

# Integrated Maritime and Territorial Spatial Planning for the Baltic Sea (BalticAIMS)

Samppa Koponen, Jenni Attila, Hanna Alasalmi, Mikko Kervinen, Vesa Keto, Markus Törmä, Eeva Bruun, **Finnish Environment Institute (FI)**

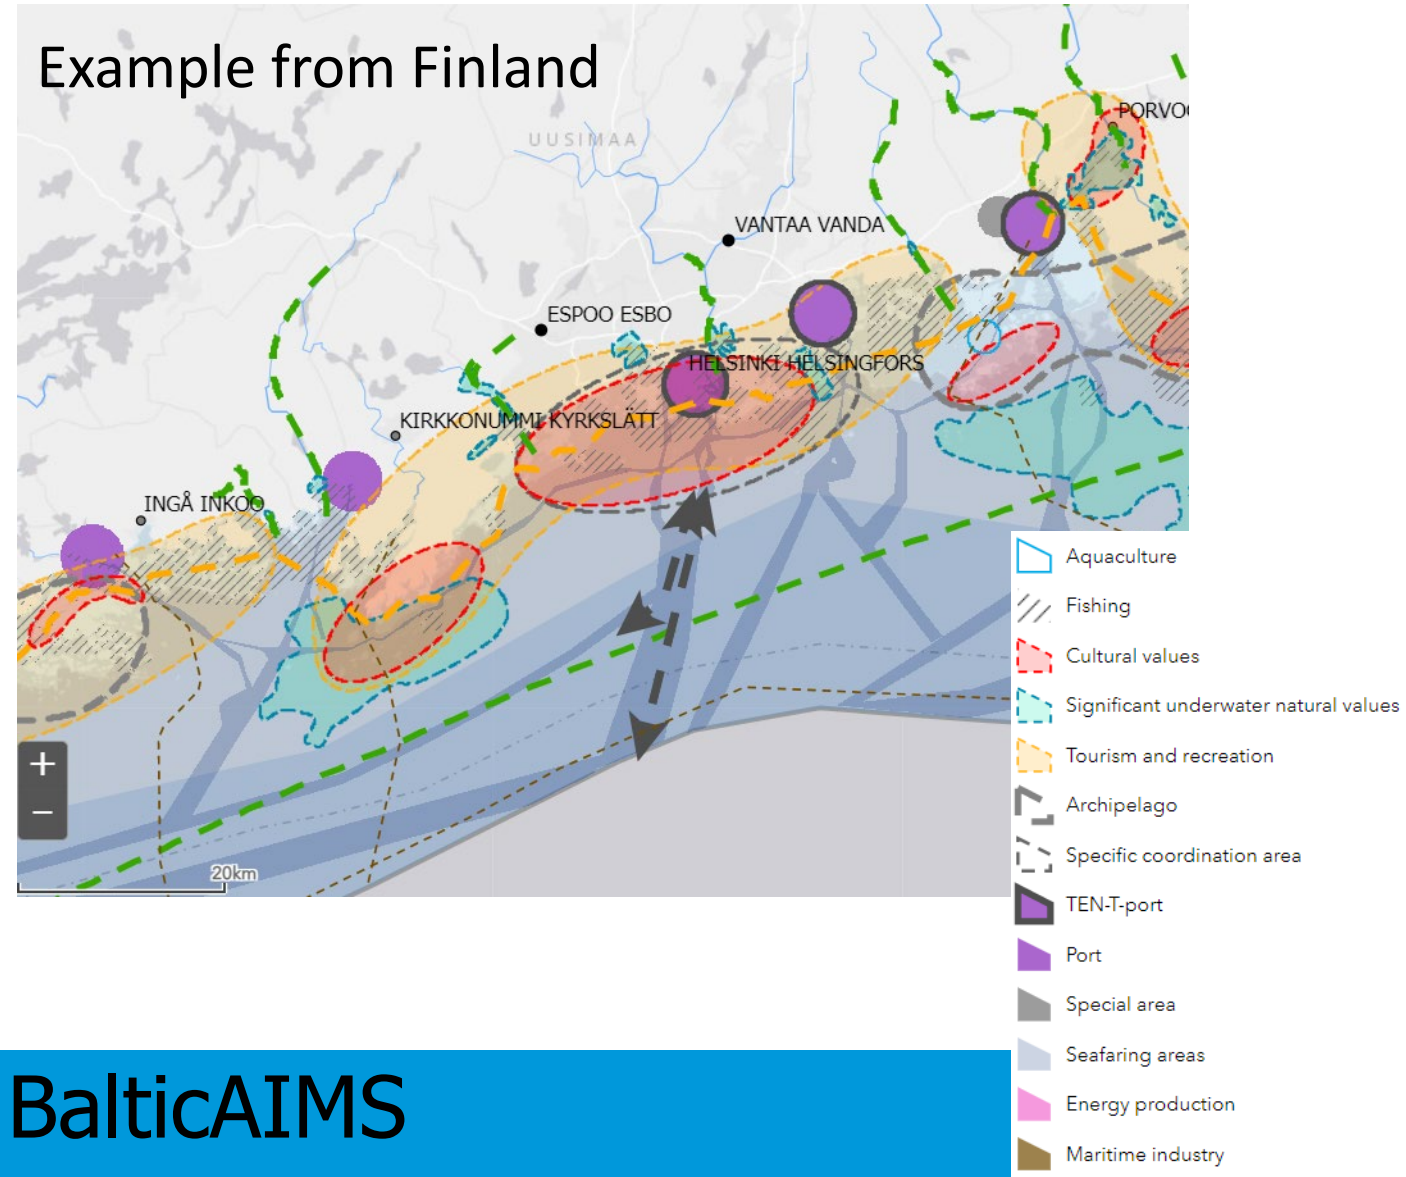

Carsten Brockmann, Martin Böttcher, Kerstin Stelzer, Carole Lebreton, Gunnar Brandt, Tonio Fincke, Norman Fomferra, Alicja Balfanz, Uwe Lange, **Brockmann Consult (GE)**

