| Data Provider Documentation Review | | | Validation Summary | Key |
|------------------------------------|--|-----------------------------------|---|--|
| Product Information | Metrology | Product Generation | | Not Assessed |
| Product Details | Radiometric Calibration & Characterisation | Radiometric Calibration Algorithm | Radiometric Validation Method | Not Assessable |
| Availability & Accessibility | Geometric Calibration & Characterisation | Geometric Processing | Radiometric Validation Results Compliance | Basic |
| Product Format, Flags & Metadata | Metrological Traceability Documentation | Retrieval Algorithm | Geometric Validation Method | Good |
| User Documentation | Uncertainty Characterisation | Mission-Specific Processing | Geometric Validation Results Compliance | Excellent |
| | Ancillary Data | | | Ideal |
| | | | |  Not Public |

Outline

- Motivation for a QA Framework for EO Products
- ESA/NASA QA Framework
- Future – Automated Performance Monitoring

Commercial Satellite Sector Growth

Currently there are around 1000 commercial satellites in orbit in the electro-optical, SAR, hyperspectral, AIS/RF, and hybrid domains from the US, China and other nations.

In 2030, it is projected that there will be over 8000, with the most explosive growth in the hyperspectral and hybrid sensor domains.

The need for systematic evaluation of commercial satellite data will only grow.

The Value of QA

Mission success is dependent upon quality assurance. Evidencing data quality adds significantly to the value of datasets.

- Gives potential customers the confidence data is *fit for their purpose*.
- Many aspects of data quality are aimed at facilitating communication to users → required for e.g. to interoperability.
- ...

QA Standards

Developing increasingly comprehensive definition of mission quality:

- Analysis ready data & interoperability – CEOS ARD
- Fiducial reference measurements – CEOS FRM
- Traceability – CLARREO, TRUTHS, Chinese missions
- Uncertainty evaluation e.g. Sentinel-2 Uncertainty Tool – QA4EO

Need identified to define a coordinated, systematic approach to EO QA, to keep up with pace of development, by implementing a QA standard

Assessment Philosophy

- The assessment framework is aimed at verifying claimed mission performance and adheres, where applicable, to community best practices to an extent that is “fit for purpose”.
- Assessment divided into two parts
 - Review of mission quality as evidenced by its documentation
 - Validation analysis performed by mission quality assessor

QA Framework Definition

Coordinated NASA/ESA activity to define such a standard:

- Generic Guidelines developed to define general framework for satellite mission quality analysis. Results of analysis reported in maturity matrices.
- Specific implementations are generated from this framework for separate sensor type requiring different approaches for those specific mission domains
- Drafts of optical and SAR domain guidelines have been prepared and piloted in numerous ESA/NASA assessments

Framework Structure

| Data Provider Documentation Review | | |
|------------------------------------|--|-----------------------------------|
| Product Information | Metrology | Product Generation |
| Product Details | Radiometric Calibration & Characterisation | Radiometric Calibration Algorithm |
| Availability & Accessibility | Geometric Calibration & Characterisation | Geometric Processing |
| Product Format, Flags & Metadata | Metrological Traceability Documentation | Retrieval Algorithm |
| User Documentation | Uncertainty Characterisation | Mission-Specific Processing |
| | Ancillary Data | |

| Validation Summary |
|---|
| Measurement Validation Method |
| Measurement Validation Results Compliance |
| Geometric Validation Method |
| Geometric Validation Results Compliance |

| Key |
|--|
| Not Assessed |
| Not Assessable |
| Basic |
| Good |
| Excellent |
| Ideal |
|  Not Public |

Validation Summary

Summarises validation activity undertaken by assessor

Data Provider Documentation Review

Review of mission quality as evidenced by its documentation

Product Information

Review of descriptive information accompanying products

Metrology

Review of underpinning evidence for observation quality

Product Generation

Review of “fitness for purpose” of product generation

Detailed Validation Matrix – Optical

| Validation Summary | Detailed Validation | | | | |
|---|---------------------|--|---|--|---------------------------------------|
| Radiometric Validation Method | Radiometric | Absolute Calibration Method | Signal to Noise Method | Temporal Stability Method | |
| Radiometric Validation Results Compliance | | Absolute Calibration Results Compliance | Signal to Noise Results Compliance | Temporal Stability Results Compliance | |
| Geometric Validation Method | Geometric | Sensor Spatial Response Method | Absolute Positional Accuracy Method | Band-to-Band Registration Method | Temporal Stability Method |
| Geometric Validation Results Compliance | | Sensor Spatial Response Results Compliance | Absolute Positional Accuracy Results Compliance | Band-to-Band Registration Results Compliance | Temporal Stability Results Compliance |

| Key |
|----------------|
| Not Assessed |
| Not Assessable |
| Basic |
| Good |
| Excellent |
| Ideal |
| 🔒 Not Public |

