	2.1c
$\lambda_{theo}(b)$	Theoretical wavelengths corresponding to smile corrected reflectances	6.10	5	6	Level 2 control par.	Smile Effect Correction	5, 8.3, 8.4	2.1.6, 2.1.7, 2.6.8, 2.6.9, 2.6.10
MAX_PRESSURE	Maximum acceptable value for pressure	6.11	4	21	Atmosphere parameters	General	4	2.1
Max_rho[3]	Maximum acceptable TOA reflectances (1 coefficient for each blue, infrared and near infrared band)	6.18	4	7	Land Vegetation Index par.	General	9.2	2.2
Max_ $\tau_a$	Maximal optical thickness allowed within the iterative procedure	6.10	4	4	Level 2 control par.	General	9.3	2.6.23, 2.6.17
MAX_TAU_AER	maximum value for aerosol optical thickness	6.10	6	11	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
max_TOARb753	Maximum acceptable value for TOAR(b753)	6.17	4	10	Cloud measurement par.	General	4	2.1
max_TOARb761	Maximum acceptable value for TOAR(b761)	6.17	4	12	Cloud measurement par.	General	4	2.1
MDSI_Thresh	Threshold on MDSI	6.10	7	1	Level 2 control par.	Classification parameters	5.5	2.1c
min_R_ratio, max_R_ratio	Irradiance reflectance ratio validity range for Algal 1 computation using log10 polynomial	6.15	7	3	Ocean 1 par.	log10 polynomial coefficients	8.5	2.9.7
min_TOARb753	Minimum acceptable value for TOAR(b753)	6.17	4	9	Cloud measurement par.	General	4	2.1
min_TOARb761	Minimum acceptable value for TOAR(b761)	6.17	4	11	Cloud measurement par.	General	4	2.1
N_aer	Number of aerosol models in database	6.10	6	5	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
N_basic_aer	Number of aerosol models per lists	6.10	6	21	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9

**MERIS Level 2 Parameters Data List**

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
N_co	Number of coefficients in XCTab	6.10	6	7	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
N_PASSTOT	Number of passes within aerosol database	6.10	6	6	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
N1, N2, N3	Exponents used in step 2.9.4	6.16	5	5	Ocean II par.	Case II yellow substance detection coefficients	8.5	2.9.4
N <sub>A1</sub>	highest order of coefficients to use in log10coeff LUT	6.15	7	4	Ocean 1 par.	log10 polynomial coefficients	8.5	2.9.7
N Fp coeff	Number of coefficient for fitting the F' function	6.16	4	2	Ocean II par.	General	8.3	2.6.8
nir_band_N	Near infrared band index number	6.18	4	3	Land Vegetation Index par.	General	9.2	2.2
Niter	Number of iterations for Chl1 calculation	6.10	4	1	Level 2 control par.	General	8.5	2.9.7
Niter_rhow_bb	Number of iterations in the rhow_to_bb routine	6.16	4	20	Ocean II par.	General	8.3	2.6.8
NIterBPAC(bs)	Number of iterations in BPAC for band set LOW and band set HIGH	6.16	4	16	Ocean II par.	General	8.3	2.6.8
NN_Log_Switch	Switch enabling the reflectance log scaling at NN input	6.16	8	2	Ocean II par.	Case 2 neural network	8.5	2.9.11
NN_min_rho, NN_min_log_rho	Floor values for NN inputs [reflectance threshold, floor NN input]	6.16	4	31	Ocean II par.	General	8.5	2.9.11
NN_USE_SHIFT	Switch to use spectral shift as NN input	6.17	4	13	Cloud measurement par.	General	4	2.1
ODOC_offset	offset - Yellow substance	6.10	4	21	Level 2 control par.	General	10	2.10
ODOC_scale	scaling factor - Yellow substance	6.10	4	7	Level 2 control par.	General	10	2.10
OUT_MAX	Maximum acceptable output value	6.12	4	6	Water vapour par.	General	6	2.3
OUT_MIN	Minimum acceptable output value	6.12	4	5	Water vapour par.	General	6	2.3
P <sub>1</sub> _Thresh	Apparent pressure threshold over Land	6.10	7	16	Level 2 control par.	Classification parameters	5.5	2.1c
par_LUT [angstrom, U <sub>O3</sub> , τ <sub>aer</sub> (865), W <sub>T</sub> ]	LUT giving PAR	6.11	13	all	Atmosphere parameters	Photosynthetically available radiation	8.5	2.9

MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
PAR_offset	offset - PAR	6.10	4	28	Level 2 control par.	General	10	2.10
PAR_scale	scaling factor - PAR	6.10	4	14	Level 2 control par.	General	10	2.10
press_offset	offset - Surface pressure	6.10	4	26	Level 2 control par.	General	10	2.10
press_scale	scaling factor - Surface pressure	6.10	4	12	Level 2 control par.	General	10	2.10
PRESS_TOLERANCE	Threshold to activate a correction for pressure	6.10	6	19	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
pressLevel	Reference pressure levels for TO2_Atm_LUT	6.11	4	30	Atmosphere parameters	General	5.5	2.1c
P <sub>scatt</sub> _Thresh	Apparent pressure threshold over Water	6.10	7	17	Level 2 control par.	Classification parameters	5.5	2.1c
P <sub>Smin</sub> , P <sub>Smax</sub>	Validity range for surface pressure NN output	6.17	4	27 & 28	Cloud measurement par.	General	4.5	2.1b
Pstd	Standard pressure	6.11	4	19	Atmosphere parameters	General	5, 8.2, 8.3, 8.4, 9.3	2.1, 2.6.5.1, 2.6.23, 2.6.9, 2.6.10, 2.9
P <sub>thresh</sub>	Threshold value for low pressure water	6.11	4	16	Atmosphere parameters	General	8.2	7.3.1
θ <sub>ref_O2</sub>	Reference zenith angle values for the Pscatt and P1 LUTs	6.11	4	29	Atmosphere parameters	General	5.5	2.1c
ρ <sub>diff_min1</sub>	Minimum value of the top of aerosol reflectance difference between near infrared #1 and red bands to allow MTCI computation	6.18	4	17	Land Vegetation Index par.	General	9.4	2.8
ρ <sub>diff_min2</sub>	Minimum value of the top of aerosol reflectance difference between near infrared #3 and red bands to allow MTCI computation	6.18	4	18	Land Vegetation Index par.	General	9.4	2.8
ρ <sub>nir2_min</sub>	Minimum value of top of aerosol reflectance in near infrared band #2 to allow MTCI computation	6.18	4	15	Land Vegetation Index par.	General	9.4	2.8
ρ <sub>nir2_min</sub>	Minimum value of top of aerosol reflectance in near infrared band #2 to allow MTCI computation	6.18	4	16	Land Vegetation Index par.	General	9.4	2.8