Petra Philipson, Susanne Thulin, **Brockmann Geomatics (SE)**

Living Planet Symposium  
23 May 2022

# Maritime and Territorial Spatial Planning

- Many areas in the Baltic Sea are not in Good Ecological State
- MSP seeks to improve of the state of the environment by mitigating human impact on sea health
- Coordination and implementation of various practices and policies
  - Defining areas where certain activities could be practiced to minimize overall impacts
- Monitor the effects of these activities

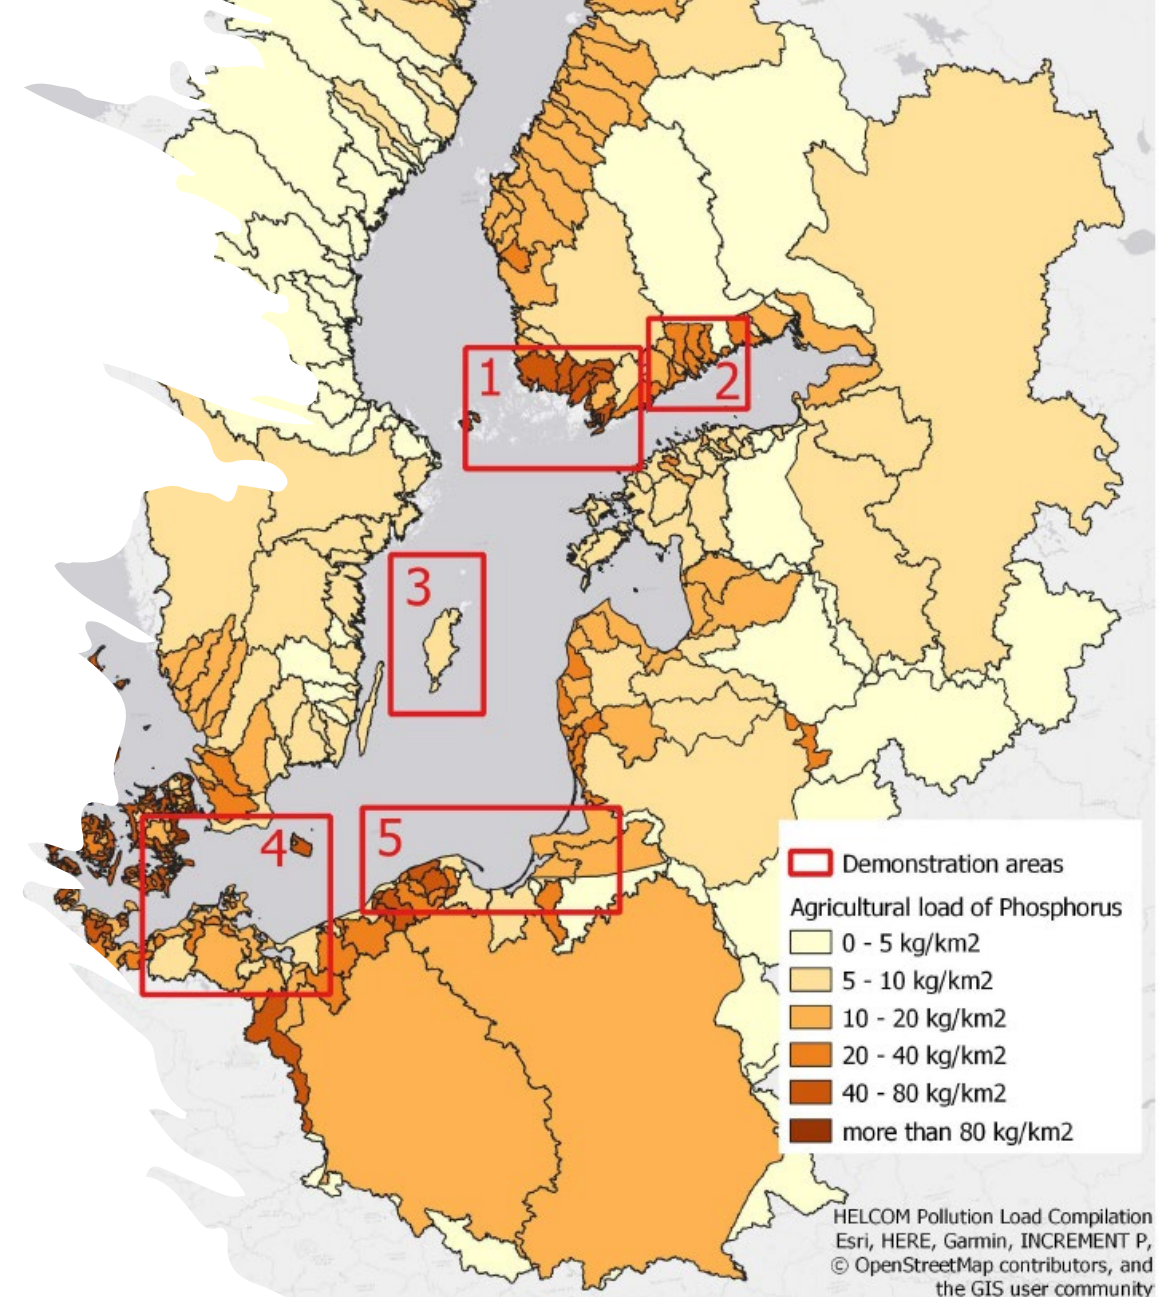

# Our motivation

- For MSP, large information gaps exist
- EO can help by providing information on
  - State of the coastal environment
  - Activities in the catchment areas
- Access to EO data is not convenient for non-expert users and MSP experts. Combining EO observation with GIS and other material is laborious
  - Our objective is to help MSP: **demonstrate** an *integrated data approach for essential processes of land and coastal water areas to better analyse and visualise the interactions.*

