TAKING THE PULSE
OF OUR PLANET FROM SPACE

EO Analytics for societal challenges

Stefano Natali, SISTEMA GmbH
Alessandro Cimbelli, Vodafone Italia, Vodafone Spain

May 24th 2022

ESA UNCLASSIFIED – For ESA Official Use Only

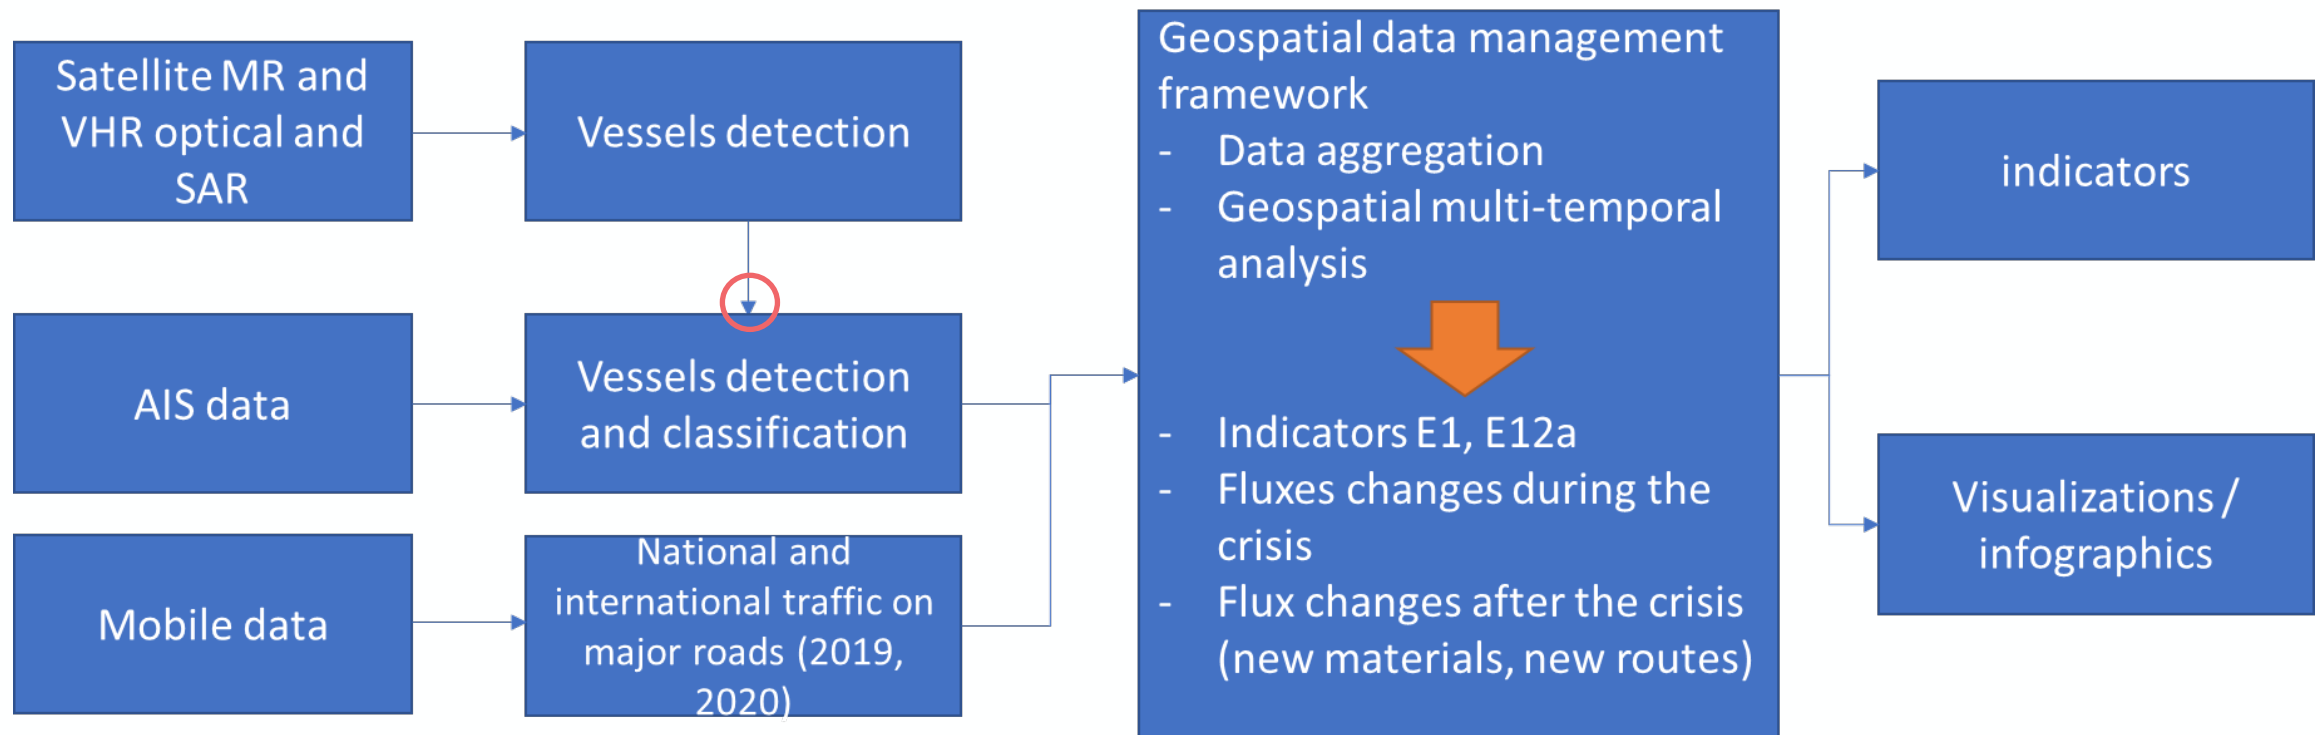

→ THE EUROPEAN SPACE AGENCY

Demonstrate the capabilities achievable **fusing together Earth Observation data with mobility data and other geospatial data (AIS)** to assess the economic impact of COVID19 in two economic sectors:

- **Logistic hubs traffic** (dynamics across 2020 and 2021)
- **Agriculture** for work-intentsive / less mechanised crops (field preparation, gathering)

Concept: to perform an integrated maritime traffic / land traffic analysis to assess the impact of COVID in established fluxes.