Provides the expert user more detailed validation information, metrics domain-specific

Validation Areas

Divides been validation activities e.g. radiometric, geometric

Validation Metric

Highlights key metrics in each validation area

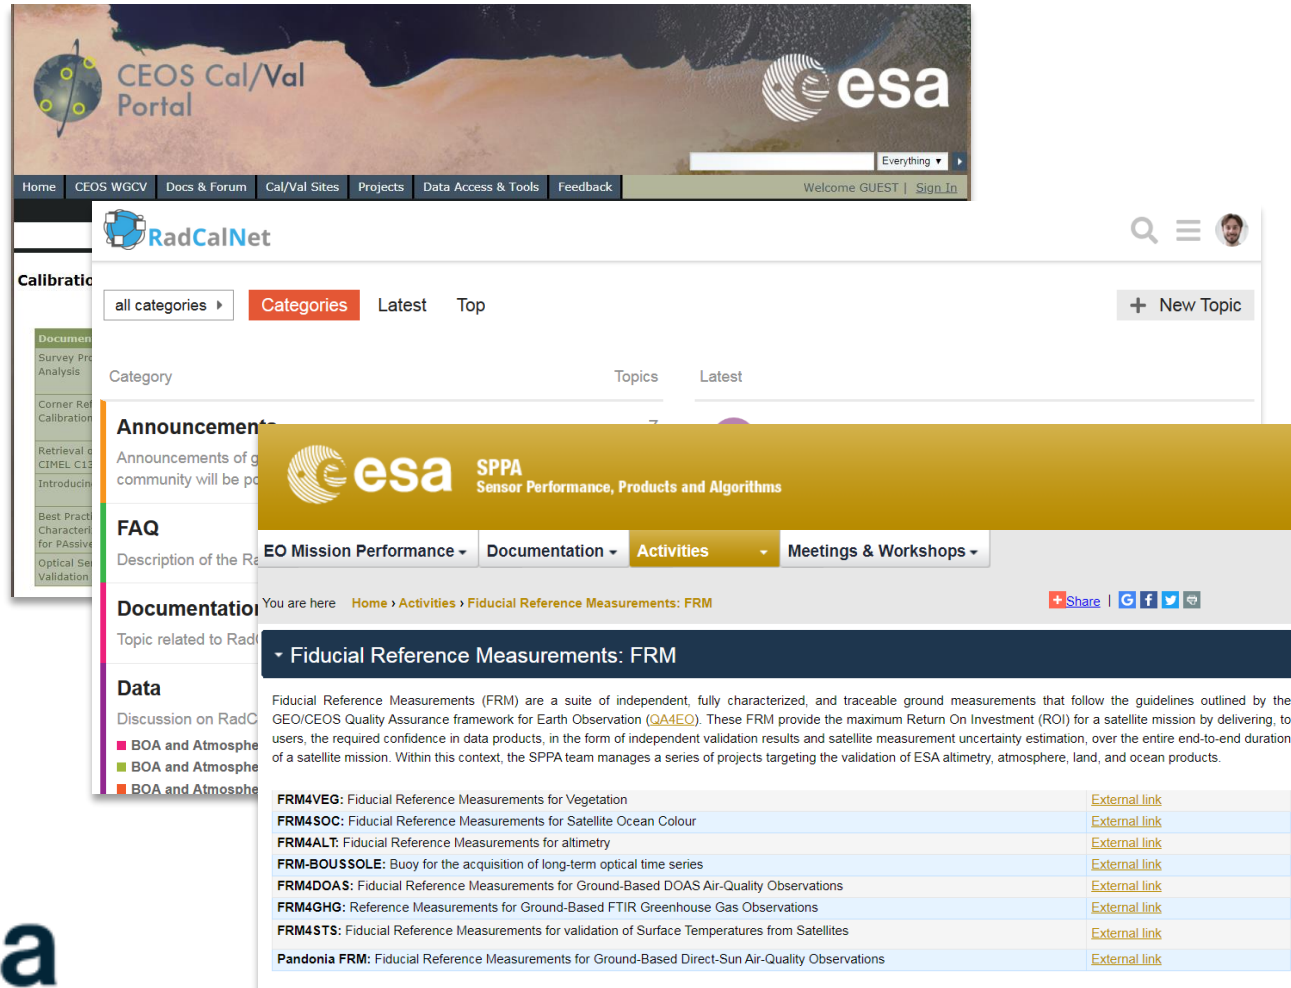

Method

Review of quality of method e.g. reference data quality

Compliance

Comparison of validation result and claimed performance

Example of Best Practice

The image shows a screenshot of the CEOS Cal/Val Portal and the RadCalNet website. The CEOS Cal/Val Portal header includes the logo and navigation links: Home, CEOS WGCV, Docs & Forum, Cal/Val Sites, Projects, Data Access & Tools, Feedback, and a search bar. The RadCalNet page features a navigation menu with categories like EO Mission Performance, Documentation, Activities, and Meetings & Workshops. The main content area displays a section titled "Fiducial Reference Measurements: FRM" with a detailed description and a table of specific FRM types.

| FRM Type | Description | External Link |
|--------------|--|-------------------------------|
| FRM4VEG | Fiducial Reference Measurements for Vegetation | External link |
| FRM4SOC | Fiducial Reference Measurements for Satellite Ocean Colour | External link |
| FRM4ALT | Fiducial Reference Measurements for altimetry | External link |
| FRM-BOUSSOLE | Buoy for the acquisition of long-term optical time series | External link |
| FRM4DOAS | Fiducial Reference Measurements for Ground-Based DOAS Air-Quality Observations | External link |
| FRM4GHG | Reference Measurements for Ground-Based FTIR Greenhouse Gas Observations | External link |
| FRM4STS | Fiducial Reference Measurements for validation of Surface Temperatures from Satellites | External link |
| Pandonia FRM | Fiducial Reference Measurements for Ground-Based Direct-Sun Air-Quality Observations | External link |

Sensor Characterisation and Calibration

Link to good practice material available from a variety of sources:

- CEOS Cal/Val portal, e.g. definition of PICS
- RadCalNet portal
- ESA FRM Projects
- Scientific literature

Approach to Assessments

