

Proba-V CC Status & Super-Resolution Experiment Proposal

TEC-SPS

26/06/2020

Proba-V Companion Cubesat - Status & Schedule

Proba-V CC – Running and Upcoming Activities

- ✓ **CDR successfully achieved** (end Q1-2020)
- ✓ **Phase C “Bridging” Activities** (Q2-2020 -> Q3-2020)
 - Bridge between Phase A/B/C and Phase D/E1
 - Phase C complementary activities in order to:
 - Further advance GS (PDGS+FOS)
 - Further advance OBSW and AOCS SW
 - Perform STM qualification
 - Perform Structural and Thermal validation
- ✓ **Phase D/E1** (Q4-2020 -> Q2-2021)
 - Launch: End Q1/2021 (depending on launch availability)

PVCC extra details

✓ Launcher

- Flexi-ticket with SpaceFlight
- Falcon 9 and PSLV options

✓ ITU process

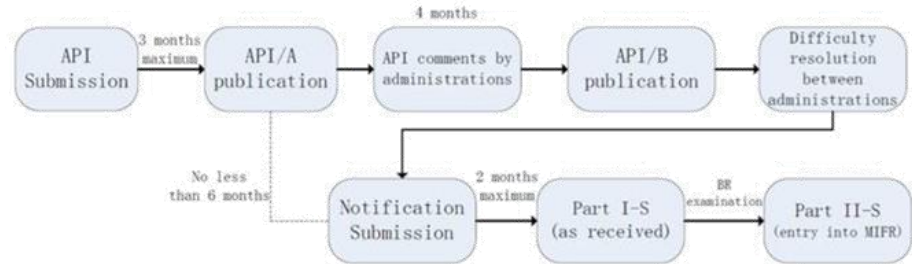

- Process started end 2019
- API/A sent out to Belgian Institute for Postal Services and Telecommunications (BIPT-national ITU) (Week 18)
- Currently waiting for BIPT answer

✓ FOS-REDU

- Demo of TMTC capabilities (Week 27)
- Redu HW in the loop at ASL test (Summer/Q3)

✓ PDGS-VITO

- ICD from ProbaV shared by VITO
- ICD from ASL on going
- Raw data needed for calibration and data ingestion validation already available

Super-Resolution Experiment (Concept)

Background/Previous Activities:

Super resolution (ground post processing) techniques have been successfully developed using proba-v data from subsequent observations (“uncorrelated” – images from successive overpasses).

Idea:

Implementation of super resolution techniques on “oversampled” acquisition lines (“correlated” – same ground surface imaged over multiple pixels, same overpass).

Super-Resolution Experiment (Acquisition)

Images Acquisition Strategy:

Yaw rotation of satellite of (e.g.) 45 deg, to oversample same areas on multiple pixels.

Implementation Steps:

Assessment of feasibility (possible latitudes range, P/F limitations, etc.),

Manoeuvres' profiles' definition and simulation,

Operational procedures' definition, validation and execution.

Possible Implementation Approach:

Implementation: Ad-Hoc Task in the frame of the proba-v ops support contract.

Super-Resolution Experiment (Processing)

Data processing approach:

Elaboration/implementation and verification, on real image data with above characteristics, of interpolation/super-resolution techniques.

Possible Implementation Approach:

- > Small Activity in the frame of VITO proba-v Support Activity?
- > New Activity in the frame of the ESA Discovery Program?
- > Others?

Implementation/Planning: TBD
