H. Kröger	Astrium	1
A. Deutz	Fokker-Space	1
A. v. Bargaen	DLR-IMF-AP	1
B. Aberle	DLR-IMF-AP	1
Total Copies		22

Change Record

Issue	Rev.	Date	Page	Description of Change
Draft		15.November 95	all	New document
1	0	30 November 95		Incorporation of comments provided by IfE, FSS-TPD-SRON, Dornier, DARA
2	0	25 July 96	all	update of measurement state parameters and addition of calibration state properties
3	0	30 January 99	all	major modifications to contents and parameter tables measurement parameter tables depicted with EEPROM-version & updated SW-version due to NCRs and DCRs engineering parameter tables included
3	1	30 May 01	See detailed change sheet	Implementation of all DCR's issued until March 2001, correction of faulty entries and editorial changes
3	2	22 July 01	See detailed change sheet	Implementation of DR-SCIA-0002DO/01 and TN117 iss.4
3	3	30 November 01	See detailed change sheet	Final implementation of TN117 iss.5 incl. state duration for ID59&61,. changed state duration for ID47&51,
3	4	09 January 02	See detailed change sheet	Final implementation of TN117 iss.5 for all Scanner basic positions of ASM UNUSED
4	0	20 March 03	all	Implementation of 'Final Flight' definitions
5	0	15 October 2003	all	OCR's and major edditorial rework

Change description for Iss.3 rev.1

Page affected	Reason for change	Description of change
v	Identification of changes	New table
10	Table adapted to SW 22.004	State summaries for ID 48;52;62 changed
13	editorial	Text supplemented with explanations
14	Tracing of implementation of DCR's	New table
17	Correction of range	Range for relative Scan Profile Factor now =-128.. +127
38 & 39	editorial	Doubled tables removed
56	Correction of EEPROM table entry	Value corrected at ID 56 & 57 in phase 2 for elevation basic scan profile identifier to '5'
60	Correction of EEPROM table entry	Value corrected at ID 61 in phase 2 for duration of phase to '00010000'
61	editorial	Change marking at ID 61 in phase 2 for duration of phase removed
70 to 73	Table appearance	Swap sequence of detector channels (see headers: '2b ; 2a')
74	editorial	Character set for unit PET now symbol > = μ sec
84	editorial	Ref. to TN-SCIA_1000FO/117 included
86	Correction of EEPROM table entry	Values for ID 61 in timing columns changed
88	editorial	DCR-list amended (DR-SCIA-0076DO/97 in ICU_SW V.2.03)
90 to 96	Correction of EEPROM table entries	Exchange of EEPROM tables (DR-SCIA-0076DO/97 in ICU_SW V.2.03
104	editorial	Character set for unit angle now symbol > = μ rad & π
104	Correction of range	Range for Scan Rate now =-0,0327628 to +0,0327627
104	editorial	DCR-list amended
106	Correction of EEPROM table entries	Column Elevation Basic Scan Position exchanged
108	editorial	Character set for unit angle now symbol > = μ rad & π
108	Correction of range	Range for Acceleration now =-327628 to +327627
116	Table appearance	Swap sequence of detector channels (see headers: '2b ; 2a')
118	editorial	DCR-list amended
124	Correction of EEPROM table entries	Cluster index 19 and 20 corrected
125	editorial	Change marking Cluster index 19 and 20 removed
128	editorial	Note: number of entries displayed is '53'
140	editorial	DCR-list amended
141	editorial	Inhibit Monitoring table: DCR-list amended
157	DR_SCIA_0010DO/98 in iss.3 rev.0 only partly implemented	Table 6.3: new limits for fault ID 105; 106, 112 implemented in RAM-table
167;171;173	DR_SCIA_0009DO/99	Table 5.4; 10.4; 14.4: fault ID 161 disabled in RAM-table
197	editorial	DCR-list supplemented by DR_SCIA_0004DO/00
207	DR_SCIA_0004DO/00	Fault ID 398 & 399: 2 parameters changed value to = '2'
217	DR_SCIA_0004DO/00	Fault ID 795: 1 parameter changed value to = '9'
223	editorial	Note added & DCR-list supplemented by DR_SCIA_0008DO/99 & by DR_SCIA_0001DO/01
225	DR_SCIA_0008DO/99 DR_SCIA_0001DO/01	SF Quad. Thresh. A to = '00165'; B to = '00045' Enc. Zero Offset A: AZ to = '-1,887788'; ELV to = '-0,335696'
228	editorial	Note added & DCR-list supplemented by DR_SCIA_0011DO/98 & by DR_SCIA_0003DO/99
231	DR_SCIA_0003DO/99	Setpoint temp. 1 to = ' -11,00'; Sensor_Gain_factor 1 to = ' -1,41'
234	editorial	Descriptive text updated
262	editorial	DCR-list supplemented by DR_SCIA_0114DO/97
265	DR_SCIA_0114DO/97	ENABLE_SYNC & TIME_CODE: new fault ID's added
272	editorial	Descriptive text updated

Page affected	Reason for change	Description of change
273 to 278	Table appearance	Swap sequence of detector channels (see headers: '2b ; 2a')
278	Value format	Sun_table: channel 2b & 2a PET now = '0,3125'
279	Correction for RAM_version	SLS-table corrected for DR_SCIA_0015DO/98
294	Value correction	Swath- end of line 1: ' ..scan speed 16°/sec.'
322	Editorial	ILOS: Descriptive text changed

1 Scope and Purpose of the Document

This Technical Note (TN) is the third volume in the trilogy of the SCIAMACHY Operation Concept TNs describing the basic knowledge about SCIAMACHY operations planning. It served prior to launch as input to the development of the ENVISAT ground segment, in particular to those systems that are required for mission planning and timelining. During in-flight operations this TN is the repository to trace the configuration of the measurement state definitions. In that respect, the TN is strongly related to the other two TNs which outline the concept of mission scenarios (SCIAMACHY Operations Concept: I. Mission Scenarios, PO-TN-DLR-SH-0001/1) and timeline generation (SCIAMACHY Operations Concept: II. Timeline Generation Rules and Reference Timelines, PO-TN-DLR-SH-0001/2). Although each individual TN can be treated as a separate document, the full picture of the operations concept can only be obtained by dealing with all three TNs.

The 5th issue of the TN is prepared based on the parameter settings as defined for the implementation of the *'FINAL-FLIGHT'*-states and subsequent corrections. These parameter settings reflect a set of state parameters based on the evaluation of measurements executed during the SODAP and CAL/VAL-phase of SCIAMACHY in 2002 and the issue of some OCR's between December 2002 and October 2003. The presently defined states and sets of parameters reflect the knowledge base of the instrument performance and operation at time of issue of this document in compliance with the scientific requirements. This onboard version of the parameter settings differs greatly from the EEPROM-version in nearly every respect resulting in a very large number of changes.

Also the present Issue 5 Rev. 0 of this TN representing the *'FINAL-FLIGHT'*-states will further undergo the iterative process of optimising instrument measurement states and state parameters, which will continue throughout the life of SCIAMACHY. The involved parties will continue to use the established procedures for implementation and configuration control for updates of parameters, whenever these are required from a scientific or technical point of view. This issue is not addressed here but is covered in several dedicated interface documents issued by ESA and SCIAMACHY project management.

Issue 5 of this TN, which provides the state definitions for final flight states and instrument engineering parameter settings, differs from issue 4 mainly in the following areas

- update/redefinition of measurement and calibration/monitoring states to reflect the instrument status at time of issue of this TN
- inclusion of all OCR's issued
- high number of corrections of editorial nature

Note: in this issue the comparison between the final EEPROM-version ICU_SW V.2.03 and the present status of the inflight RAM is presented. In the preface of each parameter table in chapters 5 to 7 reference is given only to changes initiated via OCR after the definition of the first *'Final-Flight'*-configuration. Chapter 8 shows references to all documents, which initiated updates to engineering parameter tables.

3 Timeline Execution and Instrument States

Instrument states are the smallest building block in the frame of operations timelining. The basic rules how to use these building blocks when generating sequences of instrument activities are listed in the TN about timeline generation rules (SCIAMACHY Operations Concept: II. Timeline Generation Rules and Reference Timelines, PO-TN-DLR-SH-0001/2). In summary, the state definitions have to obey the following boundary conditions

- maximum number of states is 70
- states are defined by sets of parameters
- states are controlled by Relative Time Command Sequences (RTCSs)
- states can be modified by macrocommands (MCMDs)

This TN will provide the information on the currently defined states, i.e. the assignment of state identifiers to specific measurement categories and specific parameters. The corresponding parameter tables are maintained under configuration control by SOST. Any modifications present and in future to the parameters or even state definitions follow defined procedures. Fig. 1 and 2 depict the logic flow between various types of tables when executing a timeline. Shaded boxes in fig. 1 indicate the corresponding tables presented in this TN. For the hatched boxes, the general layout of the tables is given. In fig. 2 the relation between the tables is shown for a specific case in more detail. Each table serves a specific function (see also chapter 5). The table functions are as follows.

A timeline is started by a *START_TIMELINE* MCMD. This MCMD enters the RTCS Table where, after the corresponding RTCS for the start of the timeline has run to completion, the identifier of the instrument_timeline is transferred to the

⇒ **TIMELINE INDEX Table:**

The identifier of the instrument_timeline is correlated with the start index for the instrument_timeline in the TIMELINE table. The TIMELINE INDEX table has 63 entries (identifiers from 1 to 63) corresponding to the maximum number of instrument_timelines to be stored onboard.

⇒ **TIMELINE Table:**

The start index of the instrument_timeline defines the location of the instrument_timeline in the TIMELINE table. The TIMELINE table has 4096 entries, i.e. the sum of all entries for all 63 instrument_timelines must not exceed this number. Each instrument_timeline ends with an END OF TIMELINE entry. Note that the END OF TIMELINE entry counts like a separate state entry in an instrument_timeline. The identifiers of the states in the sequence of an instrument_timeline are listed sequentially in the TIMELINE table with the first state being found at the start index.

⇒ **STATE RTCS INDEX Table:**

For each state identifier from the TIMELINE table, the STATE RTCS INDEX table provides the start index of the RTCS associated with that state. The RTCS INDEX table has 70 entries, corresponding to the maximum number of states. The RTCS start index is transferred to the RTCS table and the state is executed.

⇒ **RTCS Table:**

Each RTCS is listed in the RTCS table with its sequence of primitive commands. A total of 1000 primitive commands can be stored. The RTCS start index defines the location where the first primitive command to execute the RTCS (i.e. the state) can be found.

Note: There are two types of RTCS: NORMAL RTCS (e.g. *STR_TML*) and STATE RTCS (STT_01-STT_15). All NORMAL RTCS are designed such that only one Primitive Command is executed at any given point in time. STATE RTCS are designed such that only one Primitive Command is executed in each of the three processors ICU, PMTC and SDPU at any given point in time. Hence

not more than three Primitive Commands can be executed simultaneously. This concept allows to shorten the execution time of STATE RTCS when preparing a measurement or when cleaning up after measurement. The execution of a state is controlled only by one particular STATE RTCS (see table 2) and by parameters, defined in various STATE Parameter and COMMON Parameter tables.

⇒ STATE Parameter and COMMON Parameter Tables:

These tables contain the information relevant for the execution of the state. The parameters can be grouped into different classes according to their functional purpose (see also fig. 4 in chapter 5). Note that only a fraction of the COMMON Parameters will be described in the TN in detail, i.e. those that have a direct impact on STATE Parameter tables.

After the execution of the state (end of the corresponding RTCS), the ID of the next state in the instrument_timeline is read from the TIMELINE table and the sequence TIMELINE table - RTCS INDEX table - RTCS table (with state execution) occurs again. This loop is executed until the END OF TIMELINE entry at the end of the instrument_timeline is reached. Control is then returned to outside the instrument_timeline execution chain and a new instrument_timeline, if required within an orbit_timeline, can be started.

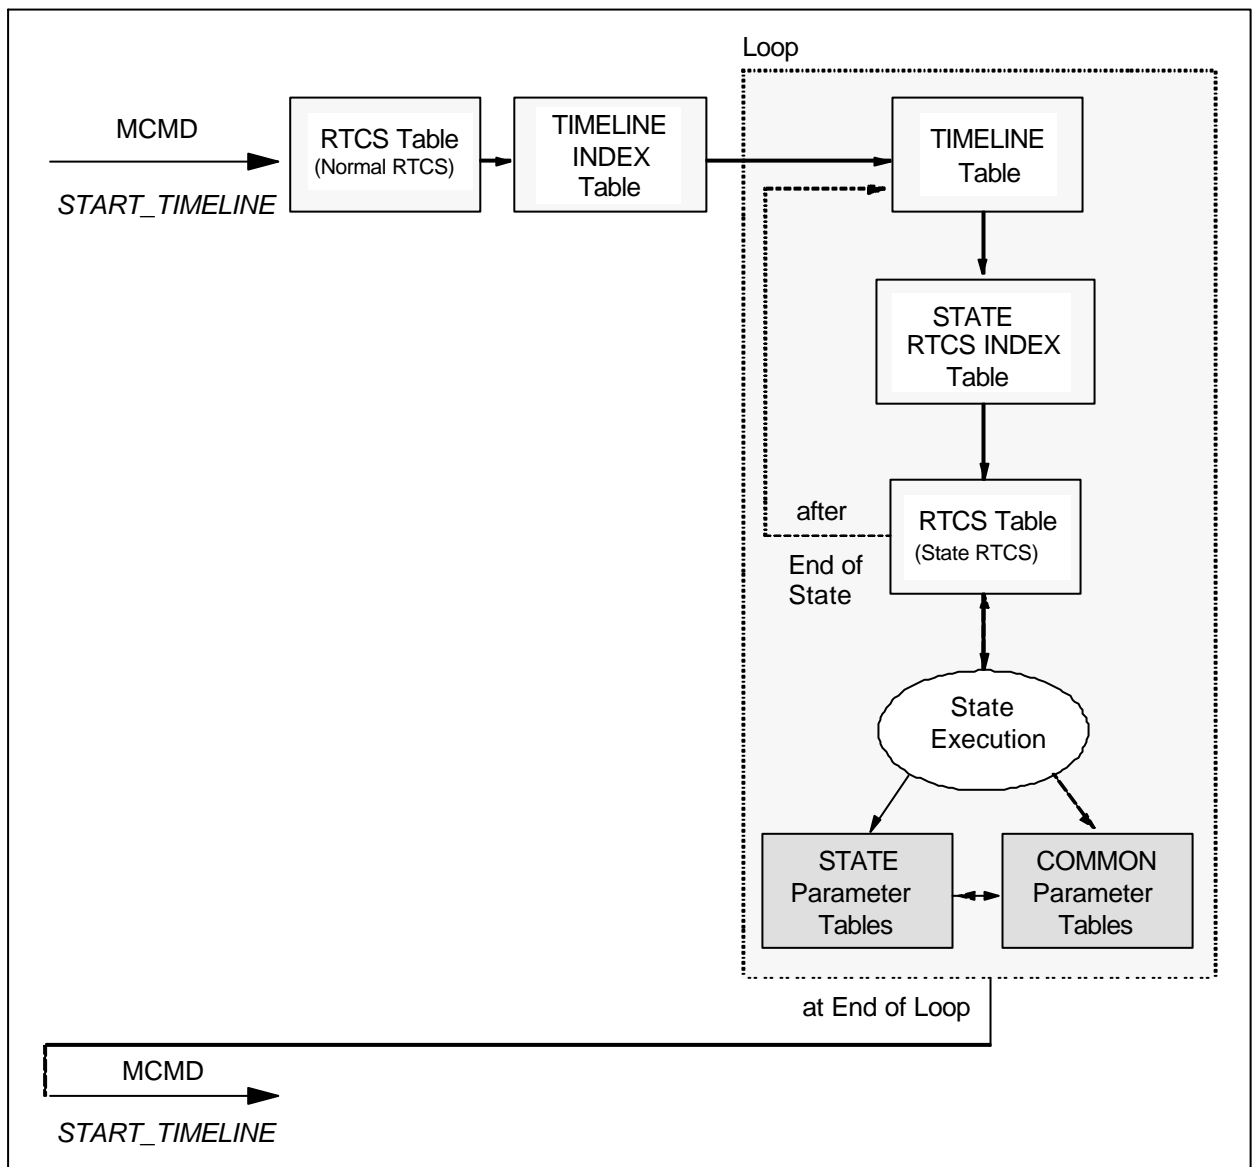

Figure 1:

Timeline Execution - General Flow

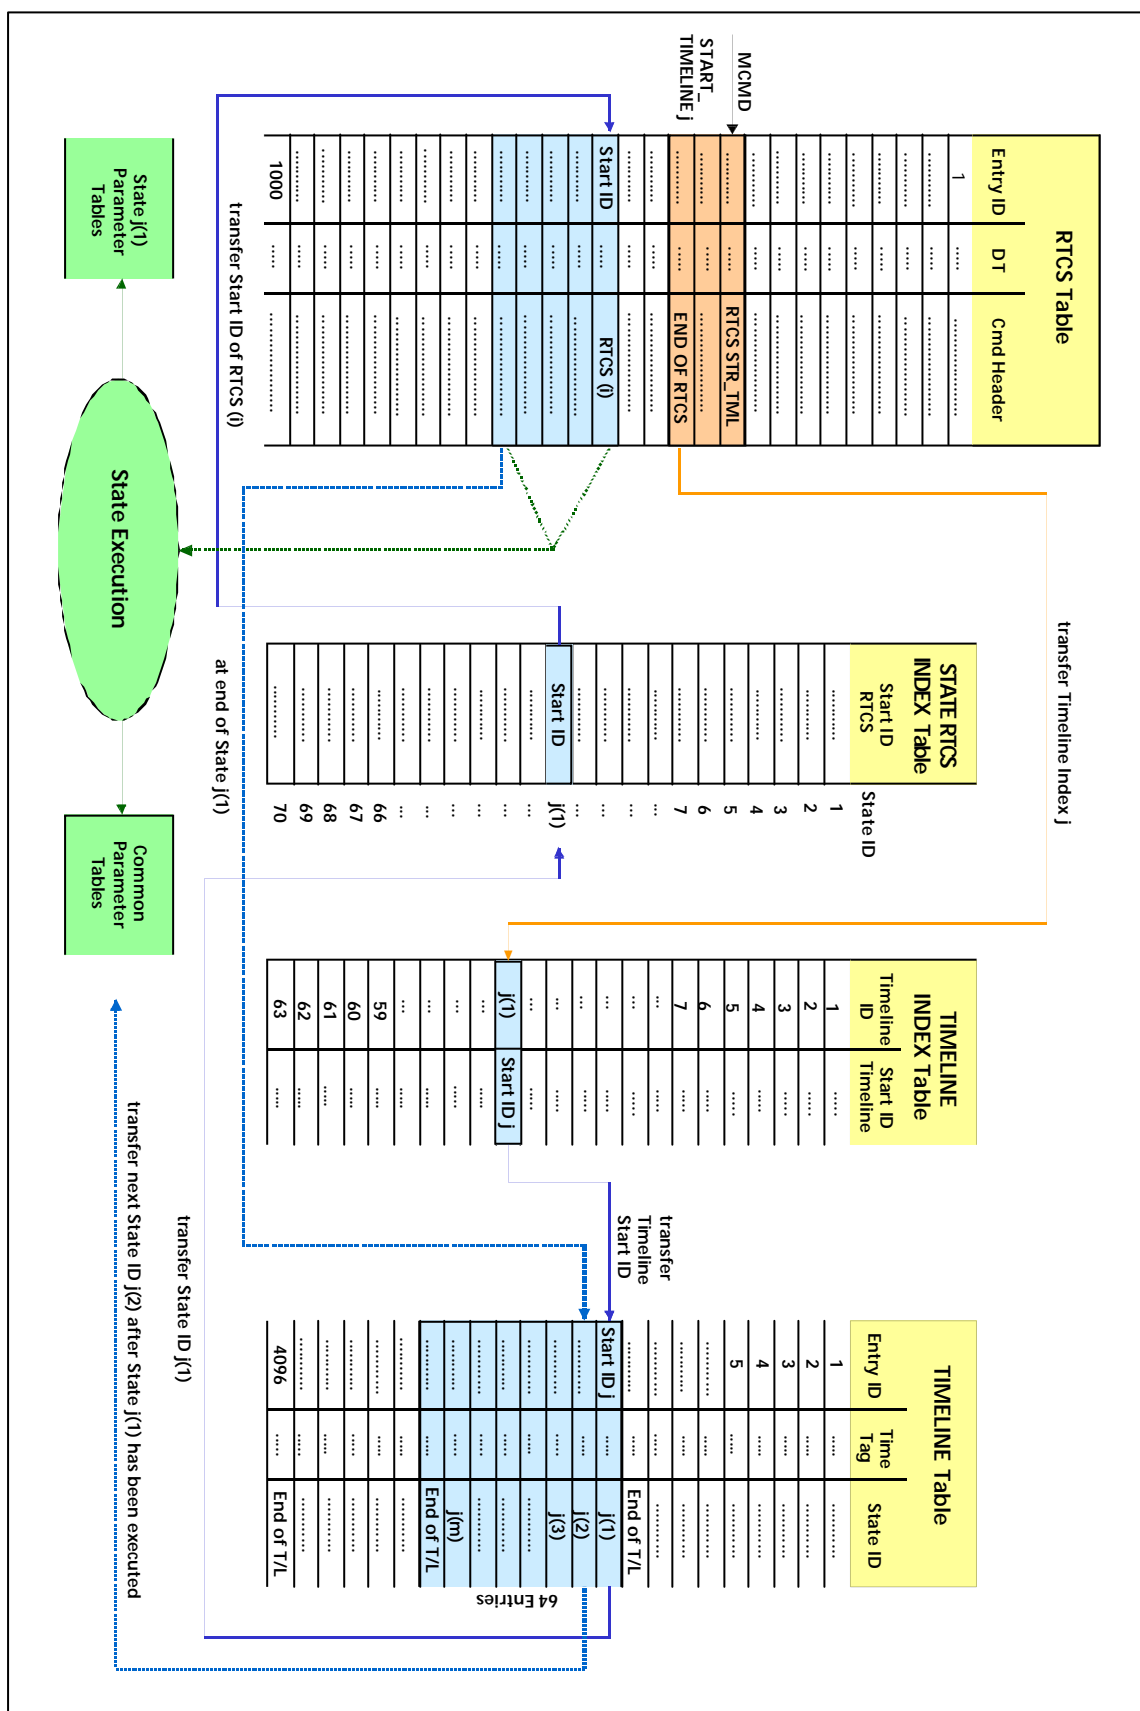

Figure 2: Timeline Execution - Detailed Flow

4 State Summary and Orbit Dependence

The current definition of the 70 states, i.e. the assignment of specific measurement categories with specific parameter sets to a state identifier i ($1 \leq i \leq 70$) is outlined in table 1. The table presented reflects the status of the Final Flight configuration as loaded into RAM October 15th 2003.