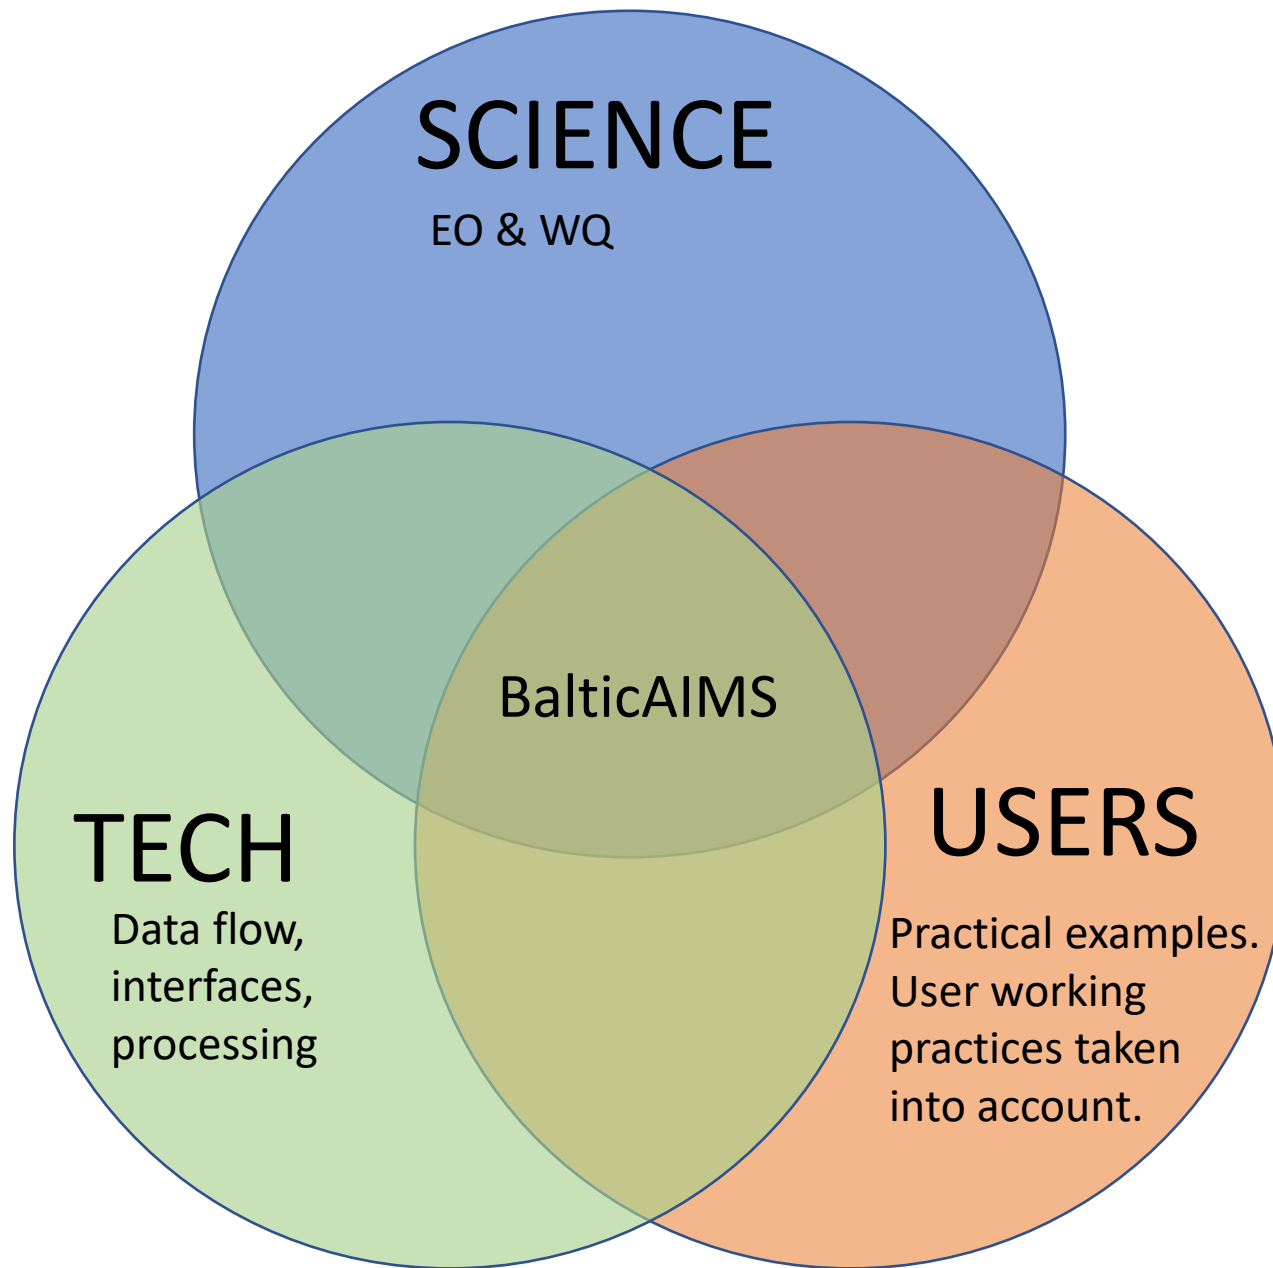

# In practice

- Create data access, visualization and analysis systems and tools for demo areas in the Baltic Sea
  - GIS material relevant for MSP, human impacts and pressures
  - In situ water quality (monitoring stations, Alg@line ferrybox, automated stations)
  - EO and model datasets
- A parallel project led by Tiit Kutser, Estonia

How do we differ from other platforms?

Specific focus on the Baltic Sea and MSP

