OCRA & ROCINN – recent improvements (I)

- OCRA clear-sky maps are updated to include 3 years of TROPOMI data and a L1 degradation correction
→ operational since version 2.1
- ROCINN surface albedo climatology is replaced by daily surface albedo retrieval (GE_LER) using TROPOMI measurements and surface albedo map is updated on a daily basis (G3_LER)
→ operational since version 2.1

FP_ILM algorithm applied to UVN sensors for the retrieval of GE_LER climatologies for UV/VIS trace gases and clouds Speaker

OCRA & ROCINN – recent improvements (II)

- ROCINN ice cloud parameterisation is under development

→ not operational yet

Validation of the TROPOMI L2_CLOUD product

Routine validation with ground based data

- Routine validation of the TROPOMI L2_CLOUD product is performed with ground based CLOUDNET data in the S5P MPC framework (now ATM MPC)

Compernolle et al.: Validation of the Sentinel-5 Precursor TROPOMI cloud data with Cloudnet, Aura OMI O₂–O₂, MODIS, and Suomi-NPP VIIRS, Atmos. Meas. Tech., 14, 2451–2476, <https://doi.org/10.5194/amt-14-2451-2021>, 2021

Comparison of the TROPOMI L2_CLOUD product with satellite data

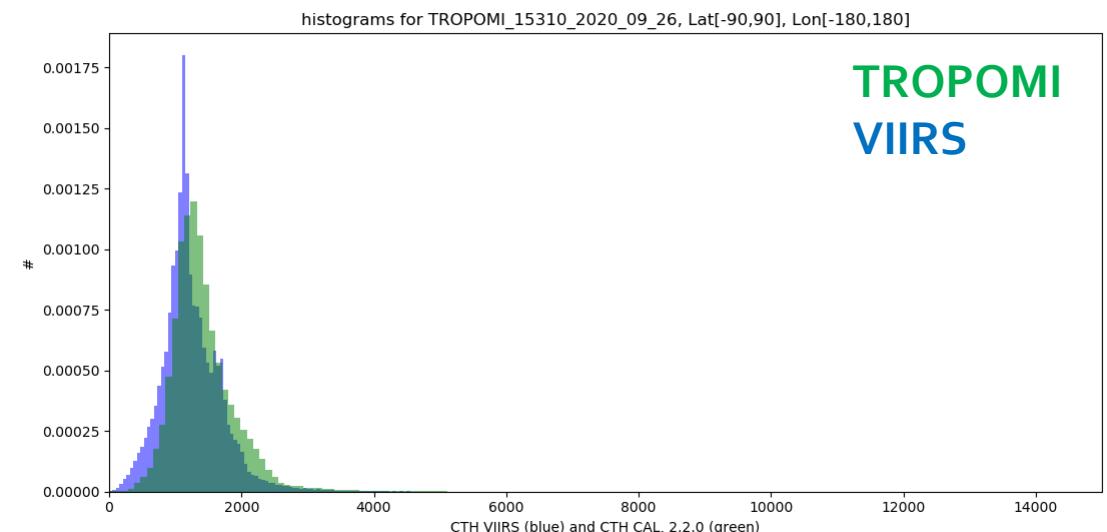

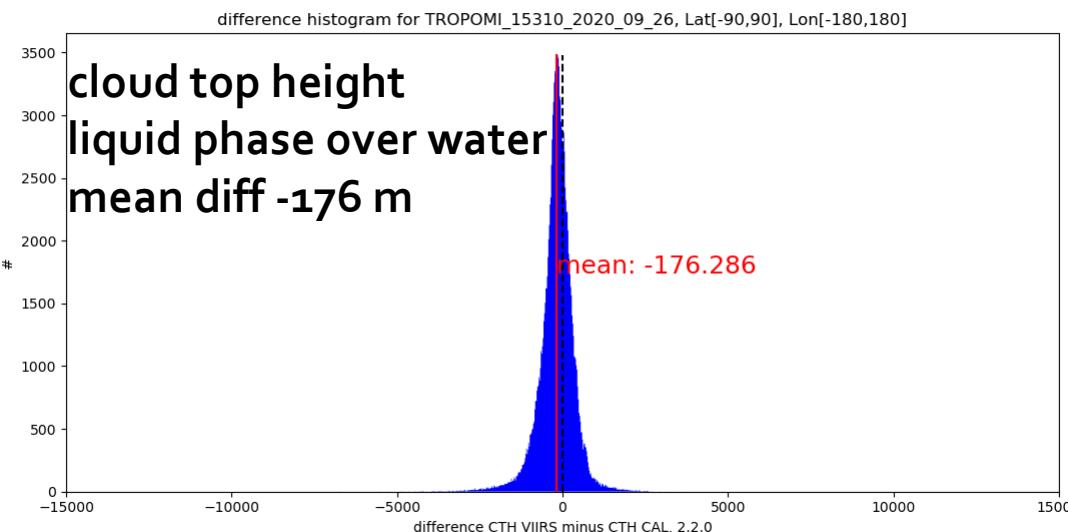

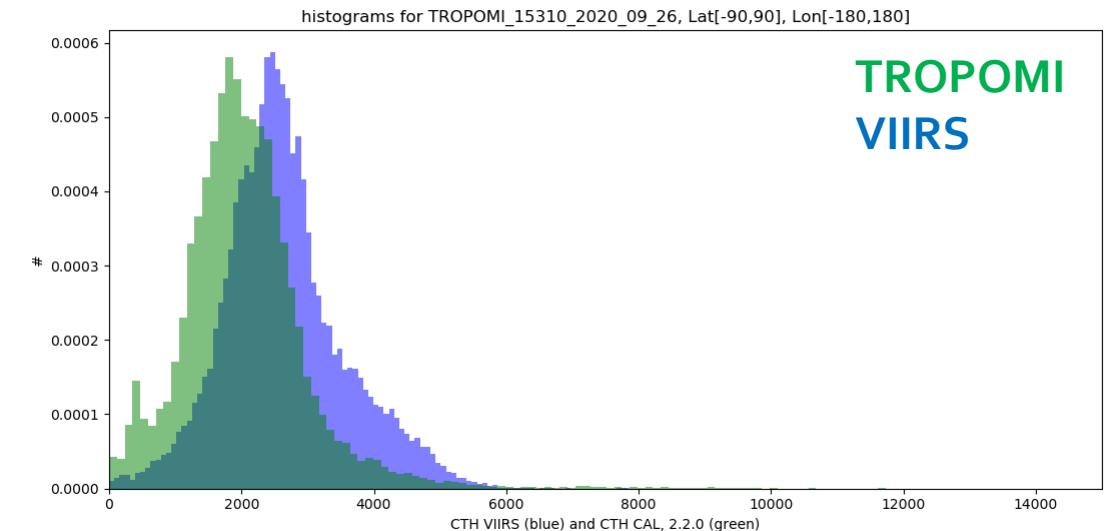

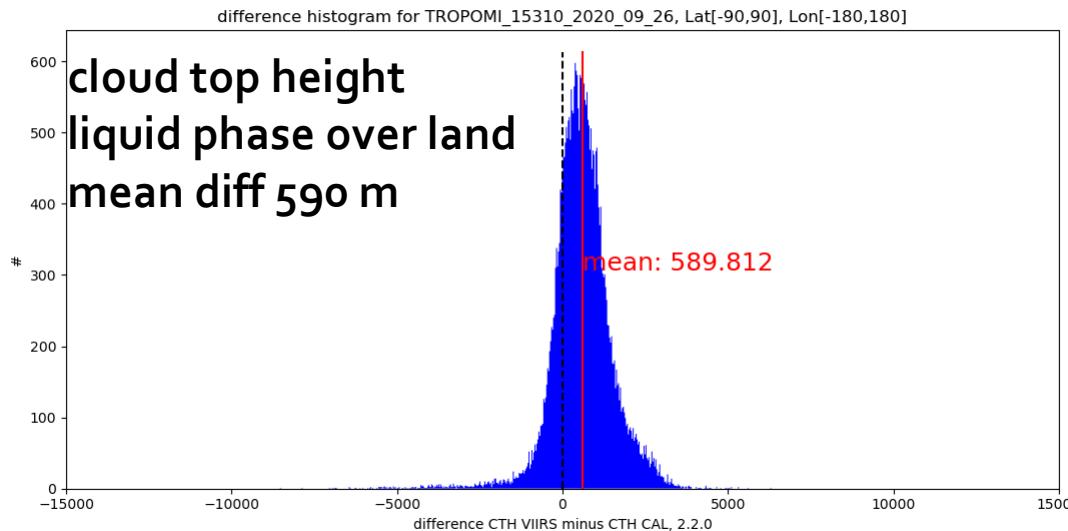

Comparison with satellite data from VIIRS/S-NPP

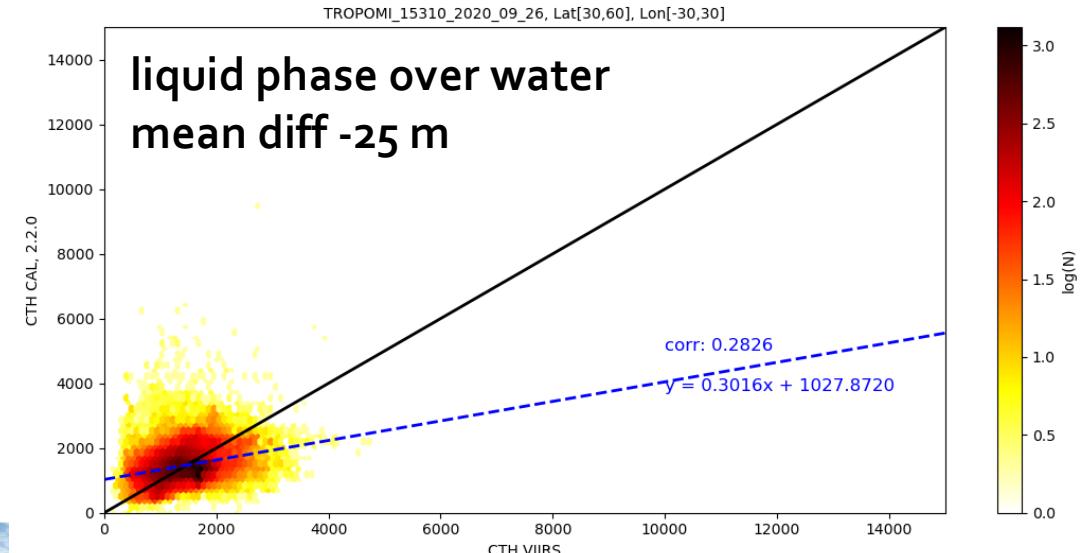

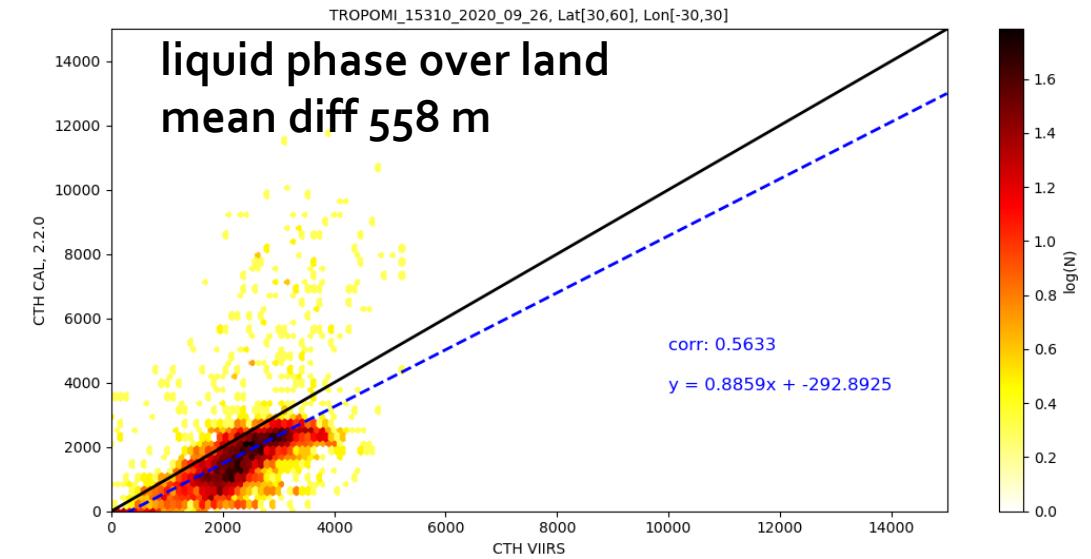