Table 1 is a top level table which does not play a role in the actual timeline execution as depicted in fig. 3. Tables that will provide insight into the parameter space are depicted in chapter 5. The columns in table 1 have the following meaning:

State ID	State identifier
State Acronym	Acronym used in the definition of reference timelines
Function	Purpose of state
Cat. (Type)	Title of state
Cat. (ID)	Measurement category
Orbital Position	Position in orbit (in degrees) where state should be executed. The definition is in a sun fixed reference frame. Origin (0 degrees) is the orbital position close to the SO&C window perpendicular to the centroid of the sub-solar window.
RTCS	RTCS controlling state execution
Description	Short description of major state properties
Timing	State timing properties related to measurement (no. setup and cleanup)
ESM	Status of Elevation Scan Mechanism
ASM	Status of Azimuth Scan Mechanism
NCWM	Nadir Calibration Window Mechanism
APSM	Aperture Stop mechanism
NDFM	Neutral Density Filter Mechanism
WLS	White Light Source
SLS	Spectral Lamp Source
Scan Speed	Scan speed (ILOS) for measurement states (1 st line: ESM, 2 nd line: ASM)
Cluster Definition Index	assigned Cluster Definition

NOTE:

because of pending OCRs some states described here in table 1 may become subject to further modifications.

Table 2 summarises the properties of the RTCS used in the definition of the states.

It is obvious in table 1 that most of the states are reserved for scientific measurement categories (limb, nadir, SO&C, MO&C). This fact is partially due to the requirement to implement a flexible exposure time scheme. With the sunlight incidence angle (w.r.t. the atmosphere) being a function of latitude, the intensity of the reflected and scattered light measured in orbit varies with orbital position. Therefore, in order to achieve signal-to-noise ratios in the observed radiances which allow accurate retrieval of atmospheric trace gases and to avoid saturation, exposure times and co-adding factors for limb and nadir categories must also be latitude dependant, i.e. they vary across the orbit.

Fig. 3 displays this relation. The shaded inner disk represents the Earth with arrows pointing at three sun fixed positions. The sun is located to the right. A sun fixed reference system can be defined with its origin close to the North Pole (the 90°-axis points towards the sun in the ecliptic plane). Three rings above the Earth disk indicate the orbital positions of nadir, sun/moon fixed and limb states (each number in a cell within the ring refers to the state IDs of table 1). Note that over the North polar region limb states start

significantly prior to the SO&C window because they sense atmospheric volumes which lie sufficiently ahead of the instrument, i.e. they are already illuminated by the rising sun. Measurements in nadir mode have to wait until the spacecraft has reached a position in orbit where the atmosphere below the instrument is hit by the first sunlight. In the South polar region this relation reverses. The orbital location of the MO&C window is only sketched. Analysis of Sun and Moon visibility in SCIAMACHY's FOV indicates that the rising Moon can be seen over a wide latitude range in the southern hemisphere depending on the time of observation and whether it is measured at the beginning or end of a monthly period.

The non-illuminated part of the orbit (eclipse period) will mainly be used for calibration and nadir-eclipse measurements and also for any scheduled maintenance purposes.

notes referring to SFS:

SFS modes

The sun follower system is used for acquisition/tracking of sun and moon.

inactive:

SFS is not part of the control loop

operating:

SFS is in operation e.g. to correct the centre of a scan but not part of the complete scanner control loop

centre pointing:

SFS is part of the scanner control loop following the centroid of sun/moon on their trajectory

note referring to scan speed

In column *Scan speed* the listed angular velocity is referring to the line of sight

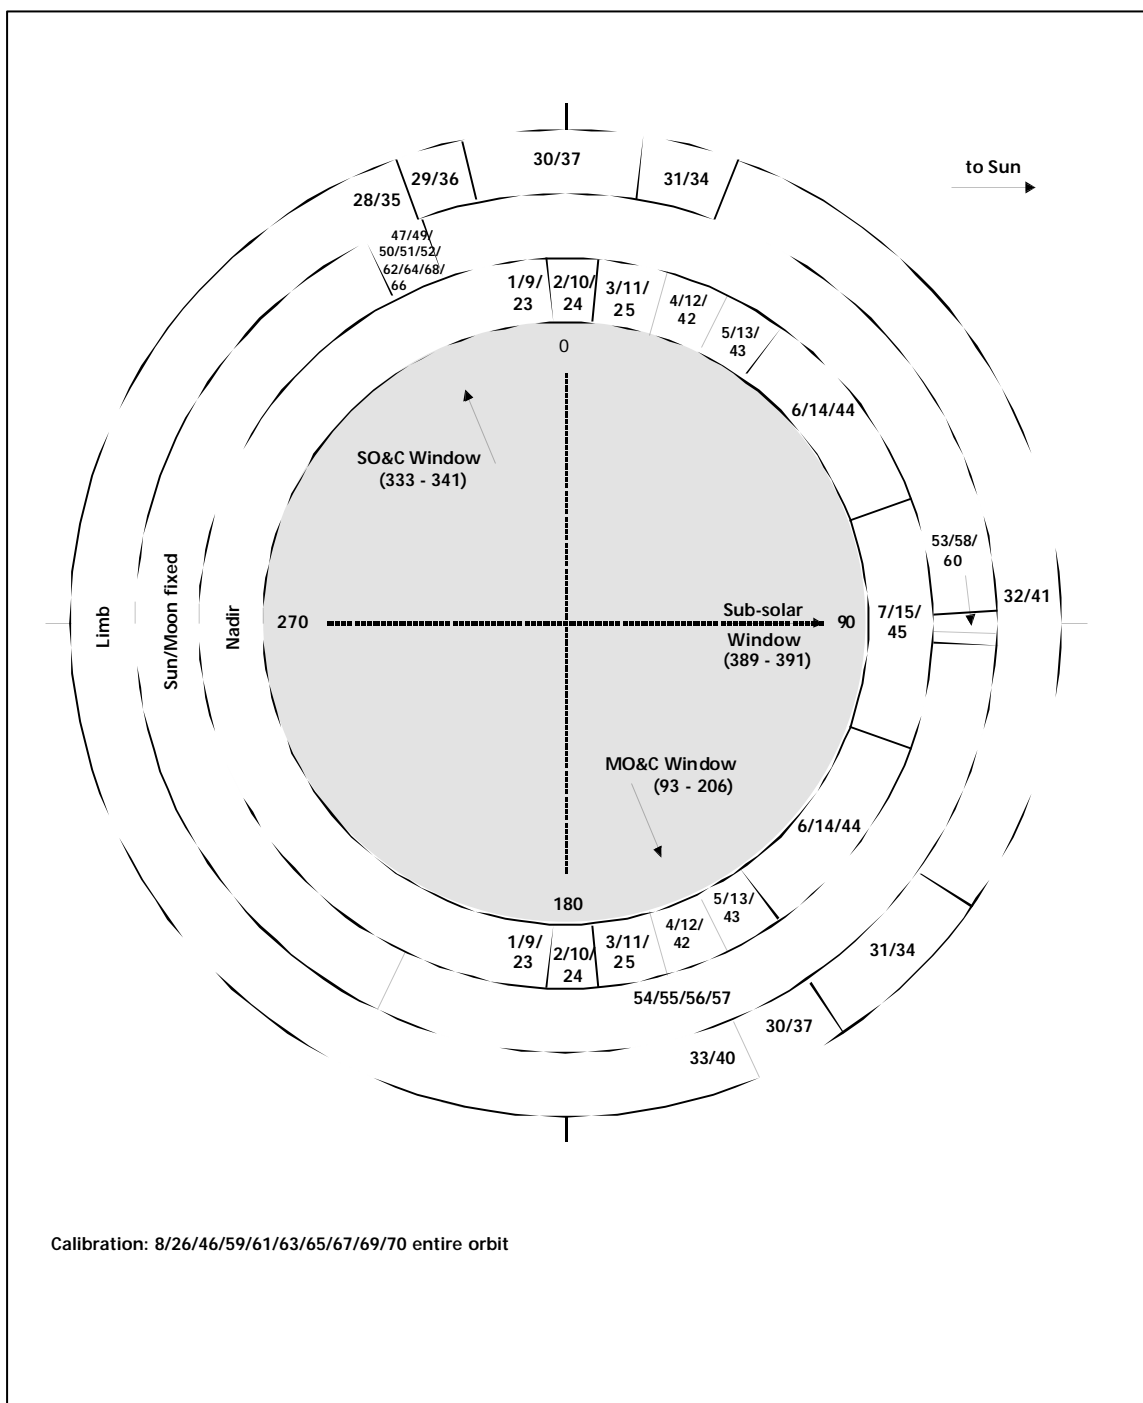

Figure 3: Orbital Position of Limb, Nadir and Sun Fixed States

5 State Parameter Description

This chapter describes each instrument state down to the level of individual STATE and COMMON parameters. These parameters can be grouped in different classes as depicted in fig. 4. Shaded boxes indicate those parameters whose tables are presented here in the 3rd volume of the SCIAMACHY Operations Concept TN's. From the COMMON parameter tables only those, which are "referenced" by STATE parameter tables (e.g. the Scanner State Parameter Table refers to entries in the Scan Profiles Table) are described in this chapter.

The layout of the succeeding sub-chapters is table dependant. Nevertheless it has been tried to maintain a common structure with a table template preceding each parameter table. The template has the purpose to

- identify the MCMD which is required to update the parameters stored in the ICU
- provide a reference to the list of MCMDs according to the latest issue of the Instrument Operations Manual (RD 1)
- specify the range and unit of each parameter together with an indication of the parameter function
- present information about
 1. the table parameter values as defined at time of *Issue 5 Rev.0* of this TN reflecting the status of definition of the 'Final-Flight'-states including the implementation of all accepted DCR's pre-launch, the complete of chages introduced by the definition of the final flight parameter set and all subsequent approved and implemented OCR's
 2. the table parameter values as defined at time of the last burning of the onboard ICU-EEPROM (necessary corrections to contents in tables for the EEPROM parameters are included)

The second bullet is included since a more detailed description of the properties of each parameter can be found in the MCMD sheets of RD1 Annex 6.

The last bullet covering the table parameter values serves the purpose to identify necessary updates of parameter tables via MCMD (either as part of Error Correction during NT3 Part 4 -see RD 1 or via CTI-I/F for instrument tuning and optimisation) in order to write into the working area of the ICU-RAM the latest valid version of parameter tables.

Note that the tables presented here in the TN cannot serve the purpose to explain the instrument actions and activities triggered by the parameters.

OCR Status

The table below lists the status of issued OCRs. Pending OCRs either wait for approval of the implementation option by the originator, approval by project management or implementation by SOST. In case implementation is finished, the associated column lists the date and the orbit number when the modification becomes effective.

OCR	Originator	Issue Date	Subject	Approval	Implementation
1	S. Noël, IFE	11/02/03	Reduce Moon Occ PETs to 1 s	27/02/03	10/03/03, orbit 5358
2	S. Noël, IFE	20/02/03	Change nadir scan w.r.t. TCFoV anomaly (PR-ID 36)	17/03/03	08/04/03, orbit 5771
3*	Q.L. Kleipool, SRON	27/02/03	In-flight measurement of channel 8 non-linearity	18/03/03	30/04/03, orbit 6090
4*	Q.L. Kleipool, SRON	27/02/03	In-flight measurement of channel 7 non-linearity	pending	pending
5*	Q.L. Kleipool, SRON	26/02/03	Harmonisation of the monthly dark signal calibrations	12/03/03	04/04/03, orbit 5711/5712
6*	Q.L. Kleipool, SRON	26/02/03	Increase of dark current blocks in the eclipse timeline	12/03/03	04/04/03, orbit 5711/5712
7	SRON	07/07/03	Revision of calibration states 67, 8, 16 and 48	10/07/03	21/07/03, orbit 7267
8	G. Lichtenberg, SRON	09/05/03	Change of final limb tangent height step ('Limb dark') from 150km to 250km	13/05/03 & 07/07/03	26/05/03, orbit 6456 & 21/07/03, orbit 7265 (limb_mesosphere)
9*	G. Lichtenberg, SRON	07/05/03	Repetition of memory effect from SODAP	23/06/03	16/07/03, orbit 7193/7194
10*	J. Skupin, IFE	08/05/03	Perform WLS over diffuser measurements (state 70, meas.cat. 19) in eclipse only	20/05/03	13/07/03, orbit 7151
11	M. Gottwald, DLR	21/07/03	Improvement of limb/nadir matching	22/09/03	15/10/03, orbit 8489

: OCR's marked with '' are not related to parameter tables or are for temporary test puposes only

Table 3: OCR - Implementation status

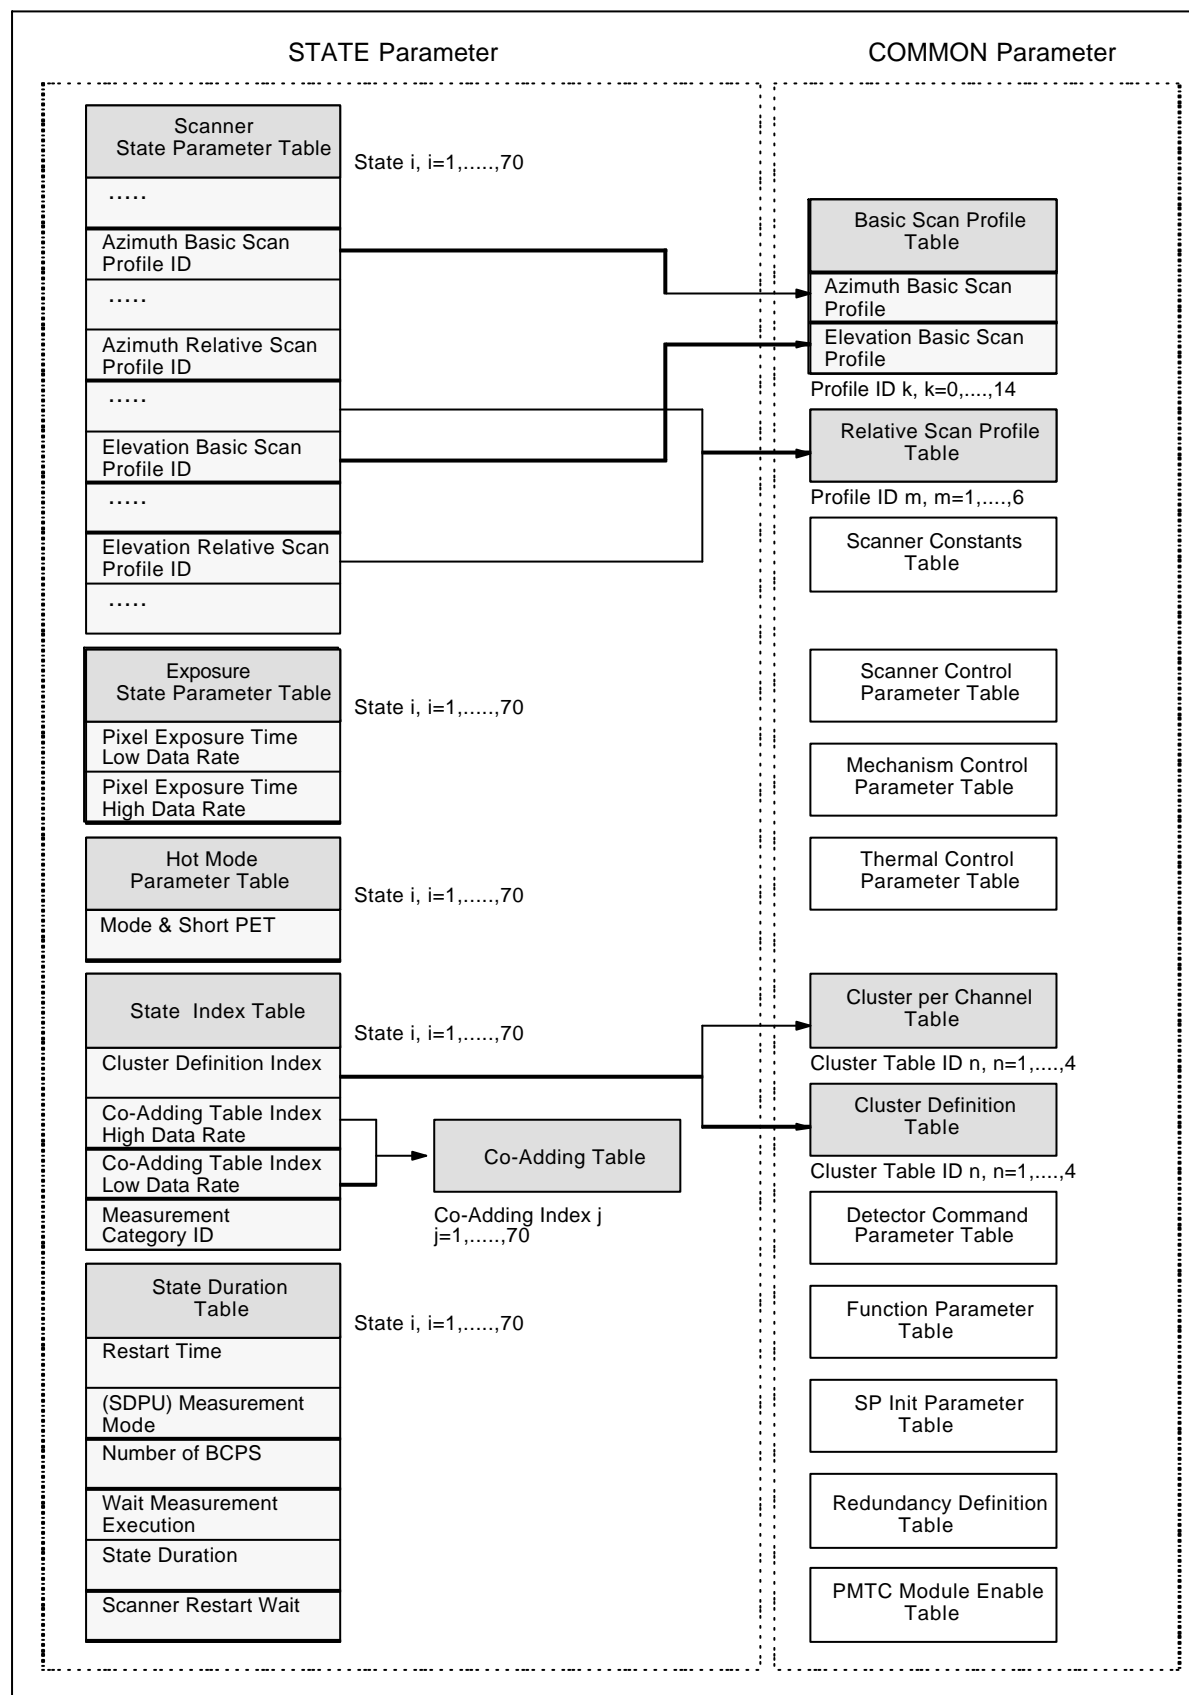

Figure 4: STATE/COMMON Parameter Classes

5.1 STATE Parameter Tables

5.1.1 Scanner State Parameter Table

This table defines various scanner parameters. A Scanner State Parameter table exists for each state, i.e. the total number of tables in this class is 70.