# BalticAims Schedule

## Spring 2021

User requirement specification

- Regional (e.g. HELCOM) & national authorities, ~30 persons interviewed

## Summer 2021 – Spring 2022

System definition and development of information services based on user needs

## Summer – Fall 2022

Demonstrations:

- Examples by the team
- Users can access the data

## Jun. 2022 – Feb. 2023

User comments and further recommendations

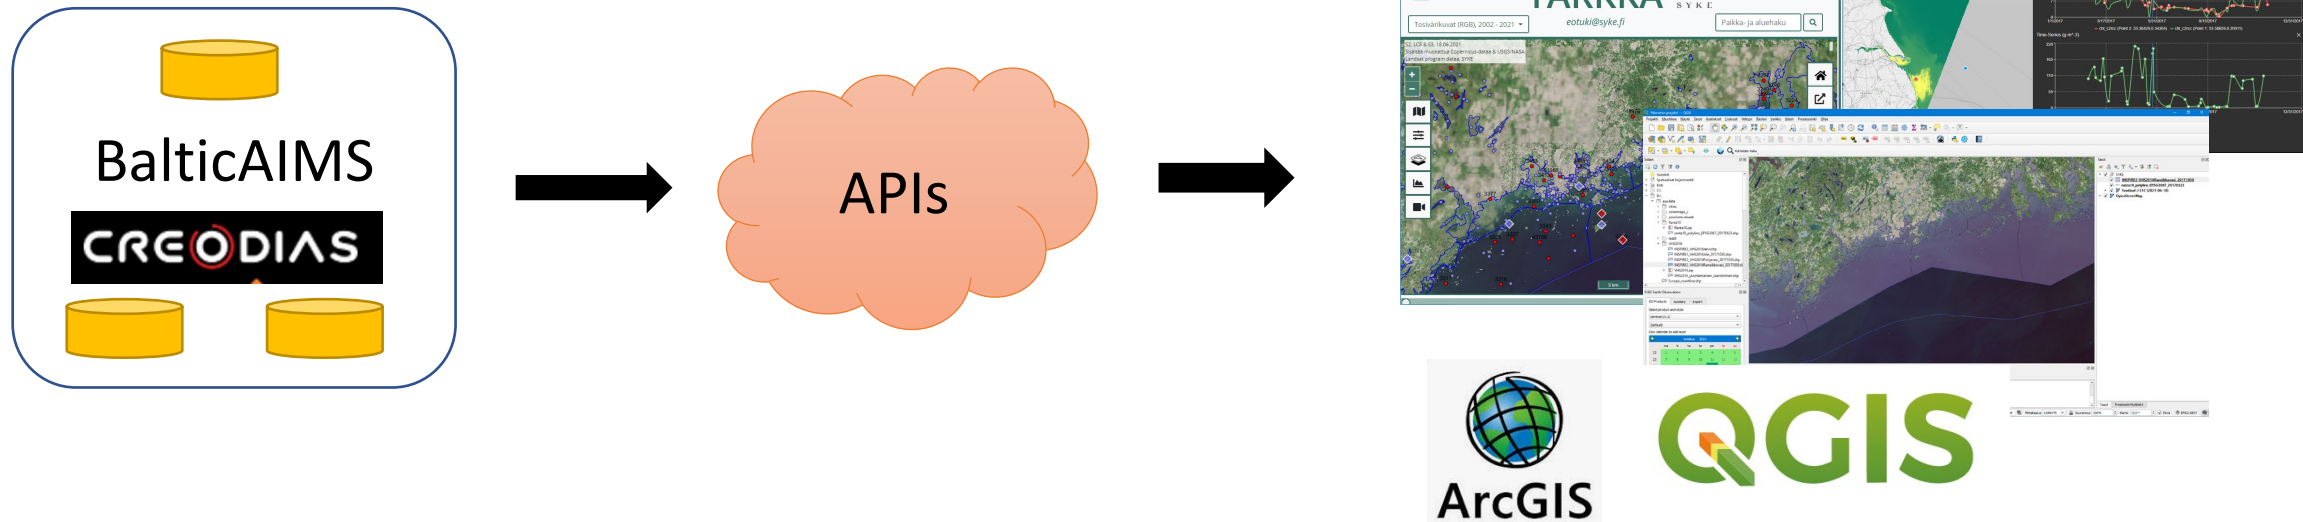

Baltic Workshop (Oct 2022)