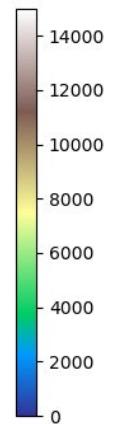

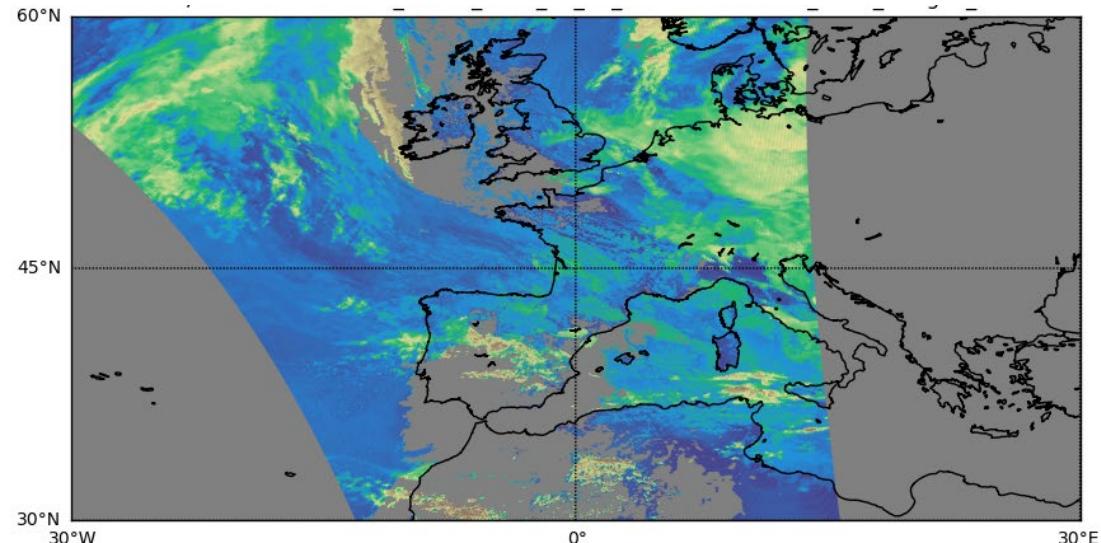

- close formation with S5P allows for reasonable spatio-temporal comparability
- Re-gridded VIIRS cloud test products have been generated by RAL in the framework of the S5P MPC
- Test data from 11 September 2020, orbits 15091 to 15104
 - Compare ROCINN_CAL CTH with VIIRS CTH
 - Consider different data subsets based on
 - Surface condition: land only, water only
 - Cloud phase: liquid phase only