Table Template:

MCMD: SET SCANNER STATE PARAMETER (IOM Reference A6.49)

Columns:

Common parameter: parameters, applicable to all phases (columns 3 - 10)
note that the term "common" is only used locally; it does not refer to the COMMON parameters (chapter 5.2)

Phase 1 - Phase 8: particular phases of the scan activities (phase 1 = transition from scanner idle to scanner start position, last phase = transition from scan to idle);
the maximum number of phases is given by the row parameter *Number of Scan Phases*

Trailer: only for internal use

Rows:

State ID: identifier of measurement state; range = 1-70

spare: presently unused

Relative Scan Profile Factor n: multiplication factor to be applied to the Relative Scan Profile parameters *Angular Variation*, *Start Acceleration*, *End Acceleration*;
(n=1-6) if no Relative Scan profile shall be used in a state, all factors shall be "0"; range = -128 ... +127

spare: presently unused

Number of Scan Phases: number of phases for each scanner mode; range = 1-8 (according to used phases of columns 3-10)

Duration of Phase: duration of the scan phase in milliseconds; this parameter has precedence for the timing of a phase; range = 250msec-6500 sec
note that the duration of phase 1 and the last phase are smaller than the setup and cleanup times because the latter include the execution times of the corresponding primitive commands

Phase Type: selection of type of scanner movement; range = 0/1
0 = transition to position defined by nominal profile - see IOM
1 = scan execution according to phase parameters

Azimuth Centering of Relative Scan Profile: selection of centering; range = 0/1
0 = no centering applied
1 = apply centering algorithm to Relative Profile

Azimuth Filtering: selection of filtering; range = 0/1
0 = no filtering applied
1 = apply filter for smoothing the transition from encoder to sun-follower feedback

Azimuth Inverse Rel. Scan Profile for Even Scan: selection of inversion scheme, range = 0/1
0 = no inversion, all repetitions are identical
1 = inversion, each 2nd scan profile in a series is inverted

Azimuth Correction of nominal Scan Profile: selection of correction type for Basic Scan Profile for time dependent effects to achieve nominal

	ILOS scan trajectory; range = 0-9 0 = no correction 1-9 = different types of corrections - see IOM A6.46
Azimuth Relative Scan Profile Identifier:	selection of Relative Scan Profile stored in the PMTC; the Relative Scan Profile is added to the Basic Scan Profile; range = 0-6 0 = no Relative Scan Profile j (j=1,.....,6) = Relative Scan Profile j
H/W Constellation:	selection of ILOS conversion algorithms for the optical H/W constellation in use; range = 1-5 (according to 5 different algorithms - see [R 6], p. 79)
Azimuth Basic Scan Profile Identifier:	selection of Basic Scan Profile stored in the PMTC; range = 0-14 (according to number of Basic Scan sets)
Azimuth Number of Repetition of Relative Scan:	number of repetitions of Relative Scan Profile in one scan phase, range = 0-4095 0 = no repetition, executes selected Relative Scan Profile only once n>0 = execution of n repetitions
spare:	presently unused
Elevation Centering of Relative Scan Profile:	selection of centering, range = 0/1 0 = no centering applied 1 = apply centering algorithm to Relative Profile
Elevation Filtering:	selection of filtering, range = 0/1 0 = no filtering applied 1 = apply filter for smoothing the transition from encoder to sun-follower feedback
Elevation Inverse Rel. Scan Profile for Even Scan:	selection of inversion scheme, range = 0/1 0 = no inversion, all repetitions are identical 1 = inversion, each 2 nd scan profile in a series is inverted
Elevation Correction of nominal Scan Profile:	selection of correction type for Basic Scan Profile for time dependent effects to achieve nominal ILOS scan trajectory; range = 0-9 0 = no correction 1-9 = different types of corrections - see IOM
Elevation Relative Scan Profile Identifier:	selection of Relative Scan Profile stored in the PMTC; the Relative Scan Profile is added to the Basic Scan Profile; range = 0-6 0 = no Relative Scan Profile j (j=1,.....,6) = Relative Scan profile j
spare:	presently unused
Elevation Basic Scan Profile Identifier:	selection of Basic Scan Profile stored in the PMTC; range = 0-14 (according to number of Basic Scan sets)
Elevation Number of Repetition of Relative Scan:	number of repetitions of Relative Scan Profile in one scan phase; range = 0-4095 0 = no repetition, executes selected Relative Scan Profile only once n>0 = execution of n repetitions

At time of issue the following OCR's are affecting the table content of the FINAL-FLIGHT definitions such, that the consequent modifications are subject to RAM-updates via MCMD.

OCR	Issue date	issued by	Title	State affected
OCR_008	09/05/03	SRON; G.Lichtenberg	Change of final limb tangent height step ('Limb dark') from 150km to 250km	27; 54 - 57
OCR_011	21/07/03	SOST-DLR; M.Gottwald	Improvement of limb/nadir matching	28 - 37; 40; 41

5.1.2 Pixel Exposure Time Parameter Table

This table defines the pixel exposure times for all states, both for the low and the high data rate. Only one table of this class exists.

Table Template:

MCMD: SET EXPOSURE STATE PARAMETER (IOM Reference A6.35)

Columns:

State ID: identifier of state; range = 1-70
Data Rate: data rate for which the exposure times apply; the Pixel Exposure Time (PET) is specified separately for high and low data rate
Channel 1a - Channel 8: PET in SCIAMACHY measurement channels (including the separation of the first two channels into virtual channels) in BCPS (1 BCPS=62.5 msec); range = 1-16383 (62.5 msec - 1023.9375 sec); note that the value "0" corresponds to 31.25 msec i.e. only pixel data from every second exposure will be read

Note that the values for the PET are further on under investigation. They depend on instrument performance subject to the SCIAMACHY monitoring task. In addition the optimisation of the PET is ongoing in order to obtain the best results (signal-to-noise ratio) over the complete orbit

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

OCR	Issue date	issued by	Title	State affected
OCR_001	11.Feb.03	IFE, S.Noel	Reduce Moon Occ PETs to 1 s	54 - 57
OCR_007	07.Jul.03	SRON	Revision of calibration states 67, 8, 16 and 48	8; 67

Hot Mode Parameter Table

This table defines whether to invoke the Hot Mode for channels 6-8 or to use the PET-values as defined in the Pixel Exposure Time parameter table. Only one table of this class exists.

Table Template:

MCMD: SET HOT MODE (IOM Reference A6.37)

Columns:

State ID:	identifier of state; range = 1-70
Channel 6 - Mode:	definition of the exposure time in channel 6; range = 00/01 00 = normal mode, i.e. the exposure time is defined by the PET 01 = Hot Mode, i.e. the exposure time is <u>not</u> defined by the PET
Channel 6 - Short PET:	scaling factor for determination of exposure time in channel 6 when mode is set to "01" (exposure time=28.125 μ sec*2Short PET); range = 0-10
Channel 7 - Mode:	definition of the exposure time in channel 7; range = 00/01 00 = normal mode, i.e. the exposure time is defined by the PET 01 = Hot Mode, i.e. the exposure time is <u>not</u> defined by the PET
Channel 7 - Short PET:	scaling factor for determination of exposure time in channel 7 when mode is set to "01" (exposure time=28.125 μ sec*2Short PET); range = 0-10
Channel 8 - Mode:	definition of the exposure time in channel 8; range = 00/01 00 = normal mode, i.e. the exposure time is defined by the PET 01 = Hot Mode, i.e. the exposure time is <u>not</u> defined by the PET
Channel 8 - Short PET:	scaling factor for determination of exposure time in channel 8 when mode is set to "01" (exposure time=28.125 μ sec *2Short PET); range = 0-10

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

OCR	Issue date	issued by	Title	State affected
OCR_007	07.Jul.03	SRON	Revision of calibration states 67, 8, 16 and 48	16;48 (channel 6)

5.1.3 State Index Table

This table defines the relation between states, cluster definition and co-adding index, both for the low and the high data rate. Only one table of this class exists.

Table Template:

MCMD: SET STATE INDEX TABLE (IOM Reference A6.54)

Columns:

State ID:	identifier of state, range = 1-70
Cluster Table Index:	selection of the clustering scheme (cluster: pixel area of a sensor/channel with identical PET and co-adding factor); range = 1-4; the Cluster Definition Table is given in chapter 5.2.4
Coadding Index High Data Rate:	selection of the co-adding table for the high data rate; range = 1-70 (note that the equality of the maximum number of co-adding schemes and the maximum number of states is only accidental) the Co-Adding Tables are given in chapter 5.1.6 Note: for the ADC calibration, the co-adding index is set to "0"
Coadding Index Low Data Rate:	selection of the co-adding table for the low data rate; range = 1-70 (note that the equality of the maximum number of co-adding schemes and the maximum number of states is only accidental) the Co-Adding Tables are given in chapter 5.1.6 Note: for the ADC calibration, the co-adding index is set to "0"
Measurement Category ID:	identification of the measurement category, range = 1-22 (note that this parameter is not used onboard, it is added to the measurement data packets for ground processing purposes) the assignment of IDs is as follows: 1 = Nadir 2 = Limb 3 = Nadir_Pointing 4 = SO&C_Scanning 5 = SO&C_Pointing 6 = MO&C_Pointing 7 = Moon scanning 8 = Sun_Diffuser_Calibration (ND filter out) 9 = Sub-solar Calibration 10 = Spectral_Lamp_Calibration 11 = White_Lamp_Calibration 12 = Dark_Current_Calibration 13 = Sun Nadir/Elevation_Mirror_Calibration 14 = Moon Nadir/Elevation_Mirror_Calibration 15 = ADC Calibration 16 = Sun_Diffuser_Calibration (ND filter in) 17 = Nadir_eclipse (pointing) 18 = Nadir_eclipse (scanning) 19 = White_Lamp_Diffuser_Monitoring 20 = Dark_Current_Calibration Hot_Mode 21 = NDF_Monitoring_Filter-OUT 22 = NDF_Monitoring_Filter-IN 23 = Sun_ASM-Diffuser_Calibration 24 = Nadir_Pointing_LEFT

25 = Sun_ASM-Diffuser_Atmosphere
 26 = Limb-Mesosphere

In fig. 5, the relation between the State Index table, the Co-Adding table and the Cluster Definition table is shown. It can be read as follows: For low data rates when executing state i, the cluster definition as listed in Cluster Definition table k is selected. This definition is associated with the co-adding scheme of Co-Adding table j. Each table consists of 64 identical Cluster Indices. All co-adding factors of table j are applied to the corresponding clusters of table k. Fig. 5 depicts an example where a co-adding factor f is applied to the cluster with index m and identifier n (the cluster is part of channel l; it starts at pixel l1 and has a length of Dl).

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

5.1.4 State Duration Table

This table defines the duration of state internal time intervals. Only one table of this class exists.

Table Template:

MCMD: SET STATE DURATION TABLE (IOM Reference A6.53)

Columns:

State ID: identifier of state, range = 1-70
 Restart Time: definition of the elapse time between consecutive *RESTART* commands in limb mode in number of BCPS pulses;
 range = 1-255
 (1 BCPS = 62.5 msec)
 (SDPU) Mode: selection of measurement mode for SDPU; range = 0/1
 0 = standard, continuous measurement
 1 = limb mode, no data processing from elevation steps
 SDPU Duration (Number of BCPS): definition of SDPU measurement mode in number of BCPS,
 range = 0 to $2^{16}-1$
 Wait Measurement Execution - WM: definition of the RTCS Wait parameter WM (the time to wait for the termination of the nominal scan, i.e. excluding the last phase of a state, in CT (1 CT = 3.90625 msec);
 range = 0 to $2^{32}-1$
 State Duration: definition of the total duration of the state, including all phases of the state (equivalent to the RTCS execution time) in CT; range = 0 to $2^{32}-1$
 Scanner Reset Wait - WSR: definition of the RTCS Wait parameter WSR (the time to wait for the termination of the last phase of a state) in CT;
 range = 0 to $2^{16}-1$

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

5.1.5 Co-Adding Table

A Co-Adding table exists for each co-adding index, i.e. the total number of tables in this class is 70 (the equality of the number of co-adding tables and the number of states is only accidental). Each Co-Adding table stores consecutively 64 co-adding factors.

Table Template:

MCMD: SET CO-ADDING TABLE (IOM Reference A6.33)

Rows:

Cluster Index: identifier of the cluster (it refers to the Cluster Index in the Cluster Definition)

Co-Adding Factor: Table - see chapter 5.2.4); range = 1-64 (maximum)
 number of co-addings to be applied to the pixel data in a cluster;
 range = 1-64 (maximum)
 1 = no co-adding applied
 n, $1 < n \leq 64$ (n data words will be co-added)

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

OCR	Issue date	issued by	Title	Co-Adding Table affected
OCR_007	07.Jul.03	SRON	Revision of calibration states 67, 8, 16 and 48	50

5.1.6 Detector Cmd Words

The table Detector Cmd Words defines the parameters for the non state dependent settings of the 8 detector channels. The table is set by the identical MCMD as the DME ENABLE list. Only one table of this class exists.

Table Template:

MCMD: SET DETECTOR COMMAND WORDS (IOM Reference A6.34)

Header Line: spans the area of information for the Detector Cmd Word

Columns

DME DEC: ID of the detector module electronics
 Exp. Time Factor: parameter not delivered from this table to the SDPU
 Mode BIN: defines the operational mode. Set to default value '00'.
 Range: 00 – 01
 channel 1 – 5 normal mode
 channel 6 – 8 state dependent defined by MCMD - SET HOT MODE
 Section Address DEC: defines the intersection of the 2 virtual channels of a detector
 applies to channel 1 – 5 only
 Range: 1 – 511; '0' used if no virtual channels are defined
 Ratio BIN: parameter not delivered from this table to the SDPU. Set to default value
 '00001'.
 applies to channel 1 – 5 only
 Control BIN: parameter not delivered from this table to the SDPU. Set to default value '01'.
 Comp Mode BIN: defines the setting of the 'Offset' compensation.
 applies to channel 6 – 8 only
 Range: 00 – 11
 Fine Bias Setting BIN: adjusts the setting of the 'Bias' voltage.
 applies to channel 6 – 8 only
 Range: 000 – 111
 Short PET BIN: defines PET in HOT MODR (not delivered from this table to the SDPU)
 applies to channel 6 – 8 only

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

5.1.7 DME ENABLE List

The table DME ENABLE list defines if one of the 8 detector channels is enabled/disabled. The table is set by the identical MCMD as the Detector Cmd Words table. Only one table of this class exists.

Table Template:

MCMD: SET DETECTOR COMMAND WORDS (IOM Reference A6.34)

Columns

DME DEC: ID of the detector module electronics
Enabled/Disabled BIN: defines if the DME is activated.
Range: 0 –1

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

No corrections to above table were introduced.

5.2 COMMON Parameter Tables

5.2.1 Basic Scan Profile Table

This table defines the parameters for the Basic Scan Profile. Only one table of this class exists.

Table Template:

MCMD: SET SCANNER BASIC PROFILES (IOM Reference A6.45)

Columns:

Basic Scan Profile Identifier:	identifier of Basic Scan profile; range = 0-14
Basic Scan Position Azimuth:	definition of the scanner azimuth start position of a basic scan profile in μ rad; range = -6283185 to 6283185 (-2π to 2π)
Basic Scan Rate Azimuth:	definition of the scanner azimuth scan rate in μ rad/sec; range = -32768 to 32767 (-0.032768 to +0.032767 rad/sec)
Basic Scan Position Elevation:	definition of the scanner elevation start position of a basic scan profile in μ rad; range = -6283185 to 6283185 (-2π to 2π)
Basic Scan Rate Elevation:	definition of the scanner elevation scan rate in μ rad/sec; range = -32768 to 32767 (-0.032768 to +0.032767 rad/sec)

Note that the Basic Scan Profile parameters are preliminary. They are subject to change based on present testing activities and the results of a detailed orbit analysis, in particular the visibility of celestial objects within the IFOV.

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

5.2.2 Relative Scan Profile Table

The relative scan profile is superimposed onto the basic scan profile. Each table describes the parameters for one Relative Scan Profile. Six tables of this class exists.

Table Template:

MCMD: SET SCANNER RELATIVE PROFILE (IOM Reference A6.48)

Columns:

Common parameter: parameters, applicable to the entire profile (columns 3 -8)
note that the term "common" is only used locally; it does not refer to the COMMON parameters (chapter 5.2)

Segment 1 - Segment 8/16: identifier of the segment of the Relative Scan Profile; the maximum number of segments is given by the row parameter *Number of used Segments* (segments are sub-divisions of a profile)

Rows:

Number of used Segments: number of segments used for the construction of the profile; range = 1-16 (identical to columns 3-10)

Duration of Segment (msec): duration of a segment in msec; range = 0-65535

Angular variation (μ rad): definition of the difference between the angle at the end of the segment and the angle at the start of the profile in μ rad;
range = -6283185 to 6283185 (-2π to 2π)

Acceleration at Start of Segment (mrad/sec^2): definition of the acceleration at the start of a segment in mrad/sec^2 ; range = -32768 to +32767

Acceleration at End of Segment (mrad/sec^2): definition of the acceleration at the end of a segment in mrad/sec^2 ; range = -32768 to +32767

Number of Support Points: selection of number of support points for the calculation of the acceleration function (the position between support points is derived by linear interpolation; range = 0-255)

BCPS Synchronisation: selection of synchronisation mode at start of a segment; range = 0/1
0 = no synchronisation
1 = synchronisation (start when a BCPS is received)

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

5.2.3 Cluster per Channel Table

This table defines the number of clusters in each channel. Only one table of this class exists.

Table Template:

MCMD: SET CLUSTERS PER CHANNEL (IOM Reference A6.32)

Columns:

Cluster Table ID: identifier of the corresponding Cluster Table Index; range = 1-4
Channel 1 - Channel 8: number of clusters within the particular detector channel;
range = 1a-8

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

EEPROM – ICU_SW V. 2.03[illegible]

5.2.4 Cluster Definition Table

This table defines the clustering scheme. A total of four tables of this class exist, corresponding to the number of different clusterings.

Table Template:

MCMD: SET CLUSTER DEFINITIONS (IOM Reference A6.31)

Rows:

Channel: identifier of the channel; range = 1a-8 (channels 1 and 2 are subdivided into 2 separate channels)
 Cluster Index: identifier of the cluster; range = 1-64 (maximum)
 Cluster Identifier: identifier of a cluster within a particular channel, i.e. channel cluster counter; range = 0-15
 Start Pixel: definition of the start pixel of a cluster; range = 0-8191
 note that the numbering is continuous through all channels
 Length: definition of the number of pixels contained in a cluster; range = 1-1024

Note that the Cluster Definition 4 is presently defined for test purposes only and therefore not used operationally.

At time of issue the following OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

6 Timeline and RTCS Tables

As pointed out in chapter 3, the execution of timelines requires access to tables which have to be defined outside the frame of STATE and COMMON Parameter tables. Such tables are the

- ⇒ RTCS Table
- ⇒ STATE RTCS INDEX Table
- ⇒ TIMELINE INDEX Table
- ⇒ TIMELINE Table

6.1 RTCS Tables

6.1.1 RTCS Table

This table stores 1000 Primitive Command Entries. Only one table of this class exists.

Table Template:

MCMD: SET RTCS (IOM Reference A6.43)

Columns:

Entry ID:	identifier of the corresponding Primitive Command; range = 1-1000
Delta Time:	definition of relative time tag in CT w.r.t. start of previous command, range = 0-32765 (equivalent to 0-127.99 sec)
Command Header:	title of Primitive Command

Note that the following table shows only the general layout for the first 53 entries. The full information about the RTCS-table is given in chapter 8 covering all Engineering Parameter Tables.

Entry ID	Delta Time	Command Header

6.1.2 STATE RTCS INDEX Table

This table stores the Start ID of the RTCS associated with each state. Only one table of this class exists.

Table Template:

MCMD: SET STATE RTCS INDEX TABLE (IOM Reference A6.55)

Columns:

Start Index: identifier of the entry number of the first primitive command of the RTCS in the RTCS Table; range = 1-1000;
note that the 70 Start Indices are listed sequentially corresponding to an implicit sequence of state IDs, the latter starting at state ID=1 and ending at state ID=70 (as depicted in the list of states right to the RTCS Index table)

At time of issue no OCR's are affecting the table content of the ICU EEPROM.

6.2 Timeline Tables

6.2.1 TIMELINE INDEX Table

This table stores the identifiers of the start entry in the TIMELINE Table for the 63 instrument_timelines. Only one table of this class exists.

Table Template:

MCMD: SET TIMELINE INDEX TABLE (IOM Reference A6.58)

Columns:

Timeline ID:	identifier of the onboard instrument_timelines; range = 1-63
Start ID Timeline:	identifier of the Entry ID of the first state of an instrument_timeline in the TIMELINE Table; range = 1-4096; for instrument_timelines not loaded in the ICU, the start index "0" must be used - see IOM for more details

The following table shows the definition as it was agreed between all parties to construct a firm template for all timelines. By using this fixed layout the flexibility of the MCMD is intentionally truncated.

Note: the content of this table is fixed and it is not planned to introduce any changes into this table.

6.2.2 TIMELINE Table

This table stores the state sequences for the 63 onboard instrument_timelines. The table has 4096 entries. Only one table of this class exists.