## 2023/2024? →

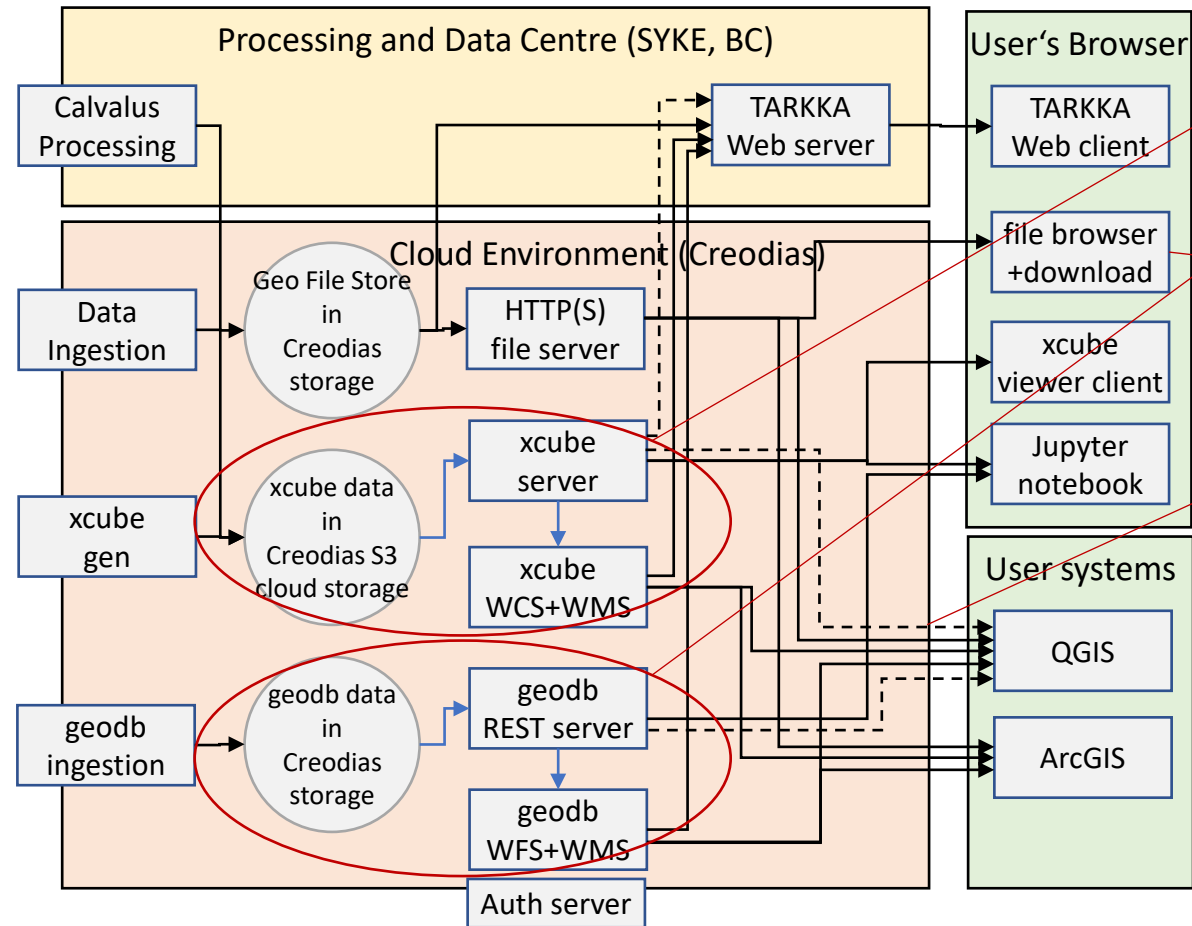

Next step: A larger scale project

# BalticAIMS data flow

- Demonstration system utilizes a backend (data sources) connected to three different data exploration interfaces through APIs

# Backend

xcube serves time series of image data

geodb serves features and their time series

File server for pragmatic file access

OGC and REST interfaces for integration into user clients

Tarkka, viewer, notebooks as generic clients

Processing and ingestion to add collections and to extend the time series

[links at www.balticaims.eu/](http://www.balticaims.eu/)

# Frontends

Public viewer to familiarize with the datasets:

