

Time series analysis of mountain snow cover from MODSCAG and VIIRSCAG

Kat J. Bormann, Karl Rittger &
Thomas H. Painter

Contents

1. Background
2. Introduction to VIIRS instrument
3. VIIRS snow cover products
4. Evaluation of VIIRS products*
5. Snow metrics derived from satellite retrievals
6. Time series of metrics
7. Long term monitoring implications

Background

- MODIS-derived products have become the workhorse for snow cover monitoring
- 15 year time series

Introduction to VIIRS

- Visible Infrared Imaging Radiometer Suite
- Successor instrument to MODIS
 - Spatial resolution 375m (n=3), 750m (n=7)
 - Slightly different bandwidths
 - Different handling of along-scan ground sampling at high scan angles

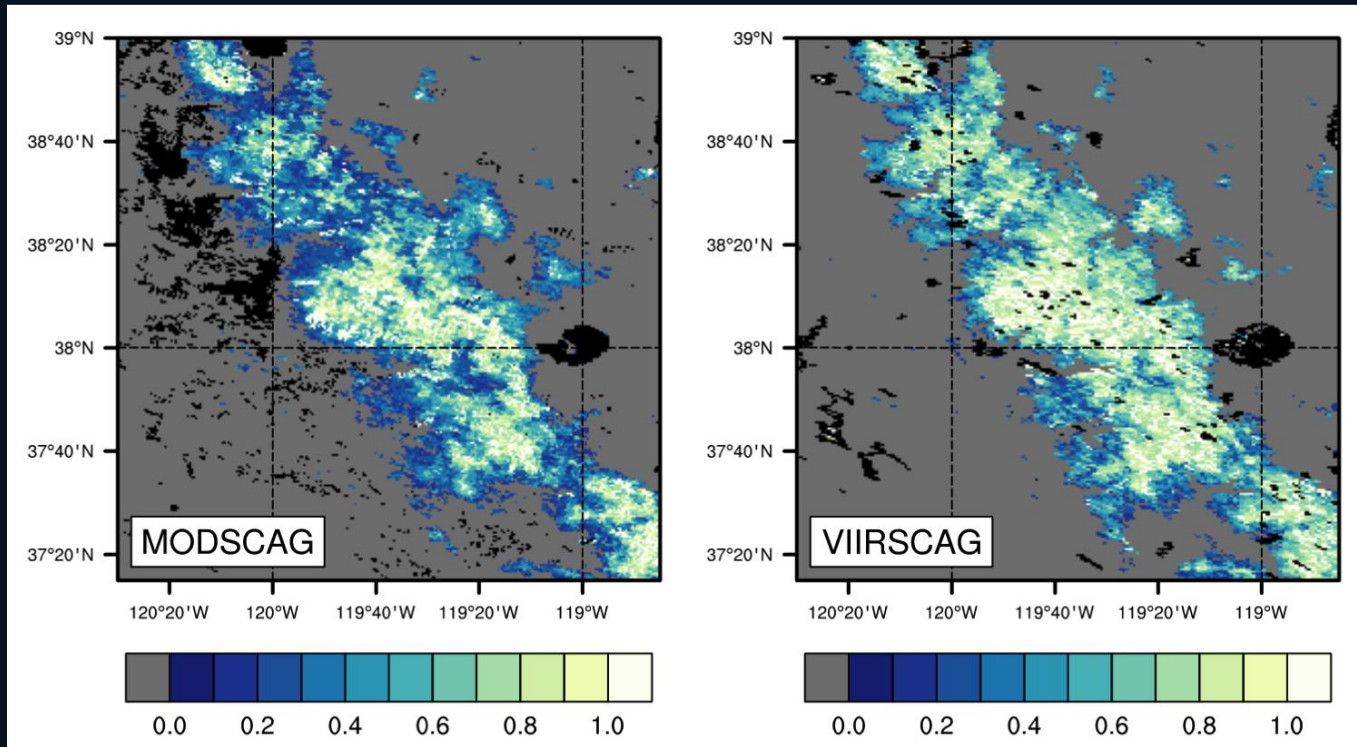

VIIRS fractional snow cover products

- VIIRS Snow Cover Products
 - Aggregated fractional cover 750m
 - Fractional product has no similarity with MODIS fractional product
- VIIRSCAG
 - Spectral unmixing 1km gridded
 - Applied to maximize similarity with existing MODSCAG fractional product
 - **Good dataset to compare with MODIS**