Table Template:

MCMD: SET TIMELINE (IOM Reference A6.57)

Columns:

Entry ID:	position identifier of a particular state in the TIMELINE table; range = 1-4096
Time Tag:	definition of the start time of a particular state relative to the time tag of the preceding state in CT (for the first state in an instrument_timeline this parameter refers to the time tag of the <i>START TIMELINE</i> MCMD), range = 0-16777215 (equivalent to 0-65535.996 sec)
State ID:	identifier of a particular state in an instrument_timeline, range = 1-70

Note that the following table shows only the general layout (template) for the first 53 entries. RD 3 gives the full definition of all timelines contained in the TL-store. Furthermore RD3 will specify in the final issue also the contents (distinguished by a 'set'-nr.) of the TL-store for the different scenarios.

7 Open Issues w.r.t. State Parameter Tables

The instrument states as presented here are based on the current knowledge about SCIAMACHY performance and operations after the definition of the first set of 'Final-Flight'-state parameter tables.

A source for potential state modifications is the behaviour and aging of instrument components with proceeding instrument lifetime and ongoing measurement activities in space. Results of instrument monitoring activities might require to tune certain parameters to the actual instrument status.

8 Engineering Parameter Tables

This chapter describes all remaining SCIAMACHY instrument onboard tables. All of these tables have the purpose to maintain the correct technical functions of the subsystems of SCIAMACHY and of the overall instrument.

The individual engineering tables permit the parameterised setting of different tasks like:

- Monitoring
- Timing and Commanding
- Initialising of Corrective Actions
- Setting of Engineering Parameters for Subsystems and Mechanisms

The engineering tables are considered as a fairly stable part of the onboard EEPROM. When in the following the tables are reproduced the EEPROM parameter version is given and the current RAM table version is not presented with all parameters but only with the altered ones on the appropriate pages. The reason for this diverting approach is, that with engineering parameter tables just a small, very limited number of modifications has occurred since the last burning of the EEPROM. Furthermore it is planned to load these modifications via fixed commands and not via the table interface - CTI. This means the related fixed commands are part of a distinct procedure (see RD1).

8.1 Monitoring Tables

The Engineering tables related hereto are all organised according to the ID-number of the parameter defined. When an ID is cited in any of these tables the identical parameter is designated by this ID. The following 3 tables are all related to only one Excel source file and can be derived therefrom:

1. Monitoring Table
2. Enable Monitoring Table
3. Inhibit Monitoring Table

In the following these 3 tables are described based on the template of the common Excel source and the common Excel source is depicted.

8.1.1 Monitoring Table

This table holds the status or limits against which a parameter defined by its ID is checked. The table is limited to 255 parameters. Only one table of this class exists.

Table Template:

MCMD: SET MONITORING (IOM Reference A6.40)

Header Line:

Checking State: identification of a distinct checking state for the application of the monitoring limits

Columns:

Parameter ID:	identifies a particular instrument parameter against which status or limits are checked; range = 1...255 (column 1 - DEC; column 3 - HEX)
Enabled/Disabled:	not used for Monitoring Table
Type & m-Length:	combines 2 parameters:

Type:	‘0’ defines a set of expected states against which a digital parameter is monitored; ‘1’ defines a value range for the monitoring of analog/digital parameters;
m-Length:	defines the number of word of the microcommand (value = 4);
Filter:	defines the number of tolerated status deviations (type 0) or limit violations (type 1), before a history entry is generated;
Checking State:	Identifier of the checking state for the application of the monitoring limits (see header line)
High Limit or State 1:	with ‘type 0’ this parameter defines state 1 permitted with ‘type 1’ this parameter defines the maximum value permitted
Low Limit or State 2:	with ‘type 0’ this parameter defines state 2 permitted with ‘type 1’ this parameter defines the minimum value permitted

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

8.1.2 Enable Monitoring Table

This table holds the parameters defined by its ID, which are individually enabled for monitoring. The table is limited to 255 parameters. Only one table of this class exists.

Table Template:

MCMD: ENABLE MONITORING (IOM Reference A6.7)

Header Line:

Checking State: identification of a distinct checking state for the application of the monitoring limits

Columns:

Parameter ID: identifies a particular instrument;
range = 1...255 (column 1 - DEC; column 3 – HEX)
Enabled/Disabled: parameters marked '**enabled**' are identified for monitoring

Type & m-Length: not used for Enable Monitoring Table
Filter: not used for Enable Monitoring Table
Checking State: Identifier of the checking state for which the monitoring applies (see header line)
High Limit or State 1: not used for Enable Monitoring Table
Low Limit or State 2: not used for Enable Monitoring Table

NOTE: MCMD 'Enable Monitoring' may also be used to globally enable monitoring, which does not alter the setting of the individual parameter.

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

CDR/OCR	Issue date	issued by	Title
none			

8.1.3 Inhibit Monitoring Table

This table holds the parameters defined by its ID, which are individually inhibited for monitoring. The table is limited to 255 parameters. Only one table of this class exists.

Table Template:

MCMD: INHIBIT MONITORING (IOM Reference A6.7)

Header Line:

Checking State: identification of a distinct checking state for the application of the monitoring limits is inhibited

Columns:

Parameter ID: identifies a particular instrument;
range = 1...255 (column 1 - DEC; column 3 - HEX)
Enabled/Disabled: parameters marked '**disabled**' are specified for monitoring
Type & m-Length: not used for Inhibit Monitoring Table
Filter: not used for Inhibit Monitoring Table
Checking State: Identifier of the checking state for which the monitoring is inhibited (see header line)
High Limit or State 1: not used for Inhibit Monitoring Table
Low Limit or State 2: not used for Inhibit Monitoring Table

NOTE: MCMD 'Inhibit Monitoring' may also be used to globally inhibit monitoring, which does not alter the setting of the individual parameter.

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

8.2 Corrective Action Tables

The Engineering tables related hereto are also all organised according to the fault ID-number of the parameter defined. When an ID is cited in any of these tables the identical parameter is designated by this ID.

The following 3 tables are all related to only one Excel source file – Corrective Action Mask - and can be derived therefrom:

1. CA_Mask
2. Enable Autonomous Switching
3. Inhibit Autonomous Switching

In the following these 3 tables are described based on the template of the common Excel source and the common Excel source is depicted.

A further table – CA_matrix – is related to above 3 tables. This tables defines for the identical set of Fault Ids, which CA is assigned to a particular Fault ID as a function of instrument mode or transition to mode. The Excel sheet related hereto is depicted after the picture of the CA_Mask.

8.2.1 CA_Mask Table

This table holds the information, for which Fault IDs a fault handling action shall be enabled/inhibited. The table is limited to 1023 Fault IDs.

Table Template:

MCMD: SET CA_MASK (IOM Reference A6.29)

Columns:

Fault ID: identifies a particular fault ID for which the fault handling action shall be enabled/inhibited; for details see chapt.10 of RD1;
range = 256....1022 (column 1 - DEC; column 3 – HEX); ID 256....1022 are generated in the instrument SW
fault ID range 1...255 is mapped on parameter ID range 1...255. Fault ID 0 is default and not checked. With fault ID range 1...255 the MCMDs Enable Autonomous Switching and Inhibit Autonomous Switching are used.

CA_Mask: specifies whether fault handling for the quoted Fault ID is enabled/inhibited (column 2 – HEX – 0 / 1 -; column 6 – alphanumeric)

SP EID Dec & HEX: not used for CA_Mask

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

DCR/OCR	Issue date	issued by	Title
e-mail	e-mail 20.08.2002	H.Kröger; Astrium	correct CA-Mask for fault 86 to be disabled

8.2.2 Enable Autonomous Switching Table

This table holds the information, for which Parameter IDs an autonomous switch-down function shall be enabled as a CA in response to out-of-limit conditions of this parameter. The table is limited to 255 parameters. By default CA execution is enabled for all parameters.

Table Template:

MCMD: ENABLE AUTONOMOUS SWITCHING (IOM Reference A6.6)

Columns:

Fault ID: identifies a particular fault ID for which the fault handling action shall be enabled; for details see chapt.10 of RD1; A Fault ID is generated in the ICU as a result of limit checking and/or other detected faults.
Fault ID range 1...255 is mapped on parameter ID range 1...255. Fault ID 0 is default and not checked.
range = 256....1022 not used for this table

CA_Mask: not used for this table

SP EID Dec & HEX: not used for this table

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

DCR/OCR	Issue date	issued by	Title
none			

8.2.3 Inhibit Autonomous Switching Table

This table holds the information, for which Parameter IDs an autonomous switch-down function shall be inhibited as a CA in response to out-of-limit conditions of this parameter. The table is limited to 255 parameters. By default CA execution is enabled for all parameters.

Table Template:

MCMD: INHIBIT AUTONOMOUS SWITCHING (IOM Reference A6.16)

Columns:

Fault ID: identifies a particular fault ID for which the fault handling action shall be inhibited; for details see chapt.10 of RD1;
fault ID range 1...255 is mapped on parameter ID range 1...255. Fault ID 0 is default and not checked.
range = 256....1022 not used for this table

CA_Mask: not used for this table

SP EID Dec & HEX: not used for this table

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

DCR/OCR	Issue date	issued by	Title
none

8.2.4 CA_Matrix Table

The Engineering tables related hereto are also all organised according to the fault ID-number of the parameter defined. When an ID is cited in any of these tables the identical parameter is designated by this ID.

The CA_Matrix defines for a particular Fault Id, which CA is assigned to it as a function of instrument mode or transition to mode.

The table is limited to 1023 Fault IDs.

Table Template:

MCMD: SET CA_MATRIX (IOM Reference A6.30)

Header Line:

CA ID HEX: covers the Transition to Mode & Current Mode entry area for the particular CA to be applied

Columns:

Fault ID: identifies a particular fault ID for which the appropriate fault handling action shall be defined; for general flow diagramme see chapt.10 fig. 10-6 of RD1; range = 1....1023 (column 1 - DEC; column 2 – HEX);

Transition to: fault ID 1023 is assigned to EQSOL
columns 3,5,7,9,11,13,15,17
specifies which fault handling action – CA applies for the Fault ID in the transition to the quoted mode

Current Mode: columns 4,6,8,10,12,14,16,18
specifies which fault handling action – CA applies for the Fault ID in the quoted mode

At time of issue the following CCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via MCMD.

DCR/OCR	Issue date	issued by	Title
DR-SCIA-0004DO/00	27.07.00	DSS	Correction of CA-matrix due to Patch & Dump handling problems
e-mail P.Lützow	16.09.2002	Astrium	fault ID 0796 to be treated acc. to DR-SCIA-0004DO/00

Table 21 of 21

[illegible]

8.3 Control tables

All tables of this grouping are related to characteristics of instrument controls. This covers mechanisms, drives and the thermal control.

8.3.1 Scanner constants

This table holds all values of the constants used in the scan algorithms. All parameters listed have their particular calibration. For details about a single parameter see RD7.

Table Template:

MCMD: SET SCANNER CONSTANTS (IOM Reference A6.46)

Columns:

Column 1: gives the alphanumeric name of the parameter
Parameter: specifies the value of the parameter in calibrated engineering units

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

Note: The tables given in this chapter are reflecting only the parameter settings for the inflight configuration ID 15 & 16.

8.3.2 Scanner Control Parameters

This table holds the PID-controller parameters used for the scanner position control. All parameters listed have their particular calibration. For details about a single parameter see RD7.

Table Template:

MCMD: SET SCANNER CONTROL PARAMETERS (IOM Reference A6.47)

Columns:

Column 1: gives the alphanumeric name of the parameter
Parameter: specifies the value of the parameter in calibrated engineering units

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

DCR/OCR	Issue date	issued by	Title

elevation total inertia of rotating system (I_pl)	0,000358
elevation sampling interval (T_c)	00,001
elevation integration limitation threshold (Y_dMax)	00,002

8.3.3 Thermal Control Parameters

This table holds the thermal control parameters. All parameters listed have their particular calibration.

Table Template:

MCMD: SET THERMAL CONTROL (IOM Reference A6.56)

Columns:

Parameter ID: gives the parameter ID
 ATC_OBM Parameter gives the alphanumeric name of the parameter
 EU: specifies the value of the parameter in calibrated engineering units

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

Note: The tables given in this chapter are reflecting only the parameter settings for the inflight configuration ID 15 & 16.

As the thermal status of the instrument is subject to change due to external and internal thermal conditions, some parameters of this table (ID 37 to 46) are changed as result of the thermal monitoring activities - see IOM chapt 12.3.2.2 PIN_401 & PIN_402. The latest status of these changes is always displayed on the web-site of SCIAMACHY Operations Support :

<http://atmos.af.op.dlr.de/projects/scops/>

8.3.4 Mechanism Control Parameters

This table holds the parameters defining the pulse duration for the actuator drives.

Table Template:

MCMD: SET MECHANISMS CONTROL (IOM Reference A6.38)

Columns:

Mechanisms: gives the drive group and drive nomenclature
Drive pulse duration specifies the value of the parameter in seconds

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

DCR/OCR	Issue date	issued by	Title
none			

EEPROM – ICU_SW V. 2.03

Mechanism		Drive Pulse Duration
LAT Mechanisms	NC	0,30
	AS	0,30
	ND	0,30
MAD Mechanisms	AZ Cover	0000,0
	ELV Cover	0000,0
	SRC Door	0000,0

8.4 Command tables

All tables of this grouping are related to commanding of timing sequences and the definition of conditions, when these sequences are applicable. This covers the Relative Time Command Sequences (RTCS) and the tables specifying mode switching and non-mode switching MCMD's.

8.4.1 RTCS Table

This table holds a total of max. 1000 parameters defining the timing of the various RTCS. Presently 29 different tables of this class exist.

Table Template:

MCMD: SET RTCS (IOM Reference A6.43)

Columns:

Counter DEC: entry number of the parameter in the RTCS pool
 Δ TT HEX: specifies the HEX-value of the delta time in ct (1/256 s)
 CMD HEX: specifies the HEX-value of the 16-bit header word of the primitive CMD used at this RTCS entry
 Parameter Type : specifies whether the delta time parameter is coded directly in delta time (immediate) or shall be taken from either the RTCS_WAITS table or the STATE_DURATION table
 DT_ID: supplementary information; gives the alphanumeric name of a parameter to be taken either from the RTCS_WAITS table or from the STATE_DURATION table
 Δ TT DEC: supplementary information; gives the alphanumeric name resp. the decimal value of the delta time
 Destination: supplementary information; gives the destination of the primitive CMD
 CMD_Type: supplementary information about the type of primitive CMD
 Command_Header: supplementary information; gives the alphanumeric name of the primitive CMD specified in column 'CMD HEX'
 Note: supplementary information; quotes at the start entry of the RTCS the abbreviated name of the RTCS or 'SPARE', when not used

At the bottom of each of the 20 tables for information purposes the duration of the specified RTCS is given (units are ct's). To this sum the values of all 'WAITS' have to be added where applicable.

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

DCR/OCR	Issue date	issued by	Title	RTCS table affected

8.4.2 RTCS Waits Table

This table holds the ‘WAIT’ parameters in the ICU, which may be used instead of a delta time within a RTCS

Table Template:

MCMD: SET RTCS WAITS (IOM Reference A6.44)

Columns:

WAIT Description: gives the abbreviated name of the WAIT parameter
WAIT Parameter HEX: specifies the HEX value of the parameter in ct
WAIT Parameter DEC: specifies the DEC value of the parameter in ct
WAIT ID HEX: specifies the HEX name of the WAIT as used in the RTCS pool

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

DCR/OCR	Issue date	issued by	Title
none			

Wait Description	Wait parameter HEX	Wait parameter DEC
WSH0	001C2000	1843200
WSH1	002A3000	2764800

8.4.3 RESET Index Table

This table contains the START indices for the RTCS used for the RESET commanding depending on the current mode of the ICU. There is only one table of this class.

Table Template:

MCMD: SET RESET INDEX TABLE (IOM Reference A6.42)

Columns:

Column 1: gives the name of the current mode
Start index/fault ID
HEX gives the HEX value of the START index of the RTCS to be applied for the transition
ALPHAN gives the abbreviated name of the RTCS to be applied for the transition
DEC gives the DEC value of the START index of the RTCS to be applied for the transition

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

DCR/OCR	Issue date	issued by	Title
none			

RESET_INDEX_TABLE

Table 1 of 1

HEATER/ REFUSE	012D	HRF_HTR	301

8.4.4 Mode_Mode_Matrix

This table holds the information specifying of a mode switching request is permitted depending on the current mode resp. the transition to a mode the ICU is in at time of receiving this request. There exist 8 tables of this class.

Table Template:

MCMD: SET MODE_MODE MATRIX (IOM Reference A6.39)

Header line: every 4 columns the information for each one of the request types is repeated.

HEX: request type ID HEX

Alphan: alphanumeric name of request type

Columns:

Column 1: names the Current Mode resp. the Transition to a Mode
 HEX sub-column 1 specifies if the mode switching request is permitted (0 / 1)
 HEX sub-column 2 specifies the HEX value of the START entry of the RTCS to be used
 Alphan sub-column 1 repeats as word if the mode switching request is permitted
 Alphan sub-column 2 gives the name of the RTCS to be used resp. in case the request is not permitted the fault ID for the CA to be applied

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

DCR/OCR	Issue date	issued by	Title
none			

Table 1 of 1

[illegible]

8.4.5 AUX_MCMD_Mode_Matrix

This table holds the information specifying of a nonmode switching (auxiliary) MCMD is permitted depending on the current mode resp. the transition to a mode the ICU is in at time of receiving this MCMD. In case the MCMD is not permitted the fault ID for the CA is specified. There exist 66 tables of this class.

Table Template:

MCMD: SET AUX_MCMD_MODE MATRIX (IOM Reference A6.28)

Header line: every 4 columns the information for each one of the MCMDs listed is repeated.

Columns:

Column 1: names the Current Mode resp. the Transition to a Mode
 HEX Allowed: specifies if the mode switching request is permitted (0 / 1)
 HEX Fault ID: if allowed, specifies the HEX value of the START entry of the RTCS to be used
 : if not allowed, specifies the HEX value of the fault ID for the CA to be applied
 DEC Allowed: same as HEX Allowed
 DEC Fault ID: if allowed, specifies the DEC value of the START entry of the RTCS to be used
 : if not allowed, specifies the DEC value of the fault ID for the CA to be applied

At time of issue the following DCR's or OCR's are affecting the table content of the ICU EEPROM such, that the consequent modifications are subject to RAM-updates via fixed MCMD.

A Annex

A.1 Support Tables

The tables presented in chapters 5 and 6 are in a format as required by the instrument from a systems point of view (ground and space segment). However, to clearly understand the properties of individual states in some cases we feel it necessary to alter or even supplement such state parameter information.

In Annex 1 we list several tables serving this purpose. When any of these tables reflects parameters, which were called up already in the earlier tables but in differing units or context, then these parameters are given in the following tables always in the up to date value and not in the EEPROM value. Insofar we present only parameters corresponding to Table_version 21.004.

A.1.1 Pixel Exposure Time Parameter (sec)

This table gives the pixel exposure times for all states, both for the low and the high data rate, in seconds. It is equivalent to the Pixel Exposure Time parameter table in chapter 5.1.2 where the PETs are listed in Engineering Units (EU).

Table Template:

Columns:

State ID:	identifier of state
Data Rate:	data rate for which the exposure times apply; the Pixel Exposure Time (PET) is specified separately for high and low data rate
Channel 1a - Channel 8:	PET in SCIAMACHY measurement channels (including the separation of the first two channels into virtual channels) in seconds

Note that the indices given on the right hand side of the table (e.g. N1-N8, L1-L7, etc.) define individual PET sets. Their nomenclature starting with state 46 is self explanatory. "N" stands for "Nadir" and "L" for "Limb". A summary of these PET sets and their connection to coadding tables applied is found in the next chapter (A1.218)

State ID	Data Rate	Channel 1a	Channel 1b	Channel 2b	Channel 2a	Channel 3	Channel 4	Channel 5	Channel 6	Channel 7	Channel 8	corresponding PET/Coadd-table

A.1.2 Integration Time

This table summarises the relation between PETs and Co-Adding factors for different measurement categories. The identifier of each Integration (PET*Co-Adding) table is used in several other support tables and in the state summary table in chapter 4.

Table Template:

Rows: alternating

Clusterindex:	running index of the cluster in subsequent channel; in the electronic pdf formats cluster indices are colour coded for the different channels
Integration Time (s):	Pixel Exposure Time multiplied by the coadding factor applicable. Co-Adding Factor applied corresponds to the nominally used data rate. For clusters in Hot Mode the effective integration time is given.

Dark current table 5

A.1.3 State Duration (sec)

This table defines the duration of state internal time intervals in seconds. It is equivalent to the State Duration parameter table in chapter 5.1.5 where all times are listed in Engineering Units (EU).