Browser-based, ready to use Graphical User interface

BALTIC AIMS interface

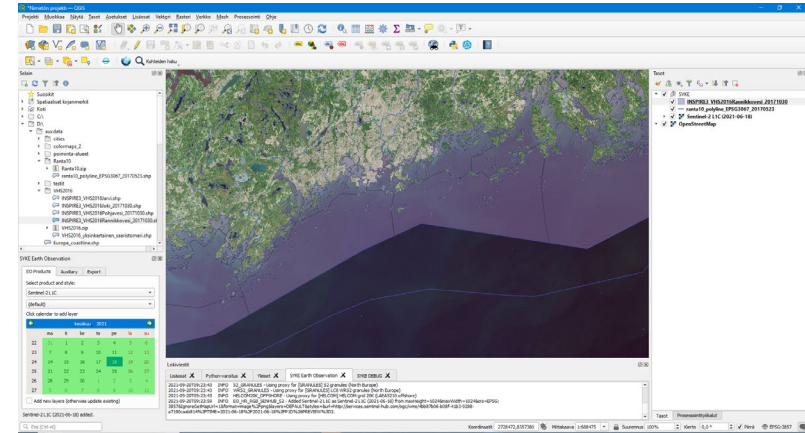

- EO**
  - RGB
  - EO turbidity
  - Cases, where human impact are clear
  - Seasonal (summer, spring turbidity, chl-a)
  - Algae blooms
  - Wintertime RGBs
- GIS**
  - Available GIS material on coastal activity
  - GIS material, where human impacts identified from EO material are identified (TBD)
- Stations**
  - Coastal stations (WQ)
  - Automated temperature network

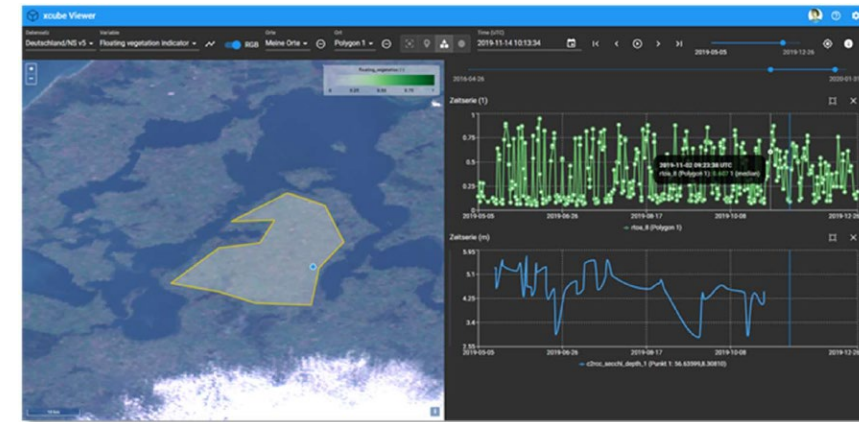

[www.syke.fi/TARKKA/en](http://www.syke.fi/TARKKA/en)

Access the data in GIS applications

XCube viewer (browser based)

# Showcases and user stories

**A:** EO based information to be used in user **legacy systems** for spatial planning

**B:** Monitor the effects of **nutrient flow** from the drainage basin to the coastal waters

**C:** Monitoring the impacts of **coastal activities**

**D:** **Combination** of Coastal Zone mapping and CMEMS coastal water quality material

**E:** Monitoring of **temperature anomalies**  
→ upwelling & input of heat

A1: Material to support the review of MSP Plans  
A2: Human impact  
A3: Hotspots

B1: Impact of agriculture  
B2: PLC subgroup  
B3: Monitoring of nutrient reduction measure

C1: Dredging Helsinki  
C3: HELCOM dredging & dumping  
C2: Water quality coastal Finland  
C4: HELCOM human pressures

D1: Wind park  
D2: Aquaculture footprint  
D3: Coastal land use

E1: Helsinki city coastal water temperature  
E2: Climate change

# PLC subgroup use case (Germany)

Interests are in the influence of nutrients on coastal water. Users want to combine model results and nutrient information from point sources with EO water quality information