Evaluation of VIIRSCAG

- SnowPEX workshop 1

- Since then we have extended evaluation

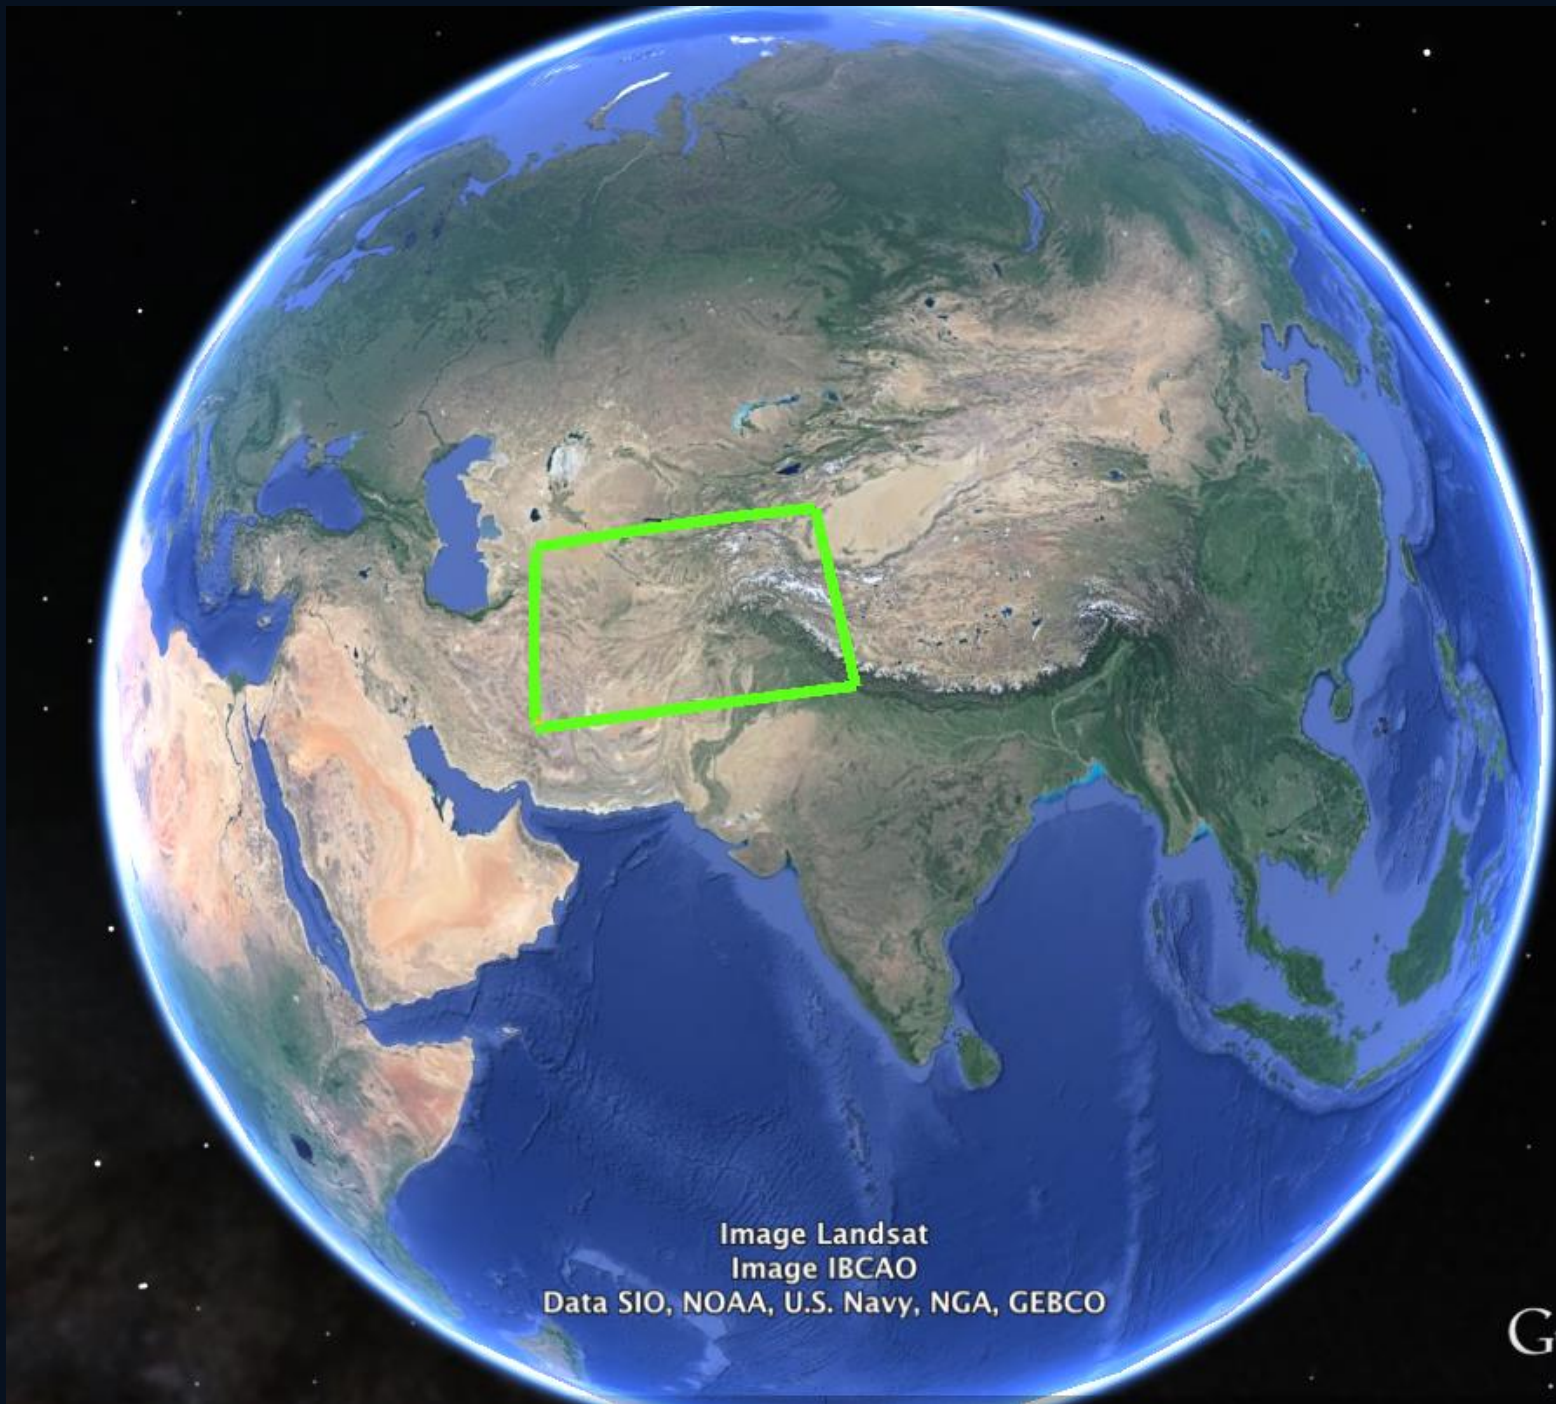

Image Landsat
Image IBCAO
Data SIO, NOAA, U.S. Navy, NGA, GEBCO

Evaluation of VIIRSCAG

- VIIRS cloud mask
- Masking 100% snow covered areas on very clear days

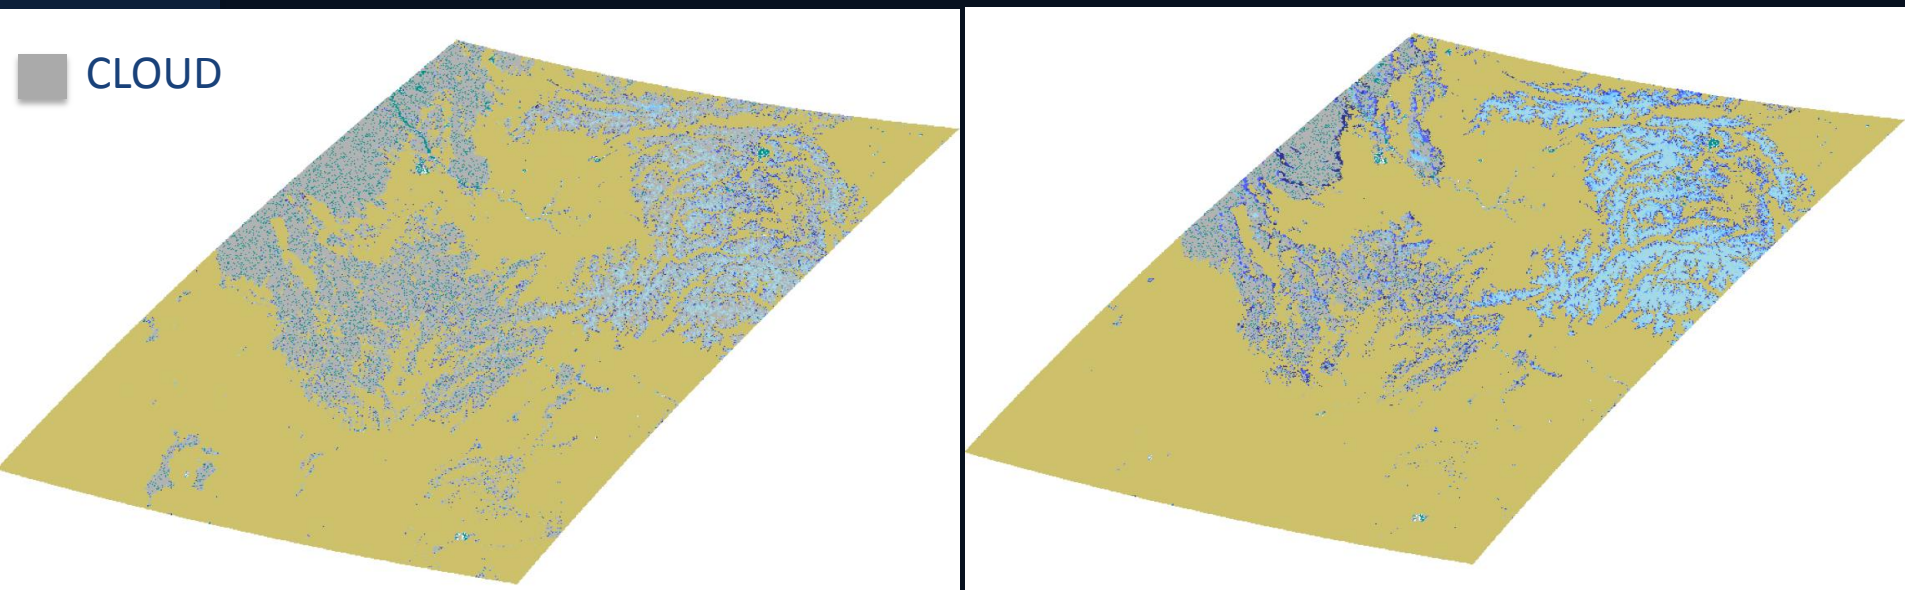

■ SNOW ■ CLOUD ■ SNOW-FREE

COMPOSITE IMAGE

Evaluation of VIIRSCAG

- To address the VIIRS cloud mask issue, we implemented a custom cloud algorithm
- Comparison of cloud masks on a very clear day (in the Karakoram)

Original VIIRS
cloud mask

New VIIRS
cloud mask

Evaluation of VIIRSCAG

- To address the VIIRS cloud mask issue, we implemented a custom cloud algorithm
- Comparison of cloud masks on a very clear day (in the Karakoram)

Mon-5.3

Fractional snow cover for Landsat OLI, MODIS, and VIIRS
from spectral mixture analysis

Karl Rittger, Kathryn Bormann, Richard,
Armstrong, Thomas, Painter, and Jeff
Dozier