Table Template:

Columns:

State ID:	identifier of state
Restart Time:	definition of the elapse time between consecutive <i>RESTART</i> commands in limb mode in seconds
(SDPU) Mode:	selection of measurement mode for SDPU, either "Standard" or "Limb"
SDPU Duration (Number of BCPS):	definition of SDPU measurement mode in seconds, corresponds to the duration of scan phases 2 to n-1
Wait Measurement Execution - WM:	definition of the RTCS Wait parameter WM (the time to wait for the termination of the nominal scan, i.e. excluding the last phase of a scanner state) in seconds
State Duration:	definition of the total duration of the state, including all phases of the state (equivalent to the RTCS execution time) in seconds
Scanner Reset Wait - WSR:	definition of the RTCS Wait parameter WSR (the time to wait for the termination of the last phase of a state) in seconds

Final-Flight_Vers.FF10

A.1.4 RTCS Duration

The RTCS Duration table shows how long the individual phases of a state will last. It supplements the State Duration table (chapter 5.1.5).

Table Template:

Columns:

Measurement Category Name:	identifier of measurement category, appended by a sequential counter for identical categories
State ID:	identifier of the state
RTCS:	identifier of the applicable RTCS
T Measurement Phase n (nominal), n=1-6:	duration of all phases within the measurement window of a state in seconds; the activities of each phase are described in A 2; <u>phases for the transition at the beginning and end of a state are not listed</u> ; note that Measurement Phase 6 is currently unused
Nominal Measurement Duration:	duration of measurement window as defined in seconds
Max. Integration Time:	maximum duration for integration of science data before submission to data packeting in seconds
T Set Up:	time required for preparing the instrument to execute the measurement of the state in seconds
T Measurement:	time required to execute the measurement phase of the state in seconds
T Clean Up:	time required to bring the instrument back from measurement to nominal configuration in seconds
SDPU Duration (sec):	definition of SDPU measurement mode in seconds
Wait Measurement Execution - WM:	definition of the RTCS Wait parameter WM (the time to wait for the termination of the nominal scan, i.e. excluding the last phase of a state, in seconds
State Duration:	definition of the total duration of the state, including all phases of the state (equivalent to the RTCS execution time plus add. 4 cts) in seconds
Scanner Reset Wait - WSR:	definition of the RTCS Wait parameter WSR (the time to wait for the termination of the last phase of a state) in seconds

Table not updated and deleted

A.1.5 Co-Adding

The relation between State identifier, Co-Adding, Cluster definition, PETs and the data rates is summarized in the following table. It provides an overview of which combinations of these quantities are presently defined. Co-Adding Table IDs without assigned other parameters are not used.

Table Template:

Columns:

Coadding Table ID:	identifier of the Co-Adding table; the Co-Adding tables are given in chapter 5.1.6
Cluster Definition Index:	selection of the clustering scheme; the Cluster Definition table is given in chapter 5.2.4
PET:	set of PETs as defined in the Pixel Exposure Time parameter support table (chapter A 1.1)
Data Rate:	data rate for which the exposure time set applies

Final-Flight_Vers.FF10

* NOTE

For N1 - N7 with cluster definition index = 3 the corresponding
PET/Coadd-table applies only for PET.
The used PET/Coadd-table represents the nominal T-INT.

A.1.6 Cluster Definition

This table provides supporting information for the definition of the clusters. It supplements the Cluster Definition table in chapter 5.2.4. For each cluster definition (indicated at top of each table), the clustering within all 8 channels is given.

Table Template:

Upper section:

Columns:

Channel ID:	identifier of the channel; range = 1-8
Channel - Start Pixel:	identifier of the first used pixel in the channel (excluding blinded pixels); range = 0-1023
Channel - End Pixel:	identifier of the last used pixel in the channel (excluding blinded pixels); range=0-1023
Channel - Length:	number of used pixels in the channel (End Pixels- Start Pixel+1)
Channel Wavelength - Min:	Start Pixel expressed in nm
Channel Wavelength - Max:	End Pixel expressed in nm

Lower section:

Columns:

Cluster ID:	identifier of the cluster within the channel (including clusters with unused and blinded pixels); range = 0-15
Cluster - Start Pixel:	identifier of the first pixel in the cluster
Cluster - End Pixel:	identifier of the last pixel in the cluster
Cluster - Length:	number of pixels in the cluster (End Pixels- Start Pixel+1)
Cluster Wavelength - Min:	Start Pixel expressed in nm (only for clusters with used pixels)
Cluster Wavelength - Max:	End Pixel expressed in nm (only for clusters with used pixels)
Description:	characterisation of unused and blinded pixels, virtual channels, overlaps and major measurement targets (AE = aerosols)
Cluster Index:	identifier of the cluster; range = 1-64 (maximum)
Cluster Identifier:	same as "Cluster ID"
Start Pixel:	same as "Cluster - Start Pixel"
Length:	same as "Cluster - Length"

1024

Note: lower limit of PMD 1
should be 307 nm, but this is
outside of channel limits

A.1.7 Scan Profiles

Four support tables are listed. They provide a short description of the purpose of each Basic Scan Profile (one for azimuth and one for elevation - see chapters 5.1.1 and 5.2.1), of the Relative Scan Profiles (see chapter 5.1.1 and 5.2.2) and of the correction applied to the Nominal Scan Profile via the Scanner State Parameter tables (see chapter 5.1.1).

Table Template:

Basic Profiles (azimuth and elevation) - Columns:

Basic Scan Profile Identifier:	identifier and purpose of each Basic Scan Profile
Position [10^{-6} rad]:	definition of the scanner start position of a basic scan profile in μ rad (identical to parameters in Basic Scan Profile - 5.2.1)
Position deg:	definition of the scanner start position of a basic scan profile in degree
Rate [10^{-6} rad/sec]:	definition of the scanner rate in μ rad/sec (identical to parameters in Basic Scan Profile - 5.2.1)
Rate deg/sec:	definition of the scanner rate in degree/sec
Description of the intended use of profile:	purpose of corresponding profile

Corrections - Columns:

Description of Correction Function:	identifier and purpose of each correction function applied to the Nominal Scan Profile
-------------------------------------	--

Relative Profile - Columns:

Relative Scan Profile Identifier:	identifier and purpose of each Relative Scan Profile
Rel. Position for factor=1 [10^{-3} deg]:	maximum relativ angular position variation within a Relative Profile in 10^{-3} deg

Azimuth Basic Scan Profile Identifier		Position [10.6 rad]	Position deg	Rate [10.6 rad/sec]	Rate deg/sec	Description of the intended use of profile
0	no scan	0000000000	0.0000	0000000000	0.0000	ASM new position IDLE
1	nadir, all other states without ASM	0000000000	0.0000	0000000000	0.0000	ASM new unused position pointing into telescope, mirror not used
2	limb azimuth scanning / pointing	-0000783398	-45.0000	0000000000	0.0000	ASM pointing in direction of velocity vector (-y)
3	sun pointing / scanning with mirror, start 17.2km above horizon	-0000471239	-27.0000	0000000131	0.0075	ASM following trajectory of sun from position of sunrise
4	sun_asm, diffuser 01 / position 1	0003298672	189.0000	-0000008145	-0.4667	ASM Diffuser 1 - starting position +9 deg diffuser normal
5	moon pointing / scanning with mirror, start 17.2km above horizon	-0001003364	-57.5000	-0000000174	-0.0100	ASM following moon trajectory from mean position of the full moon (245 deg)
6	sun pointing with ESM diffuser	-0000468621	-26.5500	0000000131	0.0075	ASM following sun trajectory
7	scanner maintenance	-0006283185	-360.0000	0000000000	0.0000	ASM position for 360 deg revolution of scanner bearings
8	mirror degradation mode sun pointing / scanning	-0000468621	-26.5500	0000000131	0.0075	ASM following sun trajectory
9	dark current (pointing in flight direction)	-0000783398	-45.0000	0000000000	0.0000	ASM pointing in direction of velocity vector (-y)
10	sun_asm, diffuser 02 / position 2	0003263766	187.0000	-0000008145	-0.4667	ASM Diffuser 2 - starting position +7 deg diffuser normal, ASM diffuser atmosphere
11	sun_asm, diffuser 03 / position 3	0003228859	185.0000	-0000008145	-0.4667	ASM Diffuser 3 - starting position +5 deg diffuser normal
12	sun_asm, diffuser 04 / position 4	0003193953	183.0000	-0000008145	-0.4667	ASM Diffuser 4 - starting position +3 deg diffuser normal
13	sun_asm, diffuser 05 / position 5	0003159046	181.0000	-0000008145	-0.4667	ASM Diffuser 5 - starting position +1 deg diffuser normal
14	in sun direction (elevation 17.2 km above horizon continuously)	-0000471239	-27.0000	0000000227	0.0130	ASM following trajectory of sun from position of sunrise

Elevation Basic Scan Profile Identifier		Position [10.6 rad]	Position deg	Rate [10.6 rad/sec]	Rate deg/sec	Description of the intended use of profile
0	no scan	-0000261799	-15.0000	0000000000	0.0000	ESM position IDLE
1	nadir	-0000794125	-45.5000	0000000000	0.0000	ESM pointing in slightly shifted nadir direction (-z) - start position for nadir pointing left
2	limb azimuth scanning / pointing	-0000237101	-13.5849	0000000000	0.0000	ESM pointing one elevation step below horizon (3 km)
3	sun pointing / scanning with mirror, start 17.2km above horizon	-0000234032	-13.4090	0000000445	0.0255	ESM following sun from start at 17.2 km above horizon (= fix angle of ESM related to F00)
4	sub solar calibration	0000986111	56.5000	0000000000	0.0000	ESM pointing to mean sun elevation within sub-solar window
5	pointing 150km altitude, limb-mesosphere	-0000213649	-12.2526	0000000000	0.0000	ESM pointing at 150 km above horizon
6	sun pointing with ESM diffuser	0002879793	165.0000	0000000000	0.0000	ESM diffuser in fixed ESM pos. of 180-15 deg - timing required for normal incidence of sun on ESM
7	scanner maintenance	-0006283185	-360.0000	0000000000	0.0000	ESM position for 360 deg revolution of scanner bearings
8	mirror degradation mode sun pointing / scanning	0000570714	33.6995	0000000222	0.0127	ESM following sun via extra mirror with half angular velocity from start at 150 km above horizon
9	dark current (pointing 250km altitude), Sun, ASM, diffuser	-0000196437	-11.2550	0000000000	0.0000	ESM pointing at 250 km above horizon
10	internal wavelength calibration with mirror	0000170480	9.7678	0000000000	0.0000	ESM pointing to SLS (9.768 deg)
11	internal wavelength / relative radiometric calibration with diffuser	0003319617	190.2000	0000000000	0.0000	ESM pointing diffuser to internal calibration sources (10.2 + 180 deg)
12	internal relative radiometric calibration	0000183638	10.5228	0000000000	0.0000	ESM pointing to WLS (10.523 deg)
13	WLS - NDF-mirroring, NDFM IN/OUT	0000186279	10.6730	0000000000	0.0000	ESM pointing to WLS under non-optimal angle (10.673 deg)
14	in sun direction (elevation 17.2 km above horizon continuously)	-0000234032	-13.4090	0000000000	0.0000	ESM pointing at 17.2 km above horizon

Final-Flight_Vers.FF10

Description of Correction Function	
0	no correction

6	- fast sweep	84,96964100

A.2 State Description

The following state descriptions summarise the activities within each state. They should be considered as summaries of the measurement performance within each state and as a quick reference guide to understand the sequence of individual state events.

State Descriptions

The state descriptions summarise the activities within each state. They should be considered as summaries of the measurement performance within each state and as a quick reference guide to understand the sequence of individual state events.

The description of each state is given in the form of a table. The table content is as follows

Header.....	state ID with acronym, the measurement type and measurement category
ILOS.....	strategy and targeting of the instantaneous line of sight (ILOS)
Scan.....	type of scan, centre of scan motion, width, number of repetitions and velocity resp. duration
Swath.....	image of the scan of the instantaneous field of view (IFOV) on the earth surface
Measurement Duration.....	measurement duration, partly split into different measurement phases
Exposure Control.....	pixel exposure time
Integration Time.....	range of integration times = pixel exposure time* co-adding
Pixel Size (Ground Pixel).....	spatial resolution (dependant on selected integration time)

The state descriptions presented here are those for nominal operations, i.e. they represent the final flight states as of October 2003 (FFS_021215 incl. OCR_009). This final flight state version had been uploaded December 15th, 2002 and in subsequent corrective mcmd-sequences.

State ID 01 nad01	Scientific measurement	Nadir
ILOS	Description	
	In State 01 the Earth atmosphere is observed centering the line of sight (LOS) towards Nadir. To adjust the ILOS (<u>I</u> ntermediate <u>L</u> ine of <u>S</u> ight), SCIAMACHY uses for the measurement only the nadir/elevation scan mirror (ESM).	
Scan	By the orbital motion the atmospheric volume above the subsatellite point along the ground track is observed during the duration of the measurement. The scan motion of the ESM moves the ILOS in crosstrack direction. The basic position of the ESM is controlled by basic profile 1 a position of -45.5° , corresponding to a slightly shifted nadir-direction (-z) for the ILOS. This shift is to avoid partial obscuration of the nadir pixels on the extreme right side of the scan. The motion of the ESM is controlled by relative scan profile 2, yields an ILOS scan of about 61.6° . This profile produces a relative motion of the ESM (relative to -45.5° basic position) of fixed duration for 4 seconds in positive direction and a flyback (reverse motion) to the original angular position within 1 second. The 4 second forward motion produces a scan of the ground pixel in east-west direction (for the descending north-south pass of the orbit). The resulting swath is reduced by 1° ILOS on its right side and maintains the original angular position on the left side.	
Swath	To adjust the Earth coverage the swath is set to 940 km by setting the scan speed to $16^\circ/\text{s}$. Centering of the scan gives a start position (for the descending north-south pass of the orbit) of the forward scan of 465 km left of the subsatellite point (ESM angular position at approx. -60.9°) and a turnaround position of the backward scan of 475 km right of the subsatellite point (ESM angular position -30.1°).	
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 forward and flyback scans. A stretch of 4.77° of the orbit is passed during this time.	
Exposure control	The exposure of the focal plane linear detector arrays (channels) is controlled by a subset of parameters setting the exposure times of the channels (6 plus 4 virtual) respectively the defined clusters and the corresponding co-adding factors. The exposure parameters for nad01 are set to produce optimal signals for the orbital position 183° . The definitions are summarised in PET table N1.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad01 low rate data they are listed in integration_time table 21.	
Pixel size (Ground pixel)	The ground pixel size is determined by the motion of the <u>I</u> ntermediate <u>F</u> ield of <u>V</u> iew (IFOV) of the instrument of $1.8^\circ * 0.045^\circ$ corresponding to approx. $25 \text{ km} * 0.6 \text{ km}$ on ground - over the atmosphere during the integration time. The motion is a combined motion of the scan mirror and the orbital motion of the spacecraft. Since the integration time is diverse, and the angular speed for forward and flyback is different by a factor 4 the ground pixel size varies between approx. $92 \text{ km} * 960 \text{ km}$ (along track * across track) and approx. $32 \text{ km} * 240 \text{ km}$.	

State ID 02 nad02	Scientific measurement	Nadir
ILOS	Description	
	see state ID 01	
Scan	see state ID 01; speed $16^\circ/\text{s}$	
Swath	see state ID 01; width 940 km	
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 forward and flyback scans. A stretch of 4.77° of the orbit is passed during this time.	
Exposure control	see state ID 01	
	The exposure parameters for nad02 are set to produce optimal signals for the orbital	

	position -3° to 5° and 175° to 183° . The definitions are summarised in table PET table N2 .
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad02 low rate data they are listed in integration_time table 22 .
Pixel size (Ground pixel)	see state ID 01 The ground pixel size varies between approx. 92 km* 960 km (along track* across track) and approx. 32 km* 240 km.

State ID 03 nad03	Scientific measurement	Nadir
ILOS	Description see state ID 01	
Scan	see state ID 01; speed $16^{\circ}/s$	
Swath	see state ID 01; width 940 km	
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 forward and flyback scans. A stretch of 4.77° of the orbit is passed during this time.	
Exposure control	see state ID 01 The exposure parameters for nad03 are set to produce optimal signals for the orbital position 5° to 16° and 164° to 175° . The definitions are summarised in PET table N3.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad03 low rate data they are listed in integration_time table 23.	
Pixel size (Ground pixel)	see state ID 01 The ground pixel size varies between approx. 59 km* 960 km (along track* across track) and approx. 27 km* 60 km.	

State ID 04 nad04	Scientific measurement	Nadir
ILOS	Description see state ID 01	
Scan	see state ID 01; speed $16^{\circ}/s$	
Swath	see state ID 01; width 940 km	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 01 The exposure parameters for nad04 are set to produce optimal signals for the orbital position 16° to 26° and 154° to 164° . The definitions are summarised in PET table N4.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad04 low rate data they are listed in integration_time table 24.	
Pixel size (Ground pixel)	see state ID 01 The ground pixel size varies between approx. 32 km* 240 km (along track* across track) and approx. 26 km* 30 km.	

State ID 05 nad05	Scientific measurement	Nadir
ILOS	Description see state ID 01	
Scan	see state ID 01; speed $16^{\circ}/s$	

Swath	see state ID 01; width 940 km
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.
Exposure control	see state ID 01 The exposure parameters for nad05 are set to produce optimal signals for the orbital position 26° to 36° and 144° to 154°. The definitions are summarised in PET table N5.
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad05 low rate data they are listed in integration_time table 25.
Pixel size (Ground pixel)	see state ID 01 The ground pixel size varies between approx. 32 km* 240 km (along track* across track) and approx. 26 km* 30 km.

State ID 06 nad06	Scientific measurement	Nadir
ILOS	Description see state ID 01	
Scan	see state ID 01; speed 16°/s	
Swath	see state ID 01; width 940 km	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 01 The exposure parameters for nad06 are set to produce optimal signals for the orbital position 36° to 70° and 110° to 144°. The definitions are summarised in PET table N6.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad06 low rate data they are listed in integration_time table 26.	
Pixel size (Ground pixel)	see state ID 01 The ground pixel size varies between approx. 32 km* 240 km (along track* across track) and approx. 27 km* 60 km.	

State ID 07 nad07	Scientific measurement	Nadir
ILOS	Description see state ID 01	
Scan	see state ID 01; speed 16°/s	
Swath	see state ID 01; width 940 km	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 01 The exposure parameters for nad07 are set to produce optimal signals for the orbital position 70° to 110°. The definitions are summarised in PET table N7.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad07 low rate data they are listed in integration_time table 27.	
Pixel size (Ground pixel)	see state ID 01 The ground pixel size varies between approx. 59 km* 960 km (along track* across track) and approx. 27 km* 60 km.	

State ID 08	Calibration	Dark_Current_Calibration
-------------	-------------	--------------------------

dcc05		
ILOS	Description	
	In State 08 the ILOS is pointing in flight direction to an altitude safely above the earth atmosphere (250km above horizon, basic profile 9) to eliminate atmospheric influences on the dark current measurement. To adjust the ILOS, SCIAMACHY uses for the measurement the nadir/elevation scan mirror (ESM) and the azimuth scan mirror (ASM).	
Scan	no scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 40 s.	
Exposure control	The exposure parameters for dcc05 are summarized in PET table Dark_Current_5.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For dcc05 low rate data they are listed in integration_time table 52.	
Pixel size	n.a.	

State ID 09 nad09	Scientific measurement	Nadir
ILOS	Description	
	see state ID 01	
Scan	see state ID 01 To adjust the view to a quasi telescopic close look the swath is set to 117 km by setting the scan speed to 2°/s.	
Swath	The width is set to 'small', i.e. 117 km. Centering of the scan gives a start position of the forward scan of 66 km east (for the descending north-south pass of the orbit) of the subsatellite point (ESM angular position -49,35°) and a turnaround position of the forward scan of 51 km west of the subsatellite point (ESM angular position -41,65°).	
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 forward and flyback scans. A stretch of 4.77° of the orbit is passed during this time.	
Exposure control	see state ID 01 The exposure parameters for nad09 are set to produce optimal signals for the orbital position 183°. The definitions are summarised in PET table N1.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad09 low rate data they are listed in integration_time table 21.	
Pixel size (Ground pixel)	The ground pixel size is determined by the motion of the <u>I</u> ntermediate <u>F</u> ield of <u>V</u> iew (IFOV) of the instrument of 1.8° * 0.045° corresponding to approx. 25 km * 0.6 km on ground - over the atmosphere during the integration time. The motion is a combined motion of the scan mirror and the orbital motion of the spacecraft. Since the integration time is diverse, and the angular speed for forward and flyback is different by a factor 4 the ground pixel size varies between approx. 92 km* 117 km (along track* across track) and approx. 32 km* 30 km.	

State ID 10 nad10	Scientific measurement	Nadir
ILOS	Description	
	see state ID 09	
Scan	see state ID 09; speed 2° /s	
Swath	see state ID 09; width 117 km	

Measurement duration	The duration of the measurement is set to 80 s, which results in 16 forward and flyback scans. A stretch of 4.77° of the orbit is passed during this time.
Exposure control	see state ID 09 The exposure parameters for nad10 are set to produce optimal signals for the orbital position -3° to 5° and 175° to 183°. The definitions are summarised in PET table N2.
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad10 low rate data they are listed in integration_time table 22.
Pixel size (Ground pixel)	see state ID 09 The ground pixel size varies between approx. 92 km* 117 km (along track* across track) and approx. 32 km* 30 km.