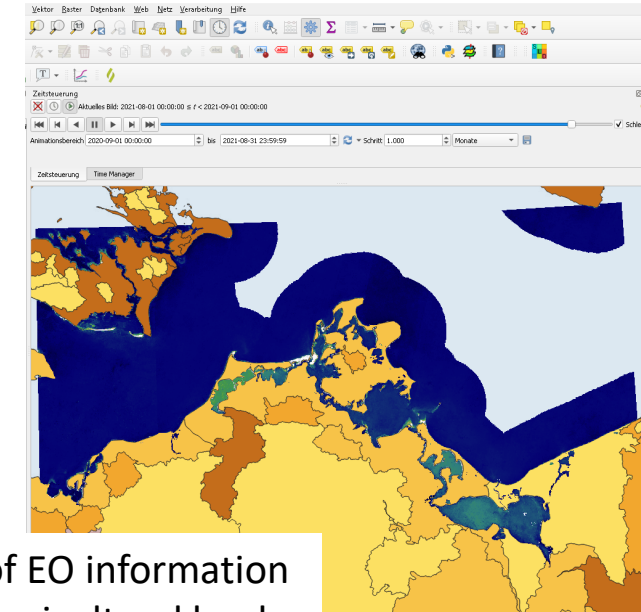

Regional statistics along inflows

HELCOM Assessment

EO data

Combination of EO information with nutrient agricultural loads

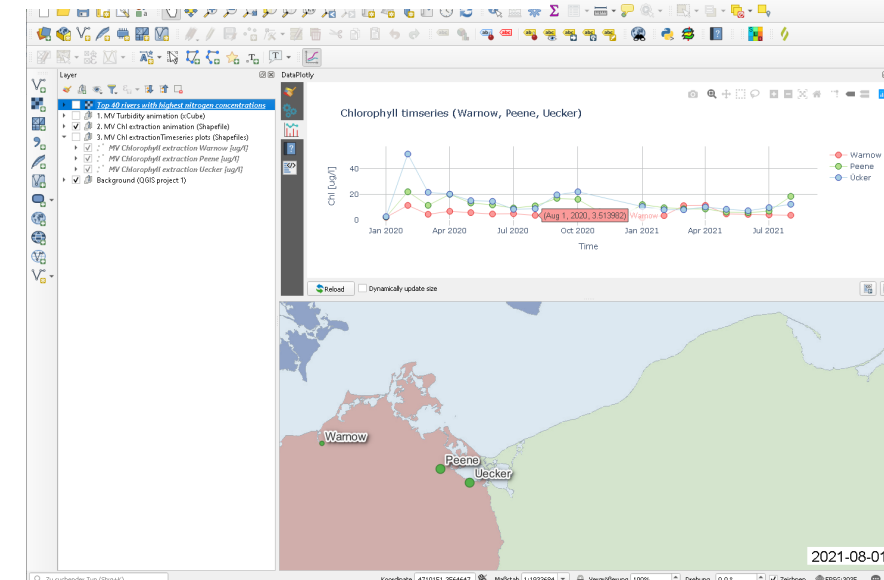

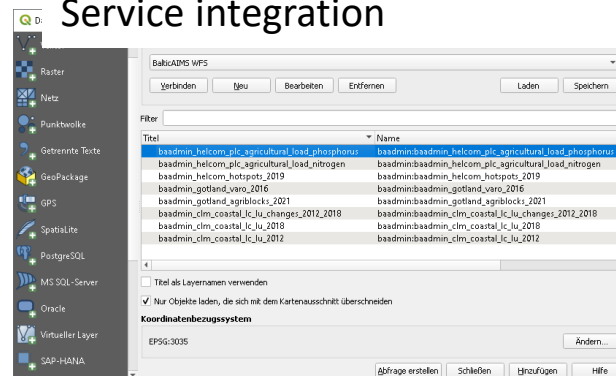

## EO

- Demonstrative set of RGB, EO turbidity
- Seasonal, timeseries (summer, spring turbidity, Chl-a)

## GIS

- Available GIS material on coastal activity (human pressures)
- Link EO information to GIS Stations
- River/Coastal stations (WQ and nutrient load)

BalticAIMS Web Feature Service integration

# Environmental authorities use case - Gotland

Can nutrient reduction measures upstream be observed by EO in the coastal waters?

## EO

- RGBs, Chl a and Turbidity
- Daily estimations for analysis of short-term events
- Near shore sites where riverine outlets affect the coastal waters.

## GIS

- GIS material on nutrient reduction measures
- Local information on drainage basins and water ways

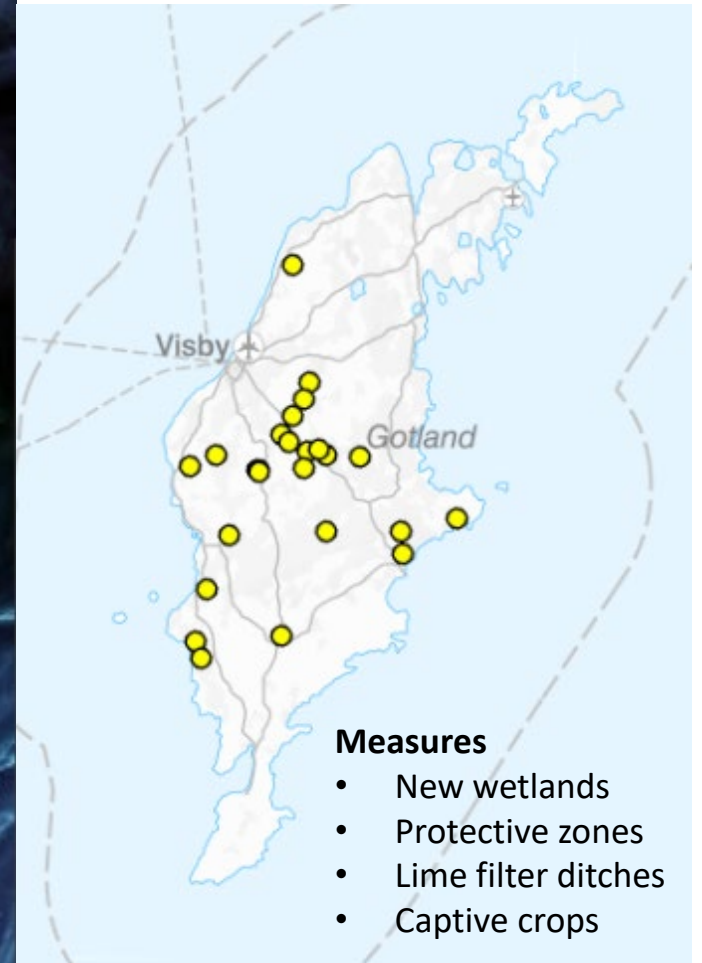

## Stations

- Coastal stations (WQ)
- Automatic sensor network upstream

Coastal waters affected by leakage from agricultural areas, but also nutrients streaming from other BS regions.