**MERIS Level 2 Parameters Data List**

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
$\rho_{red\_max}$	Maximum value of top of aerosol reflectance in red band to allow MTCI computation	6.18	4	14	Land Vegetation Index par.	General	9.4	2.8
$R_{10\_12\_thresh}$	Minimum b10-b12 spectral slope value to consider apparent pressure over water	6.10	7	19	Level 2 control par.	Classification parameters	5.5	2.1c
$R_{865\_CS}$	Reflectance threshold at 865 nm to screen out cloud shadow from DDV pixels	6.14	4	18	Land aerosols par.	General	9.3.3	2.6.13
$R_{865\_CS}$	Reflectance threshold to screen out cloud shadow from DDV pixels	6.14	4	21	Land aerosols par.	General	9.3	2.6.13
$R_{ayalb\_LUT}[\tau]$	Rayleigh spherical albedo as a function of optical thickness	6.11	8	all	Atmosphere parameters	Rayleigh spherical albedo	9.3	2.6.23
$R_{ayscatt\_coef\_LUT}[\theta_s, \theta_v, s, k]$	LUT of polynomial coefficients for the 3 Fourier series terms used to compute the correction factor for Rayleigh multiple scattering	6.11	7	all	Atmosphere parameters	Rayleigh scattering function	5	2.1
$Rect\_rho\_offset[b]$	Offset for rectified reflectances in infrared and near infrared bands	6.10	4	34,36	Level 2 control par.	GADS General	10.5.9	2.10.10
$Rect\_rho\_scale[b]$	Scaling factor for rectified reflectances in red and near infrared bands	6.10	4	33,35	Level 2 control par.	GADS General	10.5.9	2.10.10
$red\_band\_N$	Red band index number	6.18	4	2	Land Vegetation Index par.	General	9.2	2.2
$reflect\_offset$	offset - reflectances	6.10	4	19	Level 2 control par.	General	10	2.10
$reflect\_scale$	scaling factor - reflectances	6.10	4	5	Level 2 control par.	General	10	2.10
$\rho_{Ground665\_Threshold}$	665nm ground reflectance threshold for iterative aerosol identification	6.14	4	19	Land aerosols par.	General	9.3.3	2.6.17
$r_{ghot\_LUT}[\theta_p, W_s]$	LUT for the ocean-atmosphere reflection factor	6.15	5	all	Ocean 1 par.	Geometrical factor R	8.3, 8.4.3.13.6	2.6.10, 2.6.9
$Rho\_rc\_LUT[k, \theta_s, \theta_v, \Delta\phi]$	LUT of thresholds on Rayleigh corrected reflectance at 442nm	6.10	8	all	Level 2 control par.	Reflectance thresholds	5	2.1
$\rho_{753\_thresh}$	Minimum b10 reflectance value to consider apparent pressure over land	6.10	7	18	Level 2 control par.	Classification parameters	5.5	2.1c
$\rho_{TOA\_thresh}$	Threshold on TOA reflectance at band b_bright2	6.10	7	11	Level 2 control par.	Classification parameters	5.5	2.1c
$\rho_{how\_bb\_tol}$	Convergence criteria on bb in the $\rho_{how\_to\_bb}$ routine	6.16	4	19	Ocean II par.	General	8.3	2.6.8

MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
robar_ag_LUT[s, b, iaer, DDV_model, $\theta_s$ , $\theta_v$ ]	Look-up table of the five Fourier serie terms for the BRDF aerosol ground coupling term	6.14	16	2	Land aerosols par.	DDV parameters for bi-directionality correction	9.3	2.6.17
robar_ra_LUT[k,iaer, $\theta$ ]	Look-up table of the four polynomial order terms for the BRDF rayleigh aerosol coupling term	6.14	17	1	Land aerosols par.	Aerosol parameters for bi-directionality correction	9.3	2.6.17
robar_rg_LUT [b, DDV_model, $\theta$ ]	Look-up table of the BRDF rayleigh ground coupling term	6.14	16	1	Land aerosols par.	DDV parameters for bi-directionality correction	9.3	2.6.17
ROG_LUT[ $\theta_s$ , $\theta_v$ , $\Delta\phi$ , $W_s$ , chiw]	LUT containing glint reflectance as a function of geometry, wind speed and direction	6.15	9	all	Ocean 1 par.	Glint reflectance	8.2	2.6.5.1
ROW_510_MEAN_LUT	Climatology giving mean $\rho_w$ at 510nm	6.15	10	1	Ocean 1 par.	Mean $\rho_w$ at 510nm	8.4	2.6.9.2.3
row_510_sigma_LUT	Climatology giving $\rho_w$ variability at 510nm	6.15	10	2	Ocean 1 par.	Mean $\rho_w$ at 510nm	8.4	2.6.9.2.4
row_775_do_both_th	Threshold on rhow at 775 to activate the HIGH bandset	6.16	4	25	Ocean II par.	General	8.3	2.6.8
row_775_do_high_th	Threshold on rhow at 775 to deactivate the LOW bandset	6.16	4	26	Ocean II par.	General	8.3	2.6.8
ROW9_LUT [ $\theta_s, \theta_v, \Delta\phi$ ]	LUT for threshold value on TOA $\rho_w$ in channel 9	6.15	6	8	Ocean 1 par.	Thresholds	8.3	2.6.8
$\rho_{Rtab}$ _LUT [ $W_s, b, \theta_s, \theta_v, \Delta\phi$ ]	LUT for the Rayleigh reflectance	6.11	12	all	Atmosphere parameters	Rayleigh reflectance over ocean	8.3	2.6.8
$\rho_{thresh}$ _LUT[b, $\theta_s, \theta_v, \Delta\phi$ ]	LUT containing threshold values for inland and inland waters screening	6.14	5	2,4	Land aerosols par.	Thresholds for inland waters processing	5	2.6.11, 2.6.30
$\rho_{w5thresh}$ rangein	$\rho_w(b5)$ threshold for controlling validity of input to Chl1 algorithm	6.15	6	1	Ocean 1 par.	Thresholds	8.5	2.9.6
RWNEG_threshold(b)	Reflectance thresholds to set the negative reflectanceflag	6.10	6	1	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
SA_LUT[ $\tau_a, iaer$ ]	Look-up table of aerosol spherical albedo	6.14	8	all	Land aerosols par.	Aerosol spherical albedo	9.3	2.6.23, 2.6.17
SATURATION_L[b]	Default radiance for saturated pixels	6.10	4	3	Level 2 control par.	GADS General	5.5.6, 10.5.6	2.1.7, 2.10.6
Slope_1_high	Upper limit of slope range for test 1	6.10	7	5	Level 2 control par.	Classification parameters	5	2.1
Slope_1_low	Lower limit of slope range for test 1	6.10	7	4	Level 2 control par.	Classification parameters	5	2.1

## MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
Slope_2_high	Upper limit of slope range for test 2	6.10	7	9	Level 2 control par.	Classification parameters	5	2.1
Slope_2_low	Lower limit of slope range for test 2	6.10	7	8	Level 2 control par.	Classification parameters	5	2.1
specdep [aer, $\tau$ , b]	LUT of the spectral dependence of the aerosol optical thickness for the various aerosol assemblages	6.13	5	all	Ocean aerosols par.	Spectral optical thickness	8.4	2.6.9
SPM_Case2_Thresh	Threshold on SPM concentration to identify sediment dominated waters	6.16	4	17	Ocean II par.	General	8.3	2.6.8
SPM_offset	offset - Suspended particulate matter	6.10	4	22	Level 2 control par.	General	10	2.10
SPM_scale	scaling factor - Suspended particulate matter	6.10	4	8	Level 2 control par.	General	10	2.10
SP <sub>NN</sub> _min, SP <sub>NN</sub> _max	Validity ranges for surface pressure NN inputs	6.17	4	25 & 26	Cloud measurement par.	General	4.5	2.1b
STRAT_CORR	Switch to perform stratospheric aerosol correction	6.10	4	2	Level 2 control par.	General	4, 5	2.1.9
Strato_aerpha_LUT [cos $\theta$ scat, i_eff_radius, band]	Aerosol phase function times single scattering albedo values as a function of cosine of scattering angle and effective radius index	6.14	14	1	Land aerosols par.	Stratospheric aerosol reflectance parameters	5	2.1.9
Strato_multi [iaer_sa]	Table of index in multiple scattering LUT for strato. aerosol	6.14	4	16	Land aerosols par.	General	5	2.1.9
Strato_rad [iaer_sa]	Table of effective radius index for strato. aerosol	6.14	4	15	Land aerosols par.	General	5	2.1.9
Strato_spectr [i_eff_radius, band]	Table of spectral dependency of optical thickness as a function of stratospheric aerosol effective radius	6.14	14	2	Land aerosols par.	Stratospheric aerosol reflectance parameters	5	2.1.9
Strato_sphalb [iaer_sa, b]	Look-up table of stratospheric aerosol spherical albedo	6.14	12	all	Land aerosols par.	Stratospheric aerosol spherical albedo	5	2.1.9
Strato_tau [ iaer_sa]	Table of optical thickness at a reference band for strato. aerosol	6.14	4	17	Land aerosols par.	General	5	2.1.9
Stratospheric_LUT [lat,lon]	LUT of stratospheric aerosol model as a function of latitude, longitude	6.7	7	all	Aerosol Climatology	Stratospheric aerosol	4	2.1.9
Surface_Confidence_Map[lat, lon]	Atlas map for confidence on a priori surface type (land/water) knowledge	6.19	all	all	Surface Confidence Map par.	all	5	2.6.26

MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
Surfalb_b11_LUT [lat,lon,month]	LUT of surface albedo at b761 as a function of latitude, longitude and month of year	6.17	5	all	Cloud measurement par.	Surface Albedo at 761 nm	7.5	2.4
Surfalb_b14_LUT [lat,lon,month]	Surface albedo at b885 LUT	6.12	11	all	Water vapour par.	Surface Albedo at 885 nm	6.5	2.3
$t_0, t_1, t_2$	Rayleigh transmittance coefficients	6.11	4	1	Atmosphere parameters	General	9.3	2.6.23
$\tau_a$ _bl865 [aer, $\tau$ ]	Aerosol optical thickness at 865 (boundary layer) for the N_aer aerosol assemblages and N_ $\tau$ values	6.13	6	all	Ocean aerosols par.	Aerosol optical thickness of the boundary layer	8.4	2.6.9
TA_LUT[ $\theta, \tau_a, iaer$ ]	Look-up table of aerosol transmittance	6.14	9	all	Land aerosols par.	Aerosol transmittance	9.3	2.6.23, 2.6.17
TA_Strato_LUT [iaer_sa, band, $\theta$ ]	Look-up table of stratospheric aerosol transmittance	6.14	13	all	Land aerosols par.	Stratospheric aerosol transmittance	5	2.1.9
TAUA865_threshold	Threshold for the aerosol optical thickness	6.10	6	15	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
$t_{down}$ _LUT[ia, b, $\mu_s, \tau_a$ _865, Ws]	LUT for downward diffuse transmittance	6.13	11	all	Ocean aerosols par.	Downward Transmittance	8.4	2.6.9
TEST_AER	Switch indicating if the tests concerning the possible presence of absorbing aerosols are carried out (switch = TRUE) or not (switch = FALSE)	6.10	6	16	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4	2.6.9
TETAP_ZENITH	Value of $\theta_p$ for nadir viewing	6.15	4	24	Ocean 1 par.	General	8.4	2.6.9
TETAS_limit	Value of the sun zenith angle above which the annotation flag is modified	6.10	6	17	Level 2 control par.	Atmospheric corrections for Case 1 waters	8.4 , 10	2.6.9, 2.10
Theta_toavi[Class][band]	theta_i normalisation parameters for blue, red, and NIR channels and for Vegetated and Bright soils	6.18	4	5	Land Vegetation Index par.	General	9.2	2.2
thres_lowg	Threshold value for low glint	6.15	6	5	Ocean 1 par.	Thresholds	8.2	2.6.5.1
thres_medg	Upper threshold value for ratio between glint and TOA reflectance	6.15	6	6	Ocean 1 par.	Thresholds	8.2	2.6.5.1
Thres_WVhg	Water Vapour high glint threshold	6.15	6	9	Ocean 1 par.	Thresholds	8.2	2.6.5
Thresh_BlueROGC_LUT [ $\theta_s, \theta_v, \Delta\phi$ ]	Bright threshold on Glint corrected reflectance at 412 nm	6.13	9	all	Ocean aerosols par.	Blue ROGC Threshold	8.2	2.6.5.4
Thresh_nir2red_ref	Infrared to near infrared reflectance maximum ratio	6.18	4	9	Land Vegetation Index par.	General	9.2	2.2

MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
TO2_Atm_Aer_LUT[ $\lambda, \theta_s, \theta_v$ ]	O2 aerosol atmospheric transmittance for Ha=2km	6.11	10	2	Atmosphere parameters	Apparent Pressure Parameters	5.5	2.1c
TO2_Atm_LUT[ $\lambda_{761}, \text{layer}, \theta_s, \theta_v$ ]	O2 atmospheric transmittance LUT	6.11	10	4	Atmosphere parameters	Apparent Pressure Parameters	5.5	2.1c
TO2_Fresnel_LUT[ $\lambda, \theta_s, \theta_v$ ]	O2 Aerosol Fresnel transmittance	6.11	10	3	Atmosphere parameters	Apparent Pressure Parameters	5.5	2.1c
TO2_LUT[ $\lambda^{775}, L_N^{775}, \theta_s, \theta_v, \Delta\phi$ ]	LUT for O2 correction at 779	6.11	9	all	Atmosphere parameters	O2 transmission around 779	4	2.1
TO2_Ray_LUT[ $\lambda, \theta_s, \theta_v$ ]	O2 Rayleigh transmittance	6.11	10	1	Atmosphere parameters	Apparent Pressure Parameters	5.5	2.1c
$\tau_{O3\_norm}(b)$	Ozone optical thickness corresponding to 1cm.atm for all bands	6.11	5	5	Atmosphere parameters	Optical thicknesses	5	2.6.12.1
TOAVI_offset	offset - TOA Vegetation index	6.10	4	29	Level 2 control par.	General	10	2.10
TOAVI_scale	scaling factor - TOA Vegetation index	6.10	4	15	Level 2 control par.	General	10	2.10
$\tau_R(b)$	Rayleigh optical thickness at standard pressure for all bands	6.11	5	4	Atmosphere parameters	Optical thicknesses	5, 8.2, 8.3, 8.4, 9.3	2.1, 2.6.5.1, 2.6.8, 2.6.10, 2.6.9, 2.6.23, 2.9
tup_LUT [ia, b, $\mu_v$ , ta_865]	LUT for upward diffuse transmittance	6.13	12	all	Ocean aerosols par.	Upward Transmittance	8.4	2.6.9
WAT_REF_IND	Water refraction index	6.15	4	22	Ocean 1 par.	General	8.3, 8.4, 8.5	2.6.10, 2.6.9, 2.9
$\omega_a \text{tab\_LUT}$ [ia, b]	LUT for the aerosol single scattering albedo for the N_aer aerosol assemblages and the N_wl bands	6.13	7	all	Ocean aerosols par.	Aerosol single scattering albedo	8.4	2.6.9
Water_noglint_wv_LUT [ $\mu_s, \mu_v, \Delta\phi, \delta, w, k$ ]	LUTs of polynomial coefficients for water vapour retrieval over water without glint	6.12	6	all	Water vapour par.	Polynomial coefficients for water vapour retrieval over ocean when there is no glint	6	2.3.2
WaterRefCorr_b(b,i)	array of pairs of band indices for estimation of reflectance spectral derivative (Water pixels)	6.10	5	5	Level 2 control par.	Smile Effect Correction	9	2.1.6
WaterRefCorr_sw(b)	array of per band switches enabling Smile Effect Correction for Water pixels reflectance	6.10	5	3	Level 2 control par.	Smile Effect Correction	8	2.1.6

## MERIS Level 2 Parameters Data List

PO-TN-MEL-GS-0006  
Issue 8.0B ; 24 June 2011

Variable	Descriptive Name	IODD section	IODD table	Param #	Product	ADS	DPM section	Algorithm step
WHITECAP_THR	wind speed threshold for whitecaps	6.15	6	7	Ocean 1 par.	Thresholds	8.2	7.3.1
wv_offset	offset - Water vapour	6.10	4	27	Level 2 control par.	General	10	2.10
wv_scale	scaling factor - Water vapour	6.10	4	13	Level 2 control par.	General	10	2.10
WVNN_INmax	Maximum valid values for Neural Net inputs	6.12	4	18	Water vapour par.	General		
WVNN_INmin	Minimum valid values for Neural Net inputs	6.12	4	17	Water vapour par.	General		
WVNN_OUTmax	Maximum valid value for Neural Net output	6.12	4	20	Water vapour par.	General		
WVNN_OUTmin	Minimum valid value for Neural Net output	6.12	4	19	Water vapour par.	General		
XCTab_LUT [k, W <sub>s</sub> , ia, b, θ <sub>s</sub> , θ <sub>v</sub> , Δφ ]	LUT for polynomial coefficients linking the ratio ρ <sub>path</sub> /ρ <sub>R</sub> to the aerosol optical thickness	6.13	10	all	Ocean aerosols par.	Coefficients of (ρ <sub>T</sub> /ρ <sub>R</sub> ) to τ <sub>a</sub> relation	8.4	2.6.9
YS_thresh	Threshold for flagging YS dominated waters	6.16	4	29	Ocean II par.	General	8.5	2.9
Z <sub>max</sub> _INLAND	Altitude threshold above which inland water screening is disabled	6.14	5	5	Land aerosols par.	Thresholds for inland waters processing