State ID 11 nad11	Scientific measurement	Nadir
ILOS	Description see state ID 09	
Scan	see state ID 09; speed 2° /s	
Swath	see state ID 09; width 117 km see state ID 09; width 117 km	
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 forward and flyback scans. A stretch of 4.77° of the orbit is passed during this time.	
Exposure control	see state ID 09 The exposure parameters for nad11 are set to produce optimal signals for the orbital position 5° to 16° and 164° to 175°. The definitions are summarised in PET table N3.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad11 low rate data they are listed in integration_time table 23.	
Pixel size (Ground pixel)	see state ID 09 The ground pixel size varies between approx. 59 km* 117 km (along track* across track) and approx. 27 km* 7.5 km.	

State ID 12 nad12	Scientific measurement	Nadir
ILOS	Description see state ID 09	
Scan	see state ID 09; speed 2° /s	
Swath	see state ID 09; width 117 km	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 09 The exposure parameters for nad12 are set to produce optimal signals for the orbital position 16° to 26° and 154° to 164°. The definitions are summarised in PET table N4.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad12 low rate data they are listed in integration_time table 24.	
Pixel size (Ground pixel)	see state ID 09 The ground pixel size varies between approx. 32 km* 30 km (along track* across track) and approx. 26 km* 3.75 km.	

State ID 13 nad13	Scientific measurement	Nadir
----------------------	------------------------	-------

ILOS	Description see state ID 09
Scan	see state ID 09; speed 2° /s
Swath	see state ID 09; width 117 km
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.
Exposure control	see state ID 09 The exposure parameters for nad13 are set to produce optimal signals for the orbital position 26° to 36° and 144° to 154° . The definitions are summarised in PET table N5.
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad13 low rate data they are listed in integration_time table 25.
Pixel size (Ground pixel)	see state ID 09 The ground pixel size varies between approx. 32 km* 30 km (along track* across track) and approx. 26 km* 3.75 km.

State ID 14 nad14	Scientific measurement	Nadir
ILOS	Description see state ID 09	
Scan	see state ID 09; speed 2° /s	
Swath	see state ID 09; width 117 km	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 09. The exposure parameters for nad14 are set to produce optimal signals for the orbital position 36° to 70° and 110° to 144° . The definitions are summarised in PET table N6.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad14 low rate data they are listed in integration_time table 26.	
Pixel size (Ground pixel)	see state ID 09 The ground pixel size varies between approx. 32 km* 30 km (along track* across track) and approx. 27 km* 7.5 km.	

State ID 15 nad15	Scientific measurement	Nadir
ILOS	Description see state ID 09	
Scan	see state ID 09; speed 2° /s	
Swath	see state ID 09; width 117 km	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 forward and flyback scans. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 09. The exposure parameters for nad15 are set to produce optimal signals for the orbital position 70° to 110° . The definitions are summarised in PET table N7.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad15 low rate data they are listed in integration_time table 27.	
Pixel size (Ground pixel)	see state ID 09 The ground pixel size varies between approx. 59 km* 117 km (along track* across track) and approx. 27 km* 7.5 km.	

State ID 16 lwnd02	Monitoring	NDF_Monitoring, ND Filter OUT
ILOS	Description	
	<p>For the purpose of monitoring the ND filter, the WLS is observed via the ESM under a 'non-optimal' angle of 10.673° with the ND filter being 'OUT'.</p> <p>In phase1 the position of the ESM is acquired and in measurement phase 2 the ESM points to the WLS under this angle (basic scan profile 13).</p>	
Scan	no scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 12 s.	
Exposure control	The exposure parameters for lwnd02 are summarised in PET table NDF_Monitoring. Note that channel 6 uses the Hot Mode (see Hot Mode table) with a PET of 14.4 ms.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For lwnd02 low rate data they are listed in integration_time table 48. The integration time given for channel 6 is the effective integration time which results from the Hot Mode. Readouts of channel 6 are obtained every 4 sec.	
Pixel size	n.a.	

State ID 17 ascd01	Calibration	Sun_ASM_Diffuser_Calibration
ILOS	Description	
	<p>In state ID 17 sunlight is reflected onto the entrance slit of the spectrometer via the ASM diffuser which is mounted on the rear side of the ASM mirror. The Sun incidence angle onto the diffuser amounts to between 48.2° -65.5° . This is caused by the apparent motion of the Sun in azimuth (323.2° -326.5° for ascd01) and the required scan of the ASM of 14° during the measurement. The measurement starts when the Sun has reached an elevation of 22.5° , i.e. the angle of 'reflection' into the telescope is 22.5° . The aperture stop is set to 'large' and the ND filter is 'OUT'.</p> <p>In phase 1 the position of the ESM at 11.255° (corresponds to an altitude of 250 km, basic profile 9) and the position of the ASM are calculated (basic profile 4 without azimuth correction and H/W- constellation 1, ASM diffuser normal points towards +9° at the start of the state, i.e. ASM mirror normal = ASM angle amounts to 189°) and acquired. The ESM stays in this position fixed for the duration of the state. In the measurement phase 2 the ASM diffuser executes the scan of 14° thus changing the angle of incidence.</p>	
Scan	A scan of 14° is performed. The scan speed amounts to 0.47° /s.	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 30 s.	
Exposure control	The exposure parameters for ascd01 are summarised in PET table Sun_ASM_diffuser.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For ascd01 high rate data they are listed in integration_time table 17.	
Pixel size	n.a..	

State ID 18 ascd02	Calibration	Sun_ASM_Diffuser_Calibration
ILOS	Description	
	see state ID 17 The state ascd02 is executed when the solar azimuth angle amounts to 326.5° -329.5° .	
Scan	see state ID 17; speed 0.47° /s	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 30 s.	
Exposure control	The exposure parameters for ascd02 are summarised in PET table Sun_ASM_diffuser.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For ascd02 high rate data they are listed in integration_time table 17.	
Pixel size	n.a.	

State ID 19 ascd03	Calibration	Sun_ASM_Diffuser_Calibration
ILOS	Description	
	see state ID 17 The state ascd02 is executed when the solar azimuth angle amounts to 329.5° -332.5° .	
Scan	see state ID 17; speed 0.47° /s	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 30 s.	
Exposure control	The exposure parameters for ascd03 are summarised in PET table Sun_ASM_diffuser.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For ascd03 high rate data they are listed in integration_time table 17.	
Pixel size	n.a..	

State ID 20 ascd04	Calibration	Sun_ASM_Diffuser_Calibration
ILOS	Description	
	see state ID 17 The state ascd04 is executed when the solar azimuth angle amounts to 332.5° -335.5° .	
Scan	see state ID 17; speed 0.47° /s	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 30 s.	
Exposure control	The exposure parameters for ascd04 are summarised in PET table Sun_ASM_diffuser.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For ascd04 high rate data they are listed in integration_time table 17.	
Pixel size	n.a.	

State ID 21 ascd05	Calibration	Sun_ASM_Diffuser_Calibration
ILOS	Description	
	see state ID 17 The state ascd05 is executed when the solar azimuth angle amounts to 335.5° -337.9° .	
Scan	see state ID 17; speed 0.47° /s	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 30 s.	
Exposure control	The exposure parameters for ascd05 are summarised in PET table Sun_ASM_diffuser.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For ascd05 high rate data they are listed in integration_time table 17.	
Pixel size	n.a.	

State ID 22 asad01	Monitoring	Sun_ASM_Diffuser_Atmosphere
ILOS	Description	
	<p>In state asad01 the Sun is observed via the ASM diffuser while it rises through the atmosphere. Thus the atmosphere shall be used as a cut-off filter.</p> <p>For the ASM diffuser position an average angle relative to the Sun (basic profile 10, as for state ID ascd02) is used. During the measurement the ASM diffuser executes a scan of 14.9° as for the states ID 17-21. Since the azimuth angle of the Sun varies over a year (323.2° -337.9°), the incidence angle onto the ASM diffuser changes between 46.2° - 74.9° . The ESM remains fixed throughout the measurement. The aperture stop is set to 'large' and the ND filter is 'OUT'.</p> <p>The measurement starts when the Sun has reached an altitude of 17.2 km.</p> <p>In phase 1 the pointing position of the ESM at an altitude of 17.2 km (corresponds to an ESM angle of -13.41°, basic profile 14) and the position of the ASM are calculated (basic profile 10 without azimuth correction and H/W- constellation 1, ASM diffuser normal points towards +7° at the start of the state, i.e. ASM mirror normal = ASM angle amounts to 187°) and acquired. The ESM stays in this position fixed for the duration of the state. In the measurement phase 2 the ASM diffuser executes the scan of 14° while the Sun is rising.</p>	
Scan	A scan of 14.9° is performed. The scan speed amounts to 0.47° /s.	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 32 s.	
Exposure control	The exposure parameters for asad01 are summarised in PET table Sun_ASM_diffuser.	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For asad01 high rate data they are listed in integration_time table 17.	
Pixel size	n.a.	

State ID 23 nad23	Scientific measurement	Nadir_pointing
----------------------	------------------------	----------------

ILOS	Description
	<p>In state ID 23 the earth atmosphere is observed pointing the line of sight (LOS) towards Nadir. To adjust the ILOS, SCIAMACHY uses for the measurement only the nadir/ elevation scan mirror (ESM).</p> <p>By the orbital motion the atmospheric volume above the subsatellite point along the ground track is observed during the duration of the measurement. No scan motion of the ESM via a relative scan profile is invoked, since all factors are set to zero. The ESM is standing still in the basic position controlled by basic profile 1 yielding a position of -45,5°, corresponding to a slight shift in nadir (-z) for the ILOS.</p> <p>The relative scan profile 2 is used only for the purpose of maintaining scanner control because of the applied Earth model correction throughout the measurement.</p>
Scan	no scan
Swath	No swath is implied due to the stand still of the ESM. Principally the IFOV in dispersion direction of 0.045° (0.6 km) determines the 'swath'.
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 consecutive still sequences. A stretch of 4.77° of the orbit is passed during this time.
Exposure control	The exposure parameters for nad23 are set to produce optimal signals for the orbital position 183°. The definitions are summarised in PET table N1.
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad23 low rate data they are listed in integration_time table 21.
Pixel size (Ground pixel)	The ground pixel size is determined by the motion of the <u>I</u> ntermediate <u>F</u> ield of <u>V</u> iew (IFOV) of the instrument of 1.8°* 0.045° corresponding to approx. 25 km* 0.6 km on ground - over the atmosphere during the integration time. The motion of the IFOV is contrary to the 'scanning' nadir observations only caused by the orbital motion of the spacecraft and its pointing stability. Since the integration time is diverse, the ground pixel size varies between approx. 92 km* 1 km (along track* across track) and approx. 32 km* 0.6 km.

State ID 24 nad24	Scientific measurement	Nadir_pointing
ILOS	Description	
	see state ID 23	
Scan	see state ID 23; no scan	
Swath	see state ID 23; none	
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 consecutive still sequences. A stretch of 4.77° of the orbit is passed during this time.	
Exposure control	<p>see state ID 23</p> <p>The exposure parameters for nad24 are set to produce optimal signals for the orbital position -3° to 5° and 175° to 183°. The definitions are summarised in PET table N2.</p>	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For nad24 low rate data they are listed in integration_time table 22.	
Pixel size (Ground pixel)	<p>see state ID 23</p> <p>The ground pixel size varies between approx. 92 km* 1 km (along track* across track) and approx. 32 km* 0.6 km.</p>	

State ID 25 nad25	Scientific measurement	Nadir_pointing
ILOS	Description	
	see state ID 23	
Scan	see state ID 23; no scan	

Swath	see state ID 23; none
Measurement duration	The duration of the measurement is set to 80 s, which results in 16 consecutive still sequences. A stretch of 4.77° of the orbit is passed during this time.
Exposure control	see state ID 23 The exposure parameters for nad24 are set to produce optimal signals for the orbital position 5° to 16° and 164° to 175°. The definitions are summarised in PET table N3 .
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For nad25 low rate data they are listed in integration_time table 23 .
Pixel size (Ground pixel)	see state ID 23 The ground pixel size varies between approx. 59 km * 1 km (along track * across track) and approx. 27 km * 0.6 km.

State ID 26 dcc04	Calibration	Dark_Current_Calibration
ILOS	Description see state ID 08 ILOS pointing in flight direction to 250 km altitude above horizon.	
Scan	no scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 30 s.	
Exposure control	see state ID 08 The exposure parameters for dcc04 are summarized in PET table Dark_Current_4 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For dcc04 low rate data they are listed in integration_time table 51 .	
Pixel size	n.a.	

State ID 27 elimb01	Scientific measurement	Limb_Mesosphere
ILOS	Description In State 27 the earth mesosphere is observed centring the line of sight (LOS) towards the tangent to the earth horizon in the forward direction of the orbit (horizontal distance ca. 3290 km). Contrary to the other limb states, state ID 27 executes a sequence of measurements starting at high (150 km) and descending to low altitudes (approx. 80 km). To adjust the ILOS, SCIAMACHY uses for the measurement the azimuth mirror (ASM) and the nadir/elevation scan mirror (ESM). No relative profile is applied to the ASM, i.e. no horizontal scan is performed. The basic position of the ASM is controlled by basic profile 2 yielding a position of -45°, corresponding to flight direction (-y) for the ILOS. The ESM moves, with a timing as for the scanning limb observations, the ILOS a defined number of angular step towards -z direction. The basic starting position of the ESM is at 150 km (basic profile 5). The elevation step is controlled by relative profile 1, which adjusts the vertical step of the ESM in elimb01 to 0.0285° corresponding to a height resolution approx. 3 km. 23 elevation steps are programmed, i.e. yielding a stop altitude of approx. 80 km.	
Scan	no scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 40.5 s.	
Exposure control	The exposure parameters for elimb01 are set to produce optimal signals in the eclipse phase of the orbit. The definitions are summarised in PET table L6 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For elimb01 low rate data they are listed in integration_time table 6 .	
Pixel size (‘column’ pixel)	The atmospheric ‘column pixel’ size is determined by the Instantaneous Field of View (IFOV) of the instrument of 1.8° * 0.045° corresponding to approx. 103 km * 2.6 km at the distance of the tangent to the horizon. The orbital motion of the spacecraft during the integration time determines	

	the column depth. Since the ASM stands still during a 'scanning period', the column pixel size has the size of the IFOV of approx. 103 km * 3.6 km (across track * height - incl. cycle step height error) also for different integration times.
--	--

State ID 28 limb01	Scientific measurement	Limb_short
ILOS	<p>Description</p> <p>In State 28 the earth atmosphere is observed centering the line of sight (LOS) towards the tangent to the earth horizon in the forward direction of the orbit (horizontal distance ca. 3290 km). This tangent point shall coincide with the subsatellite point of the corresponding nadir observation at this horizontal distance.</p> <p>To adjust the ILOS, SCIAMACHY uses for the measurement the azimuth mirror (ASM) and the nadir/elevation scan mirror (ESM). Instrument specific correction algorithms are applied to ASM accounting for the yaw steering of ENVISAT and for the Earth rotation during the time elapsed (approx. 450 s) between this measurement and the correlated nadir measurement. The basic position of the ESM, which shall be one elevation step below the horizon, is corrected for the varying horizontal height caused by the earth ellipsoid.</p>	
Scan	<p>The atmospheric volume at the horizon (subsatellite point of the corresponding nadir observation) is observed by directing the IFOV with the ASM. The scan motion of the ASM moves the ILOS in crosstrack direction. The basic position of the ASM is controlled by basic profile 2 yielding a position of -45°, corresponding to flight direction (-y) for the LOS. The motion of the ASM is controlled via relative scan profile 3, which is centered around the -y-direction. This profile produces for 1.5 seconds a relative motion (relative to -45° basic position) of constant angular velocity in positive direction and with the alternating inverted profile the ASM returns to the original angular position. The total angular motion of the ASM is approx. 8.5°, which is approx. 17° for the LOS. To account for the decline of the horizon a further correction is applied during this azimuth scan. Correction 3 maintains a constant distance above the horizon by adjusting the ESM position accordingly. Between the forward and reverse motion of the ASM, the ESM is controlled to move the ILOS a defined angular step towards zenith (+z), thus producing a meandering pattern for the ILOS path. The first measurement position for the ESM is one elevation step below the local earth horizon at point of observation. The elevation step is controlled by relative profile 1, which adjusts the vertical step of the ESM in limb01 to 0.0570° (LOS) corresponding to a height resolution of approx. 3 km30 elevation steps and azimuth scans are programmed reaching to an altitude of about 93 km.</p> <p>After the completion of the scans the ESM is moved by elevation basic profile 9 to an angle of about -11.255° (about 250 km above horizon) and the ASM to -45° (flight direction), which is the direction for the exo-atmospheric dark current measurement</p>	
Swath	To adjust the earth coverage the azimuth swath is set to 960 km by setting the ASM scan speed to 11.2°/s (LOS). This swath is identical to the one of the corresponding nadir observation.	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	The exposure of the focal plane linear detector arrays (channels) is controlled by a subset of parameters setting the exposure times of the channels (6 plus 4 virtual) respectively the defined clusters and the corresponding co-adding factors. The exposure parameters for limb01 are set to produce optimal signals for the orbital position L1 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb01 low rate data they are listed in integration_time table 1 .	
Pixel size ('column' pixel)	The atmospheric 'column pixel' size is determined by the scan motion in one layer (elevation step) of the atmosphere of the Instantaneous Field of View (IFOV) of the instrument of 1.8° * 0.045° during the integration time. The IFOV corresponds to 103 km * 2.6 km at the distance of the tangent to the horizon. The orbital motion of the spacecraft during the integration time determines the column depth. Since the integration time is diverse, the column pixel size varies between approx. 1060 km * 3.6 km (across track * height - incl. cycle step height error) and approx. 230 km * 2.6 km.	

State ID 29 limb02	Scientific measurement	Limb_short
ILOS	Description see state ID 28	
Scan	see state ID 28; ASM: approx. 8.5° (mirror) corresponding to approx. 17° LOS; ESM: 34 steps	
Swath	see state ID 28; width 960 km	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 28. The exposure parameters for limb02 are set to produce optimal signals for the orbital position - 20° to -12°. The definitions are summarised in PET table L2 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb02 low rate data they are listed in integration_time table 2 .	
Pixel size (‘column’ pixel)	see state ID 28 The column pixel size varies between approx. 1060 km * 3.6 km (across track * height - incl. cycle step height error) and approx. 230 km * 2.6 km.	

State ID 30 limb03	Scientific measurement	Limb_short
ILOS	Description see state ID 28	
Scan	see state ID 28; ASM: approx. 8.5° (mirror) = approx. 17° LOS; ESM: 34 steps	
Swath	see state ID 28; width 960 km	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 28. The exposure parameters for limb03 are set to produce optimal signals for the orbital position - 12° to 9° and 146° to 157°. The definitions are summarised in PET table L3 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb03 low rate data they are listed in integration_time table 3 .	
Pixel size (‘column’ pixel)	see state ID 28 The column pixel size varies between approx. 1060 km * 3.6 km (across track * height - incl. cycle step height error) and approx. 230 km * 2.6 km.	

State ID 31 limb04	Scientific measurement	Limb_short
ILOS	Description see state ID 28	
Scan	see state ID 28; ASM: approx. 8.5° (mirror) = approx. 17° LOS; ESM: 34 steps	
Swath	see state ID 28; width 960 km	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 28. The exposure parameters for limb04 are set to produce optimal signals for the orbital position 9° to 20° and 125° to 146°. The definitions are summarised in PET table L4 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb04 low rate data they are listed in integration_time table 4 .	
Pixel size (‘column’ pixel)	see state ID 28 The column pixel size varies between approx. 1060 km * 3.6 km (across track * height - incl. cycle step height error) and approx. 230 km * 2.6 km.	

State ID 32 limb05	Scientific measurement	Limb_short
-----------------------	------------------------	------------

ILOS	Description see state ID 28
Scan	see state ID 28; ASM: approx. 8.5° (mirror) = approx. 17° LOS; ESM: 34 steps
Swath	see state ID 28; width 960 km
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.
Exposure control	see state ID 28. The exposure parameters for limb05 are set to produce optimal signals for the orbital position 20° to 125° . The definitions are summarised in PET table L5.
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb05 low rate data they are listed in integration_time table 5.
Pixel size (‘column’ pixel)	see state ID 28 The column pixel size varies between approx. 1060 km * 3.6 km (across track * height - incl. cycle step height error) and approx. 230 km * 2.6 km.

State ID 33 limb06	Scientific measurement	Limb_short
ILOS	Description see state ID 28	
Scan	see state ID 28; ASM: approx. 8.5° (mirror) = approx. 17° LOS; ESM: 34 steps	
Swath	see state ID 28; width 960 km	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 28. The exposure parameters for limb06 are set to produce optimal signals for the orbital position $> 157^\circ$. The definitions are summarised in PET table L6.	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb06 low rate data they are listed in integration_time table 6.	
Pixel size (‘column’ pixel)	see state ID 28 The column pixel size varies between approx. 1060 km * 3.6 km (across track * height - incl. cycle step height error) and approx. 580 km * 2.6 km.	