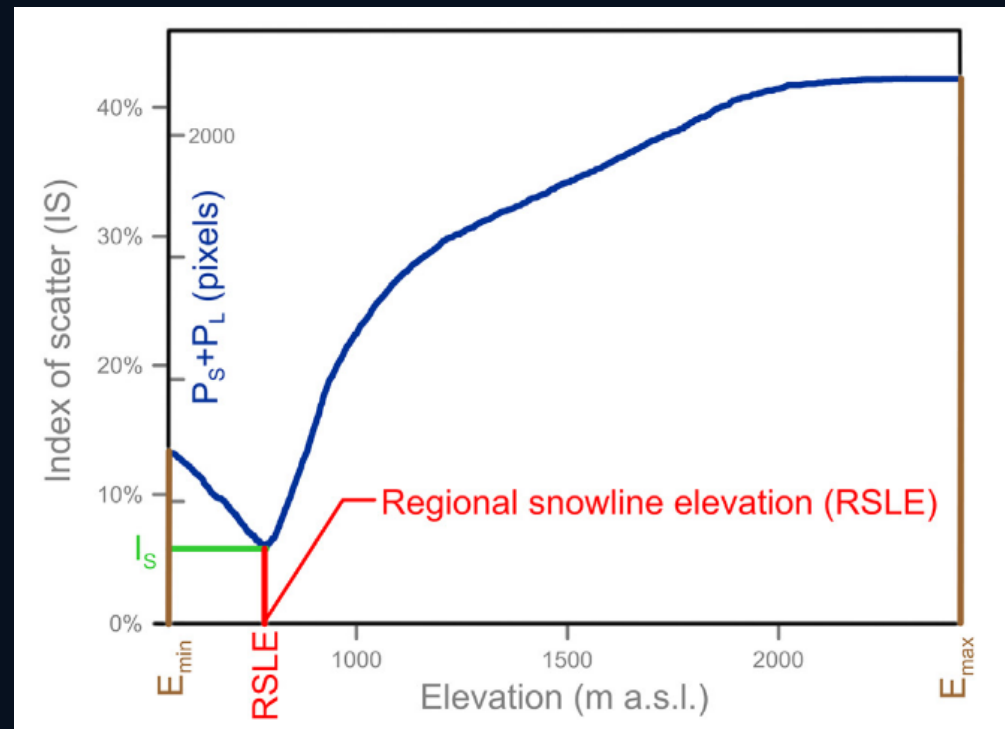

Snow metrics from satellite snow cover

- Typically reported are:
 - Snow cover area (+ fractional, + %)
 - Albedo
- With our growing 15 year long-term record (MODIS/VIIRS) we can look to metrics that will highlight regional variability and climate change impacts
 - Regional snowline elevation →

Derivation of snowline elevation

- Estimation of regional snowline elevation
 - Not straightforward
 - Recent method from Krajčů et al. (2014)
JHyd

Elevation at which land pixels *above* and snow pixels *below* is minimized

Time series

- Snow Cover Area

8.4% MAE

-13.9% Bias

- Snowline elevation

105m MAE

85m Bias

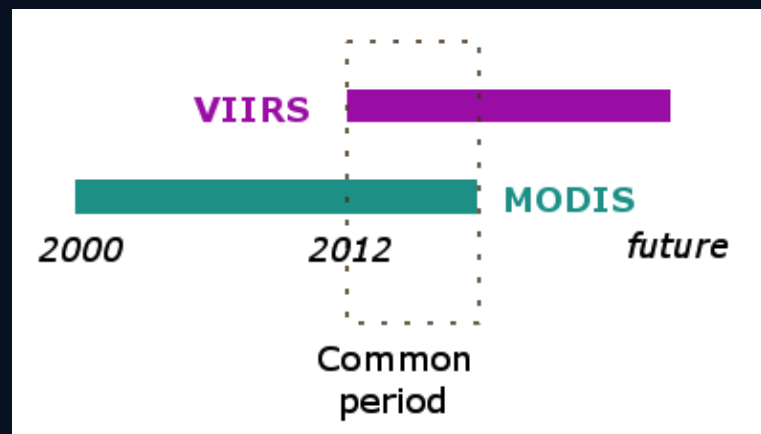

Long-term monitoring implications

- With improved cloud masking VIIRSCAG agrees exceptionally well with MODSCAG*
- The small biases we saw in VIIRSCAG are very likely just spatial resolution issues.

Where to next?

- Expand the evaluation
- Understand the differences between VIIRSCAG and MODSCAG across a range of metrics
- So when we stitch the 15+ year multi-sensor time series together we can properly assess snow cover trends