This framework is something data producers can refer to as they define products and evidence themselves.

Assessment process is an interactive activity between assessors and missions.

Not an academic exercise – provides real value to customers. Space Agencies are justifying their data buys on this!

| Data Provider Documentation Review | | | Validation Summary | Key |
|------------------------------------|--|-----------------------------------|---|----------------|
| Product Information | Metrology | Product Generation | | Not Assessed |
| Product Details | Radiometric Calibration & Characterisation | Radiometric Calibration Algorithm | Measurement Validation Method | Not Assessable |
| Availability & Accessibility | Geometric Calibration & Characterisation | Geometric Processing | | Basic |
| Product Format, Flags & Metadata | Metrological Traceability Documentation | Retrieval Algorithm | Measurement Validation Results Compliance | Good |
| User Documentation | Uncertainty Characterisation | Mission-Specific Processing | | Excellent |
| | Ancillary Data | | Geometric Validation Method | Ideal |
| | | | | 🔒 Not Public |

| Detailed Validation | | | |
|-----------------------------|---|-------------------------------------|---|
| Radiometric | | Geometric | |
| Absolute Calibration Method | Absolute Calibration Results Compliance | Sensor Spatial Response Method | Sensor Spatial Response Results Compliance |
| Signal to Noise Method | Signal to Noise Results Compliance | Absolute Positional Accuracy Method | Absolute Positional Accuracy Results Compliance |
| Temporal Stability Method | Temporal Stability Results Compliance | Band-to-Band Registration Method | Band-to-Band Registration Results Compliance |
| | | Temporal Stability Method | Temporal Stability Results Compliance |

Summary

- Comprehensive standard for mission quality defined by ESA & NASA.
- Generic Assessment Framework implemented in detailed domain-specific guidelines. So far there is a draft of optical and SAR guidelines.
- Has been piloted in numerous ESA/NASA commercial mission QA evaluations.