State ID 34 limb11	Scientific measurement	Limb_short (No swath)
ILOS	Description see state ID 28	
Scan	see state ID 28 No relative profile is applied to the ASM. The basic position of the ASM is also controlled by basic profile 2 yielding a position of -45° , corresponding to flight direction (-y) for the ILOS. This position is maintained throughout the state, i.e. no horizontal scan is performed.	
Swath	No swath is implemented. The ASM is standing still. The pixel dimension in azimuth is of a similar size (approx. 103 km) as the swath of the corresponding nadir observation (120 km).	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 28 The exposure parameters for limb11 are set to produce optimal signals for the orbital position 9° to 25° and 125° to 146° . The definitions are summarised in PET table L4.	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb11 low rate data they are listed in integration_time table 4.	
Pixel size (‘column’ pixel)	see state ID 28 The atmospheric ‘column pixel’ size is determined by the Instantaneous Field of View (IFOV) of the instrument of $1.8^\circ * 0.045^\circ$ corresponding to approx. 103 km * 2.6 km at the distance of the tangent to the horizon. The orbital motion of the spacecraft during the integration time determines the column depth. Since the ASM stands still during a ‘scanning period’, the column pixel size has the size of the IFOV of approx. 103 km * 3.6 km (across track * height - incl. cycle step	

	height error) also for different integration times.
--	---

State ID 35 limb08	Scientific measurement	Limb_short (No swath)
ILOS	Description see state ID 34	
Scan	see state ID 34; no horizontal scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 34 The exposure parameters for limb08 are set to produce optimal signals for the orbital position < -20°. The definitions are summarised in PET table L1 .	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For limb08 low rate data they are listed in integration_time table 1 .	
Pixel size (‘column’ pixel)	see state ID 34 Since the ASM stands still during a ‘scanning period’, the column pixel size has the size of the IFOV of approx. 103 km * 3.6 km (across track * height - incl. cycle step height error) also for different integration times.	

State ID 36 limb09	Scientific measurement	Limb_short (No swath)
ILOS	Description see state ID 34	
Scan	see state ID 34; no horizontal scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 34 The exposure parameters for limb09 are set to produce optimal signals for the orbital position -20° to -12°. The definitions are summarised in PET table L2 .	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For limb09 low rate data they are listed in integration_time table 2 .	
Pixel size (‘column’ pixel)	see state ID 34 Since the ASM stands still during a ‘scanning period’, the column pixel size has the size of the IFOV of approx. 103 km * 3.6 km (across track * height - incl. cycle step height error) also for different integration times.	

State ID 37 limb10	Scientific measurement	Limb_short (No swath)
ILOS	Description see state ID 34	
Scan	see state ID ID 34; no horizontal scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 34 The exposure parameters for limb10 are set to produce optimal signals for the orbital position -12° to 157°. The definitions are summarised in PET table L3 .	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For limb10 low rate data they are listed in integration_time table 3 .	
Pixel size (‘column’ pixel)	see state ID 34 Since the ASM stands still during a ‘scanning period’, the column pixel size has the size of the	

	IFOV of approx. 103 km * 3.6 km (across track * height - incl. cycle step height error) also for different integration times.
--	---

State ID 38 lnad01	Monitoring	Nadir_pointing_left
ILOS	Description	
	In state ID 38 the earth atmosphere is observed pointing the line of sight (LOS) towards Nadir at the extreme left w.r.t. flight direction (approx. 30.5°). This measurement has the purpose to monitor the angle dependent degradation of the ESM mirror. To adjust the ILOS, SCIAMACHY uses for the measurement only the nadir/ elevation scan mirror (ESM). The extreme left position is obtained by using basic profile 1, yielding a position of -45,5°, and a superimposed relative profile 5 which adds -15.95° to the ESM mirror normal. The motion to reach this offset position lasts 4 sec. Once the extreme left position is acquired, the ESM stays in that configuration for the complete measurement phase.	
	Scan	no scan
	Swath	n.a.
	Measurement duration	The duration of the measurement is 65 s. A stretch of 3.88° of the orbit is passed during this time.
	Exposure control	The exposure parameters for lnad01 are set to produce unsaturated signals throughout the orbit°. The definitions are summarised in PET table N7.
Pixel size (Ground pixel)	Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For lnad01 low rate data they are listed in integration_time table 27.
	The ground pixel size is determined by the motion of the Instantaneous Field of View (IFOV) of the instrument of 1.8° * 0.045° corresponding to approx. 25 km* 0.6 km on ground - over the atmosphere during one integration time. The motion of the IFOV is contrary to the 'scanning' nadir observations only caused by the orbital motion of the spacecraft and its pointing stability. Since the integration time is diverse, the ground pixel size varies between approx. 59 km* 1 km (along track* across track) and approx. 27 km* 0.6 km.	

State ID 39 dcchm	Calibration	Dark_Current_Calibration_Hot_Mode
ILOS	Description	
	In state ID 39 the dark signal is measured for exposure times < 31.25 msec in channels 6-8 for the purpose of correcting WLS measurements. In phase 1 the WLS-position of the ESM (10.523°) is acquired and in measurement phase 2 the ESM points to the WLS (basic scan profile 12).	
	Scan	no scan
	Swath	n.a.
	Measurement duration	The duration of the measurement is 12 s. For the total duration of the measurement phase the WLS is off thus yielding only a dark current signal with state settings identical to those of the WLS state (ID 61).
	Exposure control	The exposure parameters for dcchm are summarised in PET table WLS.
Pixel size	Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For dcchm low rate data they are listed in integration_time table 55.
	n.a.	

State ID 40 limb13	Scientific measurement	Limb_short (No swath)
ILOS	Description	
	see state ID 34	
Scan	see state ID 34; no horizontal scan	

Swath	n.a.
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.
Exposure control	see state ID 34 The exposure parameters for limb13 are set to produce optimal signals for the orbital position > 157° . The definitions are summarised in PET table L6 .
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb13 low rate data they are listed in integration_time table 6 .
Pixel size ('column' pixel)	see state ID 34 Since the ASM stands still during a 'scanning period', the column pixel size has the size of the IFOV of approx. 103 km * 3.6 km (across track * height - incl. cycle step height error) also for different integration times.

State ID 41 limb12	Scientific measurement	Limb (No swath)
ILOS	Description see state ID 34	
Scan	see state ID 34; no horizontal scan	
Swath	n.a.	
Measurement duration	The duration of the measurement is 52.31 s, covering a total of 30 scans and the attached dark current measurement. A stretch of 3.12° of the orbit is passed during this time.	
Exposure control	see state ID 34 The exposure parameters for limb10 are set to produce optimal signals for the orbital position 20° to 125° . The definitions are summarised in PET table L5 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For limb12 low rate data they are listed in integration_time table 5 .	
Pixel size ('column' pixel)	see state ID 34 Since the ASM stands still during a 'scanning period', the column pixel size has the size of the IFOV of approx. 103 km * 3.6 km (across track * height - incl. cycle step height error) also for different integration times.	

State ID 42 nad26	Scientific measurement	Nadir_pointing
ILOS	Description see state ID 23	
Scan	see state ID 23; no scan	
Swath	see state ID 23; none	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 consecutive 'still' sequences. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 23 The exposure parameters for nad26 are set to produce optimal signals for the orbital position 16° to 26° and 154° to 164°. The definitions are summarised in PET table N4 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For nad26 low rate data they are listed in integration_time table 24 .	
Pixel size (Ground pixel)	see state ID 23 The ground pixel size varies between approx. 32 km * 1 km (along track * across track) and approx. 26 km * 0.6 km.	

State ID 43 nad27	Scientific measurement	Nadir_pointing
ILOS	Description see state ID 23	
Scan	see state ID 23; no scan	

Swath	see state ID 23; none
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 consecutive 'still' sequences. A stretch of 3.88° of the orbit is passed during this time.
Exposure control	see state ID 23 The exposure parameters for nad27 are set to produce optimal signals for the orbital position 26° to 36° and 144° to 154°. The definitions are summarised in PET table N5 .
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For nad27 low rate data they are listed in integration_time table 25 .
Pixel size (Ground pixel)	see state ID 23 The ground pixel size varies between approx. 32 km * 1 km (along track * across track) and approx. 26 km * 0.6 km.

State ID 44 nad28	Scientific measurement	Nadir_pointing
ILOS	Description see state ID 23	
Scan	see state ID 23; no scan	
Swath	see state ID 23; none	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 consecutive 'still' sequences. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 23 The exposure parameters for nad28 are set to produce optimal signals for the orbital position 36° to 70° and 110° to 144°. The definitions are summarised in PET table N6 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For nad28 low rate data they are listed in integration_time table 26 .	
Pixel size (Ground pixel)	see state ID 23 The ground pixel size varies between approx. 32 km * 1 km (along track * across track) and approx. 27 km * 0.6 km.	

State ID 45 nad29	Scientific measurement	Nadir_pointing
ILOS	Description see state ID 23	
Scan	see state ID 23; no scan	
Swath	see state ID 23; none	
Measurement duration	The duration of the measurement is set to 65 s, which results in 13 consecutive 'still' sequences. A stretch of 3.88° of the orbit is passed during this time.	
Exposure control	see state ID 23 The exposure parameters for nad29 are set to produce optimal signals for the orbital position 70° to 110°. The definitions are summarised in PET table N7 .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For nad29 low rate data they are listed in integration_time table 27 .	
Pixel size (Ground pixel)	see state ID 23 The ground pixel size varies between approx. 59 km * 1 km (along track * across track) and approx. 27 km * 0.6 km.	

State ID 46 dcc01	Calibration	Dark_Current_Calibration
ILOS	Description see state ID 08 ILOS pointing in flight direction to 250 km altitude above horizon.	
Scan	no scan	
Swath	n.a.	

Measurement duration	The duration of the measurement is set to 10 s.
Exposure control	The exposure parameters for dcc01 are summarized in PET table Dark_Current_1 .
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For dcc01 low rate data they are listed in integration_time table 45 .
Pixel size	n.a.

State ID 47 sos02	Scientific measurement Calibration	SO&C_Scanning/ Pointing
ILOS	<p>Description</p> <p>In state ID 47 the ILOS is directed towards the Sun during sunrise resp. the Sun whilst ascending. To adjust the ILOS, SCIAMACHY uses for the measurement the nadir/elevation scan mirror (ESM) and the azimuth scan mirror (ASM). In the start phase the position of the ASM is calculated based on the position of the Sun defined in the <i>START TIMELINE MCMD</i> (correction 8 of basic scan profile 3 and relative profile 5). The position of the ESM is calculated (pointing to an altitude 17.2 km above the calculated point of sunrise). Both mirrors acquire their calculated position. In phase 2 ASM tracks the propagated Sun position, whereas ESM starts to scan $\pm 0.33^\circ$ around 17.2 km. This phase is determined to balance the effects of the atmospheric refraction on shape and motion of the Sun. At the end of this phase the centre of the Sun should coarsely coincide with the ILOS. In Phase 3 the Sun follower (SFS) takes over, acquires and tracks the Sun with the ASM, the ESM continues scanning while now following the rising target with the predicted velocity. In phase 4 the ESM maintains this scan motion. The ASM points to the Sun (correction 6). In phase 5 the Sun has passed the upper edge of the atmosphere. The ESM has stopped scanning and acquires also the Sun (correction 4 of basic profile 3 and relative profile 5). In the final phase (6) both mirrors track the Sun (correction 6 resp. correction 4).</p>	
Scan	A scan of $\pm 0.33^\circ$ of the ILOS in elevation direction is implemented during phases 2-4, when ILOS is centered to 17.2 km or following the rising Sun. After completion of one scan the scanning direction is inverted for the subsequent scan. Scan duration is 2s each direction. Totally 16 scans are performed in phase 2, 2 scans in phase 3 and 14 in phase 4.	
Swath	n.a.	
Measurement duration	The initial phase of pointing to an altitude of 17.2 km above the location of sunrise has a duration of 32 s. The sun acquisition and pointing phase takes 4 s and the consecutive tracking/ scanning of the sun another 28 s. State ID 47 is concluded with a measurement of 2 s pointing to the Sun above the atmosphere. Total duration of sos02 is 66 s.	
Exposure control	The irradiation of the focal plane by the Sun is reduced by two mechanisms: An aperture stop (primitive cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for sos02 are summarised in PET table Sun .	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For sos02 high rate data they are listed in integration_time table 32 . A resolution of approx. 0.02° corresponding to 1.2 km at horizontal distance resp. 0.165° (10 km) is achieved.	
Pixel size	n.a.	

State ID 48 lwnd01	Monitoring	NDF_Monitoring, ND Filter IN
ILOS	<p>Description</p> <p>For the purpose of monitoring the ND filter, the WLS is observed via the ESM under a 'non-optimal' angle of 10.673° with the ND filter being 'IN'. In phase 1 the position of the ESM is acquired and in measurement phase 2 the ESM points to the WLS under this angle (basic scan profile 13).</p>	
Scan	no scan	

Swath	n.a.
Measurement duration	The duration of the measurement is set to 12 s.
Exposure control	The exposure parameters for lwnd01 are summarised in PET table NDF_Monitoring . Note that channel 6 uses the Hot Mode (see Hot Mode table) with a PET of 14.4 ms.
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For lwnd01 low rate data they are listed in integration_time table 48 . The integration time given for channel 6 is the effective integration time which results from the Hot Mode. Readouts of channel 6 are obtained every 4 sec.
Pixel size	n.a.

State ID 49 sos01	Scientific measurement Calibration	SO&C_Scanning_Long_Duration
ILOS	Description see state ID 47. In state ID 49 the ILOS is controlled in the first 3 phases with the same strategy as in ID 47. Phase 4 has the same features as in ID 47 with ASM tracking the Sun and ESM following the track of the Sun with ESM basic profile 3 corrected with correction 8 whilst it scans. This phase continues above the atmosphere until the Sun has nearly reached the upper edge of the FOV of the limb baffle.	
	Scan A scan of $\pm 0.33^\circ$ of the ILOS in elevation direction is implemented during phases 1-4, when ILOS is centred to 17.2 km or following the rising Sun. After completion of a scan the scanning direction is inverted for the subsequent scan. Scan duration is 2s each direction. Totally 16 scans are performed in phase 2, 2 scans in phase 3 and 47 in phase 4.	
Swath	n.a.	
Measurement duration	The initial phase of pointing to an altitude of 17.2 km above the location of sunrise has a duration of 32 s. The Sun acquisition and pointing phase takes 4 s and the consecutive tracking/scanning of the sun another 94 s. Total duration of sos01 is 130 s.	
Exposure control	The irradiation of the focal plane by the Sun is reduced by two mechanisms: An aperture stop (prim.cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (prim.cmd <i>ND FILTER IN</i>). The exposure parameters for sos01 are summarised in PET table Sun .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For sos02 high rate data they are listed in integration_time table 32 . A resolution of approx. 0.02° corresponding to 1.2 km at horizontal distance resp. 0.165° (10 km) is achieved.	
Pixel size	n.a.	

State ID 50 scs01	Calibration	SO&C_Scanning (fast_sweep)
ILOS	Description In state ID 50 the Sun is used as a calibration source i.e. the solar position shall be well above the atmosphere. ASM and ESM are used to control the ILOS. Both mirrors shall follow the Sun track by means of basic profile 3. Since this profile is constructed to cover sunrise around an altitude of 17.2 km (see ID 47) it must be corrected for higher Sun elevation. Correction 8 uses the angular parameters of the Sun as they are contained in the MCMD <i>START TIMELINE</i> to calculate the correction terms for the two mirrors. These parameters are valid for the start of the measurement phase. Updates are performed with each relative profile. In phase 1 the positions for both mirrors are calculated (correction 8) and acquired. In phase 2 both mirrors are following the corrected, propagated Sun trajectory and the ESM is in addition performing a scan (fast_sweep - relative profile 6) over the Sun.	
	Scan When the centre of the ILOS is following the rising Sun, scans over the Sun in elevation direction of approx. 2.72° (LOS) are performed. They are controlled by relative profile 6 (fast sweep), which produces a scan of 0.125 s duration in one direction and then holds this position for another	

	0.125 s. The scan speed (LOS) is 21.7°/s in the not accelerated segments of profile 6. The direction of the scan is inverted after each scan. In total 12 scans over the Sun of the type fast_sweep are performed during the measurement phase 2.
Swath	n.a.
Measurement duration	Total duration of scs01 is 3 s.
Exposure control	The irradiation of the focal plane by the Sun is reduced by two mechanisms: An aperture stop (prim.cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (prim.cmd <i>ND FILTER IN</i>). The exposure parameters for scs01 are summarised in PET table Sun_Fast_Sweep . They are all set to 0.125 s.
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For scs01 high rate data they are listed in integration_time table 36 .
Pixel size	n.a.

State ID 51 sop01	Scientific measurement Calibration	SO&C_Pointing
	Description	
ILOS	<p>In state ID 51 the ILOS is directed towards the Sun during sunrise resp. the Sun whilst ascending. To adjust the ILOS, SCIAMACHY uses for the measurement the nadir/elevation scan mirror (ESM) and the azimuth scan mirror (ASM). State ID 51 follows a similar strategy in the lower atmosphere as ID 47 and ID 49.</p> <p>Phase 1 - start phase - with calculation/acquisition of sunrise position for ASM and 17.2 km height for ESM, phase 2 - ESM scanning at 17.2 km and ASM following Sun track- and phase 3 - Sun acquisition by ASM via SFS and ESM scanning - are identical to ID 47/49. In phase 4 ASM is sun pointing via SFS and ESM has stopped scanning and acquires the sun (correction 4). In Phase 5 ESM is now also pointing to the Sun (correction 6) as the ASM and both mirrors track the Sun centre till above the atmosphere.</p>	
Scan	A scan of $\pm 0.33^\circ$ of the ILOS in elevation direction is implemented during phases 2 and 3, when the ILOS is centred to 17.2 km scanning the rising Sun. Scan duration is 2s. After completion of a scan the scanning direction is inverted for the subsequent scan. Totally 24 scans over the Sun are performed during the phases 2 and 3.	
Swath	n.a.	
Measurement duration	The initial phase of pointing to an altitude of 17.2 km above the location of sunrise has a duration of 36 s. The Sun acquisition and pointing phase - only via ASM - takes 12 s and the consecutive tracking/ pointing to the Sun - now also ESM control via SFS - another 16 s. The final phase 5 - pointing to the Sun - provides several seconds of measurement time above the atmosphere. Total duration of sop01 is 64 s.	
Exposure control	The irradiation of the focal plane by the Sun is reduced by two mechanisms: An aperture stop (prim.cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (prim.cmd <i>ND FILTER IN</i>). The exposure parameters for sop01 are summarised in PET table Sun .	
Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For sop01 high rate data they are listed in integration_time table 32 .	
Pixel size	n.a.	

State ID 52 escd01	Calibration	Sun_ESM_Diffuser_Calibration ND-Filter OUT
	Description	
ILOS		

	<p>In state ID 52 no image of the Sun is projected onto the entrance slit of the spectrometer. For calibration purposes the ESM diffuser is reflecting the sunlight into the telescope. This diffuser is a layer deposited on the rear side of the ESM. The angle between the SCIAMACHY optical axis and the diffuser normal shall amount to 15° to prevent vignetting from the scanner housing while the incident solar light has an angle of 'reflection' of 22.5° into the telescope.</p> <p>In phase 1 the position of the ESM at 165° (backside of ESM under 15° inclination) and the position of the ASM are calculated (basic profile 6 with azimuth correction 8 and H/W-constellation 4) and acquired. The ESM stays in this position fixed for the duration of the state. In the measurement phase 2 ASM follows the motion of the Sun with the corrected rate from the <i>START TIMELINE MCMD</i>.</p> <p>The timing of the state has to be planned in such a way, that the ascending Sun meets the requirement of 22.5° incidence angle at the start of the measurement phase.</p>
Scan	no scan
Swath	n.a.
Measurement duration	The measurement phase has a duration of 30s.
Exposure control	escd01 is performed without additional reduction of the sunlight. The ND-filter is not used in escd 01 (primitive cmd <i>ND FILTER OUT</i>). The exposure parameters for escd01 are summarised in PET table Sun ESM diffuser .
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For escd01 high rate data they are listed in integration_time table 40 .
Pixel size	n.a.