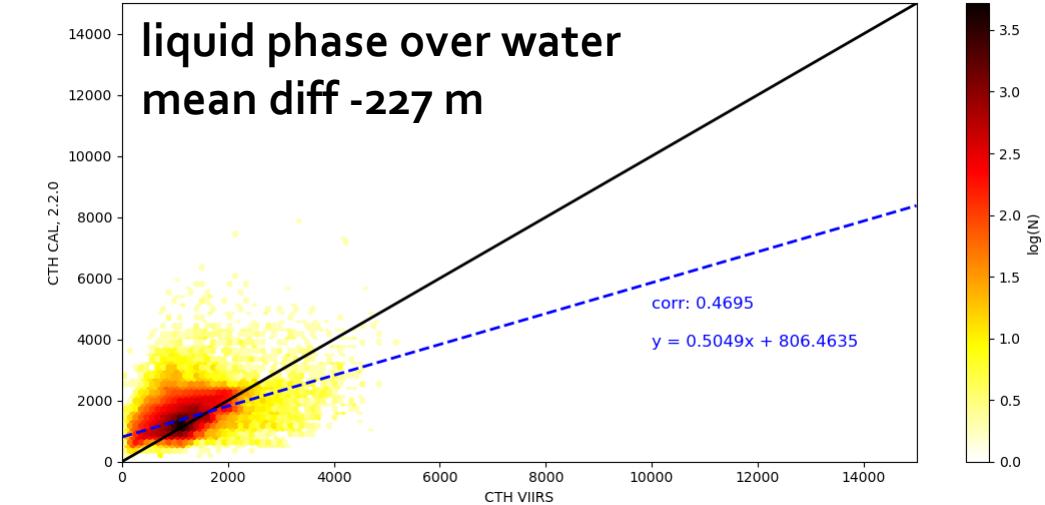

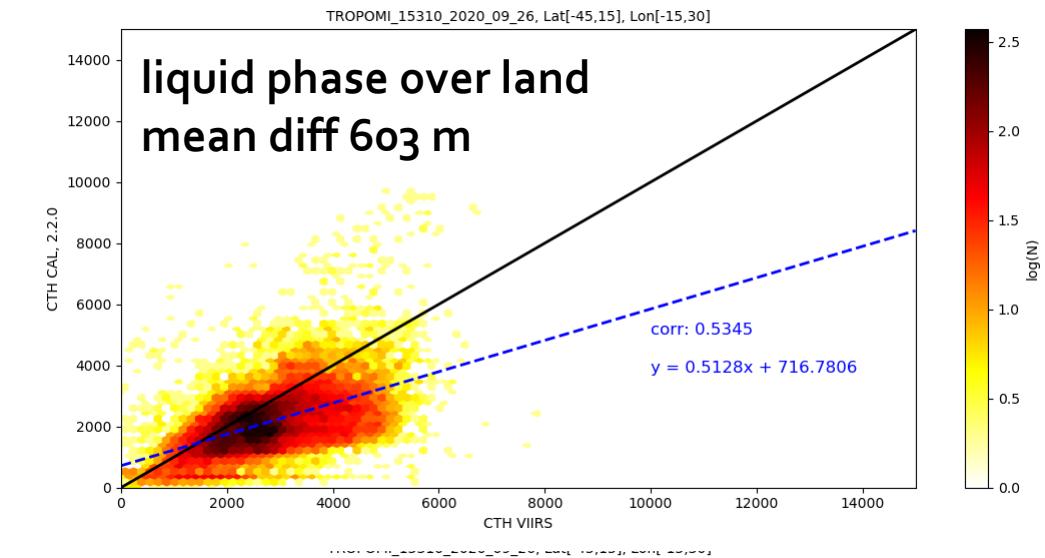

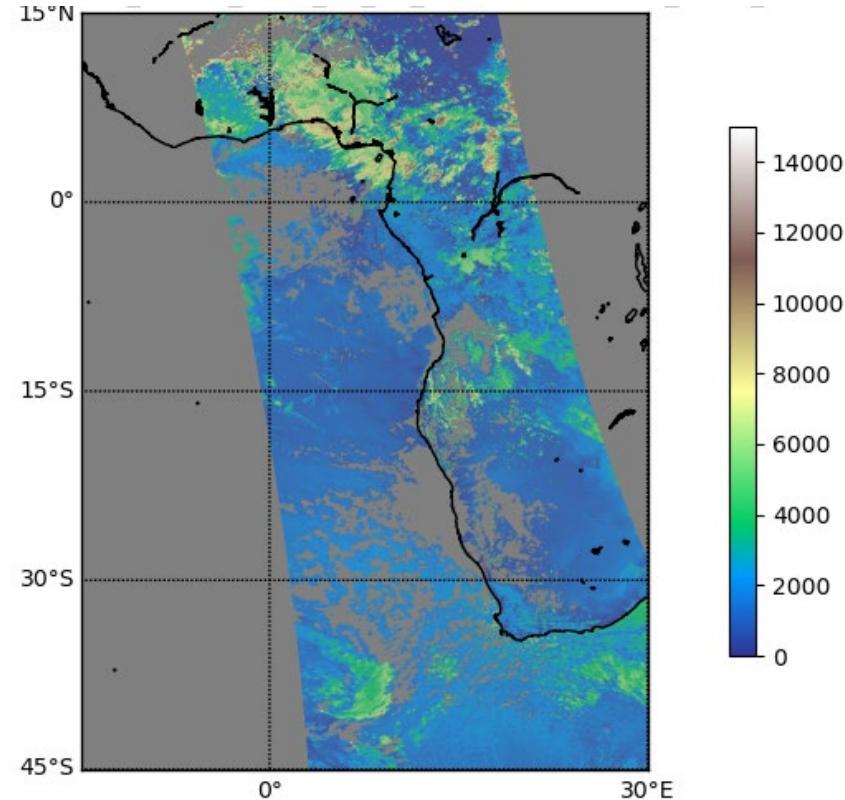

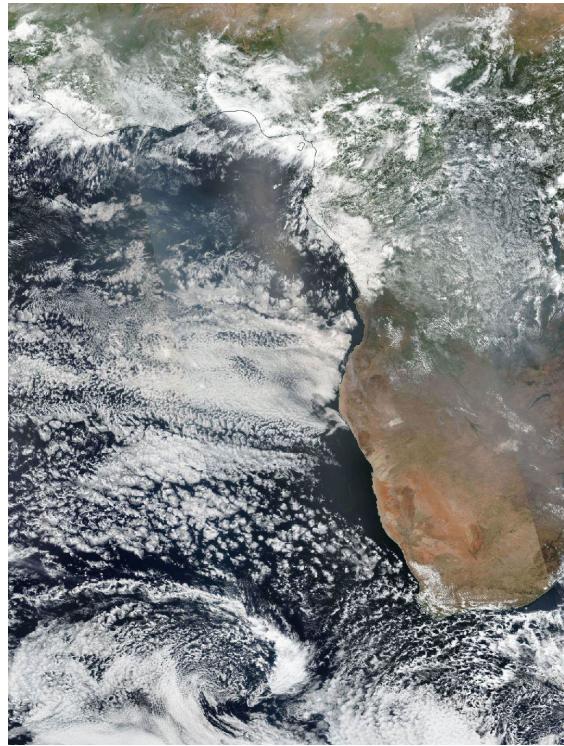

Comparison with satellite data from VIIRS/S-NPP – Global

Comparison with satellite data from VIIRS/S-NPP – Regional: Europe

Comparison with satellite data from VIIRS/S-NPP – Regional: Africa

Comparison with satellite data from VIIRS/S-NPP – Cloud masking

Compare OCRA/ROCINN and VIIRS cloud fractions as tool for cloud masking:

Assumption "clear": $CF < 0.05$

Assumption "cloudy": $CF \geq 0.05$

For the global data, we find an agreement in **88%** of the cases assuming the threshold 0.05

Cloud fraction threshold 0.05	TROPOMI clear	TROPOMI cloudy
VIIRS clear	24% True Positives	5% False Negatives
VIIRS cloudy	7% False Positives	64% True Negatives

Conclusion and Outlook

Conclusion

- Cloud top heights agree better over water than over land. Mean differences VIIRS minus TROPOMI are:

	Global	Regional (Europe)	Regional (Africa)
liquid phase over land	590 m	558 m	603 m
liquid phase over water	-176 m	-25 m	-227 m

- Cloud fractions agree well when used for cloud masking:

✓ Agreement in 88% of the cases for a 0.05 cloud fraction threshold

Outlook

- Extend comparisons to cloud optical thickness
- Extend comparisons to ice phase clouds once the proper parameterisation has been added to ROCINN_CAL