Implemented measures against eutrophication

# Coastal city use case (Helsinki region)

Interests are in human impacts on coastal water quality and water temperature

**EO**

- Demonstrative set of RGB, EO turbidity
- Cases, where human impact are clear
- Seasonal (summer, spring turbidity, Chl-a, ice)

**GIS**

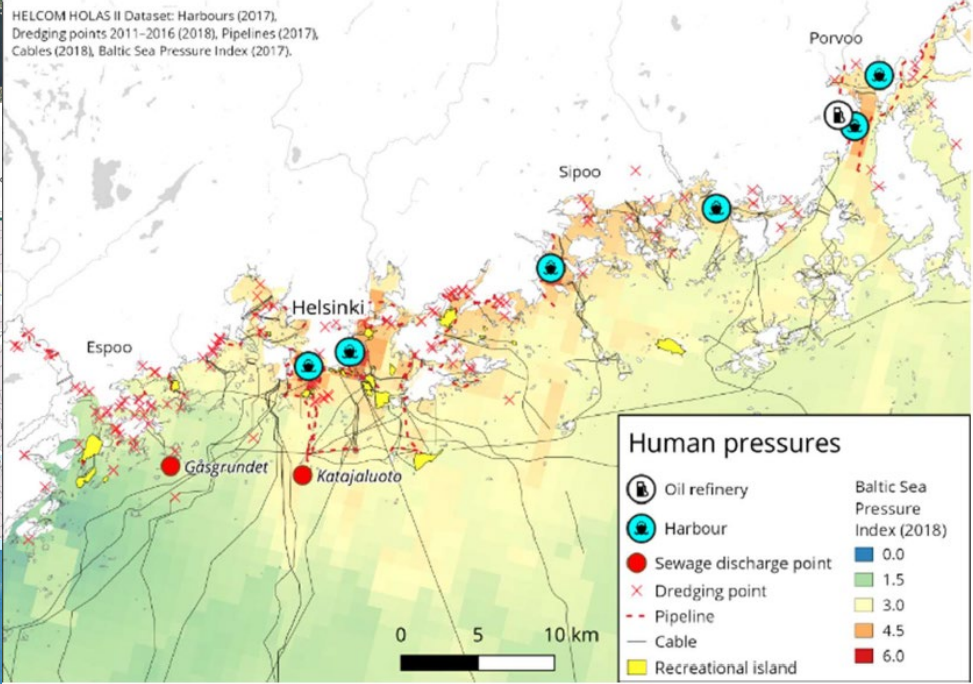

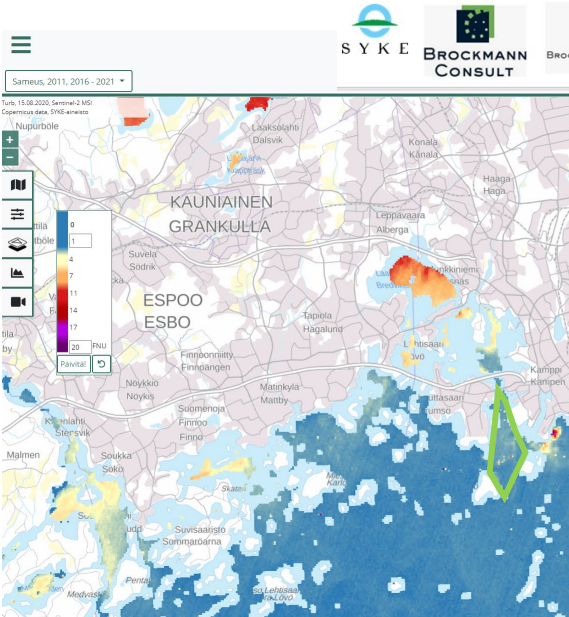

- Available GIS material on coastal activity (human pressures)
- GIS material, where human impacts identified from EO material are identified

**Stations**

- Coastal stations (WQ)
- Automated temperature network

- Active dredging and dumping areas identified
- Riverine impact areas
- Regular ship route in harbor

**Human pressures**

- Oil refinery
- Harbour
- Sewage discharge point
- Dredging point
- Pipeline
- Cable
- Recreational island

**Baltic Sea Pressure Index (2018)**

- 0.0
- 1.5
- 3.0
- 4.5
- 6.0

Select theme <

MSP - Dredging ▾

Turbidity ^

- Coastal water turbidity
- HROC turbidity
- MS turbidity (VESLA)

GIS data ^

- Coastal water dredging areas
- Reference station areas
- Nature reserves

# Coastal temperature anomaly monitoring

# Coastal temperature anomaly monitoring

# Summary

- Service demonstration phase ongoing (until Oct 2022)
  - More examples, data and functionalities on the way
- Website: [www.syke.fi/projects/BalticAIMS](http://www.syke.fi/projects/BalticAIMS)
- Baltic Workshop coming in Oct 2022 (Helsinki & online)
- Additional info about open TARKKA service and demo possibilities at a poster by Hanna Alasalmi (E3.04 today) or at the Brockmann Consult booth
- Contact & more info: [sampsa.koponen@syke.fi](mailto:sampsa.koponen@syke.fi)

# Main requirements by large group of national authorities and HELCOM group experts

- Main interest was on receiving more observations on coastal processes related to
  - Separating human impacts from natural background changes
  - More information on water quality & human impact on coastal waters
  - Data gaps particularly in spring and wintertime
- How much of this can be achieved with satellite observations?
  - Many of the requirements can be met by combining satellite observations of turbidity, chl-a, temperature, ice cover to available GIS material & monitoring information
    - > EO can be utilized to complement the existing coastal GIS material for MSP
  - BalticAims-project works on the demonstration areas, but most cases can be expanded to Baltic Sea wide material later.