State ID 53 sscp02	Calibration	Sub_Solar_Calibration_Pointing
ILOS	<p>Description</p> <p>In state ID 53 the Sun is observed at high elevation through the sub_solar port (primitive cmd <i>NADIR CAL WINDOW OPEN</i>). In this configuration only the ESM can be used, therefore no capability exists to adjust the LOS in azimuth direction towards the Sun. To provide the required angular configuration the <i>START TIMELINE MCMD</i> for this state must be timed to fulfill the fixed angular correlation of the Sun position as related to the fixed IFOV in azimuth of SCIAMACHY in the sub_solar_window, which has a FOV of 1.72° (azimuth)* 14.78° (elevation) In azimuth the IFOV is further reduced by the small aperture used with solar observations (0.72°). The centerline of the aperture coincides with the centerline of the sub_solar_window.</p> <p>In phase 1 the position of the ESM is calculated and acquired within the sub_solar_window applying correction 8 to basic profile 4 (sub_solar) for the actual position of the Sun contained in <i>START TIMELINE MCMD</i>. In phase 2 the ESM waits in this position for the Sun to come fully into the aperture. In phase 3 the ESM acquires the Sun with the SFS (correction 4) centering the slit (0.045°) on the Sun, during phase 4 the solar disk continues moving in azimuth direction through the aperture caused by the orbital motion. The ESM follows the solar track with correction 9, where the calculated Sun position is propagated with corrections derived from the SFS, whilst the Sun moves out of the aperture.</p>	
Scan	no scan	
Swath	n.a.	
Measurement duration	The initial phase of pointing to the partially obscured sun has a duration of 7 s. The Sun acquisition phase take 6 s and the consecutive tracking/pointing to the vanishing sun another 9 s. Total duration of sscp02 is 22 s.	
Exposure control	The irradiation of the focal plane detectors (channels) by the Sun is reduced by two mechanisms: an aperture stop (primitive cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for sscp02 are summarised in PET table Sun .	
Integration time	The individual integration times are set by the exposure control (exposure time * co-adding factor). For sscp02 low rate data they are listed in integration_time table 31 .	
Pixel size	n.a.	

State ID 54 mos01	Calibration	Moon_Scanning
ILOS	Description	
	In state ID 54 the moon is used as a calibration source i.e. the lunar position shall be well above the atmosphere. ASM and ESM are used to control the ILOS. Both mirrors shall follow the track of the moon.	
	In phase 1 the predicted moon position and the resulting angular positions of both mirrors are calculated and the positions acquired. Correction 5 uses the angular data of the moon as they are contained in the MCMD <i>START TIMELINE</i> to calculate the correction terms for the two mirrors. These terms are valid for the start of phase 2. Updates are performed with each relative profile. In phase 2 both mirrors are acquiring the centre of the moon using the SFS with <i>APERTURE STOP LARGE</i> (phase type 1 and correction 5 - readout B). In phase 3 the ASM follows the moon in pointing mode stirred by the SFS loop and the ESM follows the track of the moon using the updated correction terms derived from correction 9 (improved tracking using AOCS), whilst it performs nominal scans over the moon.	
	Scan	
	A scan of $\pm 0.33^\circ$ of the ILOS in elevation direction is implemented during phase 3, when ILOS is centred to the moon and following his track. Scan duration is 2 s each direction. The scan direction is inverted after each scan. 5 nominal scans over the moon are performed.	
Swath	n.a.	
Measurement duration	The acquisition/pointing phase 2 of mos01 takes 2 s. The scanning phase 3 takes 10 s. Total duration of mos01 is 12 s.	
Exposure control	The exposure parameters for mos01 are summarised in PET table Moon .	
Integration time	For mos01 low rate data they are listed in integration_time table 47 .	
Pixel size	n.a.	

State ID 55 mop03	Scientific measurement Calibration	MO&C_Pointing_Troposphere
ILOS	Description	
	In state ID 55 the moon is used to measure the atmosphere in occultation. Contrary to ID 56 - MO&C_Pointing - the measurement starts, when the moon crosses the height of about 5 km above the horizon. This requires exact tuning of the start of the timeline, since in pointing mode the dimensions of the spectrometer slit determine the observed area.	
	In phase 1 the predicted moon position and the resulting angular position of ASM and ESM are calculated (correction 5 of basic profile 3 resp. 14) and acquired. The timeline including mop03 starts sufficiently in time to allow the SFS to acquire the moon already well within the troposphere at an altitude of about 5 km. In phase 2 both mirrors are acquiring the centre of the moon using the SFS (correction 5 - readout B). With successful acquisition, the ILOS in phase 3 follows the moon in pointing mode for 14 s. At the end of this phase the moon has reached an altitude of 17.2 km. In phase 4 the pointing to the lunar center continues up to an altitude close to the upper edge of the TCFOV of the limb baffle. In case acquisition was not successful in the lower atmosphere, the moon is supposed to be tracked from an altitude of 17.2 km (phase 4).	
	Note: the exeution of this state during SODAP proved, that this measurement scheme is not feasible due to the atmospheric observation conditions at low altitudes. The execution of this state is presently suspended.	
	Scan	
Scan	no scan	
Swath	n.a.	
Measurement duration	The acquisition/pointing phase 2 of mop03 takes 2 s. The pointing phase (phase 3) in the troposphere and lower stratosphere takes 14s and measurements above 17.2 km last for 126 s. Total duration is 142 s.	
Exposure control	The exposure parameters for mems01 are summarised in PET table Moon .	
Integration time	For mop03 low rate data they are listed in integration_time table 47 .	

Pixel size	n.a.

State ID 56 mop01	Scientific measurement Calibration	MO&C_Pointing
ILOS	Description	
	<p>In state ID 56 the moon is used to measure the atmosphere in occultation. Contrary to ID 51 - SO&C_Pointing - the measurement starts, when the moon crosses the height of 17.2 km above the horizon. This requires exact tuning of the start of the timeline, since in pointing mode the dimensions of the spectrometer slit determine the observed area. In phase 1 the predicted moon position and the resulting angular position of ASM and ESM are calculated (correction 8 of basic profile 3 resp. 14) and acquired. The moon should have a height of 17.2 km above the horizon. In phase 2 both mirrors are tracking the centre of the moon using AOCs information. In phase 3 the ASM and ESM acquire the moon with the SFS (correction 5 - readout B). This occurs at an altitude of about 70 km. Phase 4 follows the moon up to the top of the atmosphere, now with both the pointing ASM and the ESM being controlled via the SFS (correction 7).</p>	
Scan	no scan	
Swath	n.a.	
Measurement duration	The duration of the initial pointing phase (phase 2) without SFS control amounts to 16 s. The acquisition/pointing phase 3 of mop01 takes 2 s. The tracking phase 4 takes 22 s. Total duration of mop01 is 40 s.	
Exposure control	The exposure parameters for mop01 are summarised in PET table Moon .	
Integration time	For mop01 low rate data they are listed in integration_time table 47 .	
Pixel size	n.a.	

State ID 57 mop02	Scientific measurement Calibration	Moon_Pointing_Long-Duration
ILOS	Description	
	<p>In state ID 57 the moon is used to measure the atmosphere in occultation and to get, in addition, calibration measurements above the atmosphere. The strategy is a copy of state ID 56 but the moon pointing phase 4 is extended until the moon nearly reaches the upper edge of the TCFOV of the limb baffle.</p>	
Scan	no scan	
Swath	n.a.	
Measurement duration	The duration of the initial pointing phase (phase 2) without SFS control amounts to 16 s. The acquisition/pointing phase 3 of mop01 takes 2 s. The tracking phase 4 takes 110 s. Total duration of mop02 is 128 s.	
Exposure control	The exposure parameters for mop02 are summarised in PET table Moon .	
Integration time	For mop02 low rate data they are listed in integration_time table 47 .	
Pixel size	n.a.	

State ID 58 sscp01	Calibration	Sub_Solar_Calibration_Pointing/ Scanning
ILOS	Description	

	<p>In state ID 58 the Sun is observed at high elevation similar to state ID 53.</p> <p>In phase 1 the position of the ESM in the sub_solar_window is calculated with basic profile 4 applying correction 8 for the actual position of the Sun contained in <i>START TIMELINE MCMD</i> and acquired. In phase 2 the ESM follows the propagated track of the Sun waiting for her to come fully into the aperture due to the orbital motion. In phase 3 the ESM acquires the Sun with the SFS (correction 4) centring the slit (0.045°) on the Sun and during this phase the solar disk moves in azimuth direction through the aperture caused by the orbital motion while being tracked by the ESM via SFS. In phase 4 the ESM performs 2 nominal scans over the Sun (relative profile 4) while the centre of the scan is maintained on the middle of the Sun using correction 9, where the calculated Sun position is propagated with the corrections derived from the SFS. In phase 5 the Sun moves out of the aperture being tracked with the now standing still ESM (correction 9).</p>
Scan	A scan of $\pm 0.33^\circ$ of the ILOS in elevation direction centred on the Sun is implemented during phase 4. Scan duration is 2 s. Two nominal scans are performed.
Swath	n.a.
Measurement duration	The initial phase of pointing to the partially obscured sun has a duration of 7 s. The Sun acquisition and pointing phase takes 2 s, the scan phase 5 takes 4 s and the consecutive tracking/pointing to the vanishing Sun another 9 s. Total duration of sscp01 is 22 s.
Exposure control	The irradiation of the focal plane detectors (channels) by the Sun is reduced by two mechanisms: An aperture stop (primitive cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for sscp01 are summarised in PET table Sun .
Integration time	The individual integration times are set by the exposure control (exposure time * coadding factor). For sscp01 low rate data they are listed in integration_time table 31 .
Pixel size	n.a.

State ID 59 lsc01	Calibration	Spectral_Lamp_Calibration
ILOS	<p>Description</p> <p>In state ID 59 SCIAMACHY's spectral lamp is used as a spectral line source for wavelength calibration. The ESM is used to project the spectral light into the telescope.</p> <p>In phase 1 the SLS position of the ESM (9.768°) is acquired and in measurement phase 2 the ESM points to the SLS (basic scan profile 10).</p> <p>In this state a longer duration for cooldown is required.</p>	
Scan	no scan	
Swath	n.a.	
Measurement duration	Measurement duration of lsc01 is 12 s.	
Exposure control	The exposure parameters for lsc01 are summarised in PET table SLS .	
Integration time	The individual integration times are set by the exposure control (exposure time * coadding factor). For lsc01 low rate data they are listed in integration_time table 53 .	
Pixel size	n.a.	

State ID 60 sscs01	Calibration	Sub_Solar_Calibration_Scanning (fast_sweep)
ILOS	<p>Description</p> <p>In state ID 60 the Sun is observed at high elevation similar to state ID 53.</p> <p>In phase 1 the ESM is positioned with basic profile 4 in the sub_solar_window applying correction 8 for the actual position of the Sun contained in <i>START TIMELINE MCMD</i>. In phase 2 the basic position of the ESM follows the propagated track of the Sun centre (correction 8) and performs additionally fast_sweeps over the Sun, which moves through the aperture in azimuth direction caused by the orbital motion.</p>	
Scan	When the centre of the ILOS is following in elevation direction the Sun, scans over the Sun in elevation direction of ca. 2.72° are performed. They are controlled by relative profile 6 (fast_sweep), which produces a scan of 0.125 s duration in one direction and then holds this	

	proition for amother 0.125s. The scan speed (LOS) is 21.7°/s in the not accelerated segments of profile 6. The direction of the scan is inverted after each scan. Totally 88 scans over the Sun of the type fast_sweep are performed during the measurement phase.
Swath	n.a.
Measurement duration	The measurement phase (scanning fast_sweep of the part time obscured Sun) has a duration of 22 s.
Exposure control	The irradiation of the focal plane detectors (channels) by the sun is reduced by two mechanisms: An aperture stop (primitive cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for sscs01 are summarised in PET table Sun_Fast_Sweep . The effective exposure of all pixels to the Sun is 31.25 msec, since due to the fast_sweep motion of the ILOS the IFOV scans over the complete Sun within this time.
Integration time	The individual integration times are set by the exposure control (exposure time* coadding factor). For sscs01 low rate data they are listed in integration_time table 35 .
Pixel size	n.a.

State ID 61 lwc01	Calibration	White_Lamp_Calibration
ILOS	Description	
	In state ID 61 SCIAMACHY's white lamp is used as a light source for radiometric calibration. The ESM is used to project the white light into the telescope. In phase 1 the WLS position of the ESM (10.523°) is acquired and in measurement phase 2 the ESM points to the WLS (basic scan profile 12). In this state a longer duration for cooldown is required.	
	Scan	no scan
	Swath	n.a.
Measurement duration	Measurement duration of lwc01 is 12 s.	
Exposure control	The exposure parameters for lwc01 are summarised in PET table WLS .	
Integration time	The individual integration times are set by the exposure control (exposure time* coadding factor). For lwc01 low rate data they are listed in integration_time table 55 .	
Pixel size	n.a.	

State ID 62 escd02	Calibration	Sun_Diffuser_Calibration ND-Filter IN
ILOS	Description	
	see state ID 52 The ESM diffuser position is at 165° (backside of ESM under 15° inclination), the ASM is following the motion of the Sun. The timing of the state has to be planned in such a way, that the ascending Sun meets the requirement of 22.5° incidence angle at the start of the measurement phase. .	
	Scan	no scan
	Swath	n.a.
Measurement duration	The measurement phase has a duration of 30 s.	
Exposure control	escd02 is performed with additional reduction of the sun light compared to ID 52. The ND-filter is used in escd02 (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for escd02 are summarised in PET table Sun_ESM_diffuser .	
Integration time	The individual integration times are set by the exposure control (exposure time* coadding factor). For escd02 high rate data they are listed in integration_time table 40 .

Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For dcc02 low rate data they are listed in integration_time table 49 .	
Pixel size	n.a.	

State ID 64 nmep01	Calibration	Sun_Nadir/Elevation_Mirror Calibration Pointing
ILOS	Description	
	In state ID 64 the Sun is used as calibration source. ID 64 uses the extra_mirror for a second reflection of the ESM (H/W-constellation 5). The correction algorithms used take account of the doubled mirror deflection. Basic profile 8 used for ESM and ASM also accounts for the extra_mirror.	
	In phase 1 the calculation of the predicted Sun position and the resulting angular positions by both mirrors are performed. Correction 4 uses the angular data of the Sun as they are contained in the MCMD <i>START TIMELINE</i> to calculate the correction terms for the twomirrors. These terms are valid for the start of phase 2. The positions are acquired by ASM and ESM. In phase 2 both mirrors are acquiring the centre of the Sun using the SFS (phase type 1 and correction 4 - readout A). In phase 3 the ILOS is following the Sun in pointing mode stirred by the SFS loop.	
Scan	no scan	
Swath	n.a.	
Measurement duration	The pointing phases 2 plus 3 of nmep01 take 4 s.	
Exposure control	The irradiation of the focal plane by the sun is reduced by two mechanisms: An aperture stop (primitive cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for nmep01 are summarised in PET table Sun .	
Integration time	The individual integration times are set by the exposure control (exposure time* coadding factor). For nmep01 high rate data they are listed in integration_time table 32 .	
Pixel size	n.a.	

State ID 65 adc01	Calibration	ADC_Calibration & Scanner Maintenance
ILOS	Description	
	In State ID 65 the Analogue Digital Converter is calibrated. At the same time the maintenance of the scanners is performed, which require one full revolution of each scanner per orbit to ensure full performance. To synchronise source sequence counter measurement data packets are produced. This is no scientific measurement state but a maintenance state, which is executed each orbit in nominal operations conditions.	
	Scanner motions (ASM & ESM) for one full revolution within the state duration are implemented.	
Scan	Scanner motions (ASM & ESM) for one full revolution within the state duration are implemented.	
Swath	n.a.	
Measurement duration	The duration of the measurement is set to 20 s.	
Exposure control	The exposure parameters for adc01 are summarized in PET table ADC_Cal .	

Integration time	The individual integration times are set by the exposure control (exposure time* co-adding factor). For adc01 low rate data they are listed in integration_time table 43 .
Pixel size	n.a.

State ID 66 nmes02	Calibration	Sun_Nadir/Elevation_Mirror Calibration_Scanning
ILOS	Description	
	In state ID 66 the Sun is used as calibration source. It uses the same constellation as ID 64, but scans the Sun via the double reflection from the ESM by means of the extra_mirror. In phase 1 the calculation of the predicted Sun position and the resulting angular positions of both mirrors are performed. Correction 4 uses the angular data of the Sun as they are contained in the MCMD <i>START TIMELINE</i> to calculate the correction terms for the two mirrors. These terms are valid for the start of phase 2. The positions are acquired by the ASM and ESM. In phase 2 both mirrors are acquiring the centre of the Sun using the SFS (phase type 1 and correction 4 - readout A). In phase 3 the ASM is following the Sun in pointing mode stirred by the SFS loop and the ESM performs nominal scans over the Sun following her track using correction 9 (SFS-corrected propagated Sun positions).	
	Scan	
	In phase 3 the nominal_scan of $\pm 0.33^\circ$ of the ILOS in elevation direction centred on the Sun is implemented. Because of the double reflection off the ESM, its angular motion is halved as compared to the standard nominal_scan. Scan duration is 2 s. The scanning direction is inverted for each subsequent scan. In total 5 scans are performed.	
	Swath	
Measurement duration		n.a.
Exposure control		The pointing phase 2 of nmes02 takes 1 s and the scanning phase 3 takes 10 s. Total duration is 11 s.
Integration time		The irradiation of the focal plane by the sun is reduced by two mechanisms: An aperture stop (prim.cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for nmes02 are summarised in PET table Sun .
Pixel size		The individual integration times are set by the exposure control (exposure time* coadding factor). For nmes02 high rate data they are listed in integration_time table 32 .

State ID 67 dcc03	Calibration	Dark-Current_Calibration
ILOS	Description	
	see state ID 08 ILOS pointing in flight direction to 250 km altitude above horizon.	
Scan		no scan
Swath		n.a.
Measurement duration		The duration of the measurement is set to 80 s.
Exposure control		The exposure parameters for dcc03 are summarized in PET table Dark_Current_3 .
Integration time		The individual integration times are set by the exposure control (exposure time* co-adding factor). For dcc03 low rate data they are listed in integration_time table 50 .
Pixel size		n.a.

State ID 68 nmes01	Calibration	Sun_Nadir/Elevation_Mirror Calibration_Scanning (fast_sweep)
ILOS	Description	

	<p>In state ID 68 the Sun is used as calibration source. It uses the same constellation as ID 64 and ID 66, but the scan of the Sun via the extra_mirrors is of the type fast_sweep.</p> <p>In phase 1 the calculation of the predicted Sun position and the resulting angular positions of both mirrors are performed. Correction 8 uses the angular data of the Sun as they are contained in the MCMD <i>START TIMELINE</i> to calculate the correction terms for the two mirrors. These terms are valid for the start of phase 2. The positions are acquired by the ASM and ESM. In phase 2 the ASM follows the propagated track of the Sun. The same does the ESM and performs additionally the fast_sweeps over the solar disk whilst it follows the Sun centre.</p>
Scan	<p>In phase 2 scans of the type fast_sweep over the sun of ca. 2.72° are performed. They are controlled by relative profile 6 (fast_sweep), which produces a scan of 0.125 s duration in one direction and then holds this position for another 0.125s. The scan speed (LOS) is $21.7^\circ/\text{s}$ in the not accelerated segments of profile 6. The direction of the scan is inverted after each scan. Because of the double reflection off the ESM its angular motion of the mirror is halved as compared to the standard fast_sweep. In total 12 scans are performed.</p>
Swath	n.a.
Measurement duration	The scanning phase 2 takes 3 s.
Exposure control	<p>The irradiation of the focal plate by the sun is reduced by two mechanisms: An aperture stop (primitive cmd <i>APERTURE STOP SMALL</i>) reduces the collecting area of the telescope and a neutral density filter reduces the light flux (primitive cmd <i>ND FILTER IN</i>). The exposure parameters for nmes01 are summarised in PET table Sun_Fast_Sweep. The effective exposure of all pixels to the Sun is 31.25 msec, since due to the fast_sweep motion of the ILOS the IFOV scans over the complete Sun within this time.</p>
Integration time	<p>The individual integration times are set by the exposure control (exposure time* coadding factor). For nmes01 high rate data they are listed in integration_time table 36.</p>
Pixel size	n.a.

State ID 69 lsd01	Calibration	Spectral_Lamp_Diffuser_Monitoring
ILOS	Description	
	<p>In state ID 69 SCIAMACHY's spectral lamp is used as a spectral line source to calibrate the spectral characteristics of SCIAMACHY's ESM diffuser. The diffuser is deposited on the backside of the ESM.</p> <p>In phase 1 the position of the ESM (190.2°) is acquired and in measurement phase 2 the ESM diffuser normal points to a direction between SLS and WLS (basic scan profile 11).</p> <p>In this state a longer duration for cooldown is required.</p>	
Scan	no scan	
Swath	n.a.	
Measurement duration	Measurement duration of lsd01 is 80 s.	
Exposure control	The exposure parameters for lsd01 are summarised in PET table SLS_Diffuser .	
Integration time	The individual integration times are set by the exposure control (exposure time* coadding factor). For lsd01 low rate data they are listed in integration_time table 57 .	
Pixel size	n.a.	

State ID 70 lwd01	Calibration	White_Lamp_Diffuser_Monitoring
ILOS	Description	
	<p>In state ID 70 SCIAMACHY's white lamp is used as a light source to calibrate the radiometric characteristics of SCIAMACHY's ESM diffuser. The diffuser is deposited on the backside of the ESM.</p> <p>In phase 1 the position of the ESM (190.2°) is acquired and in measurement phase 2 the ESM diffuser normal points to a direction between SLS and WLS (basic scan profile 11).</p> <p>In this state a longer duration for cooldown is required.</p>	

Scan	no scan
Swath	n.a.
Measurement duration	Measurement duration of lwd01 is 80 s.
Exposure control	The exposure parameters for lwd01 are summarised in PET table WLS_Diffuser .
Integration time	The individual integration times are set by the exposure control (exposure time * coadding factor). For lwd01 low rate data they are listed in integration_time table 59 .