Logistic hub evolution

SISTEMA

Detecting ships docked at a pier from space gets easier as much the spatial resolution increases – reality?

Sensor	Date	Image features

- Satellite / AIS data fusion

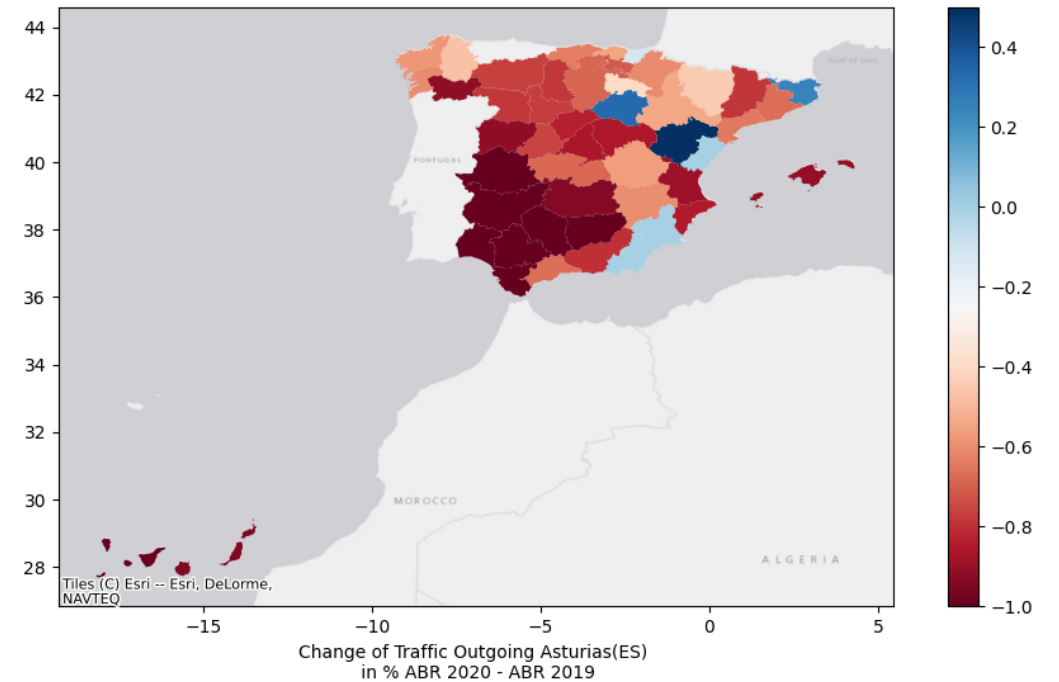

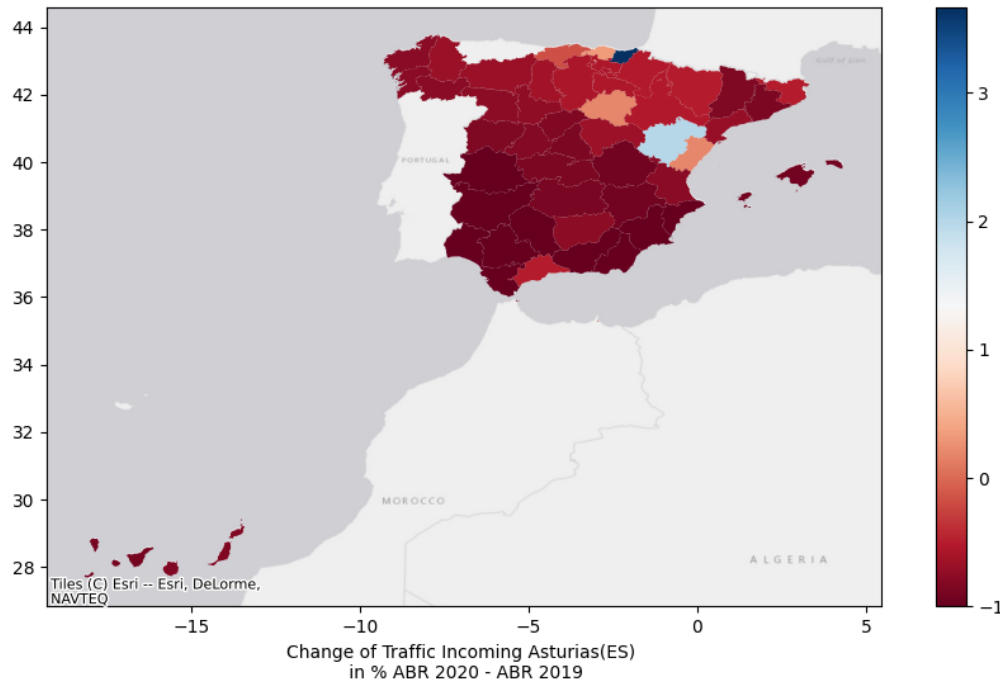

- Number of ships at pier: second semester 2019 to first semester 2021.

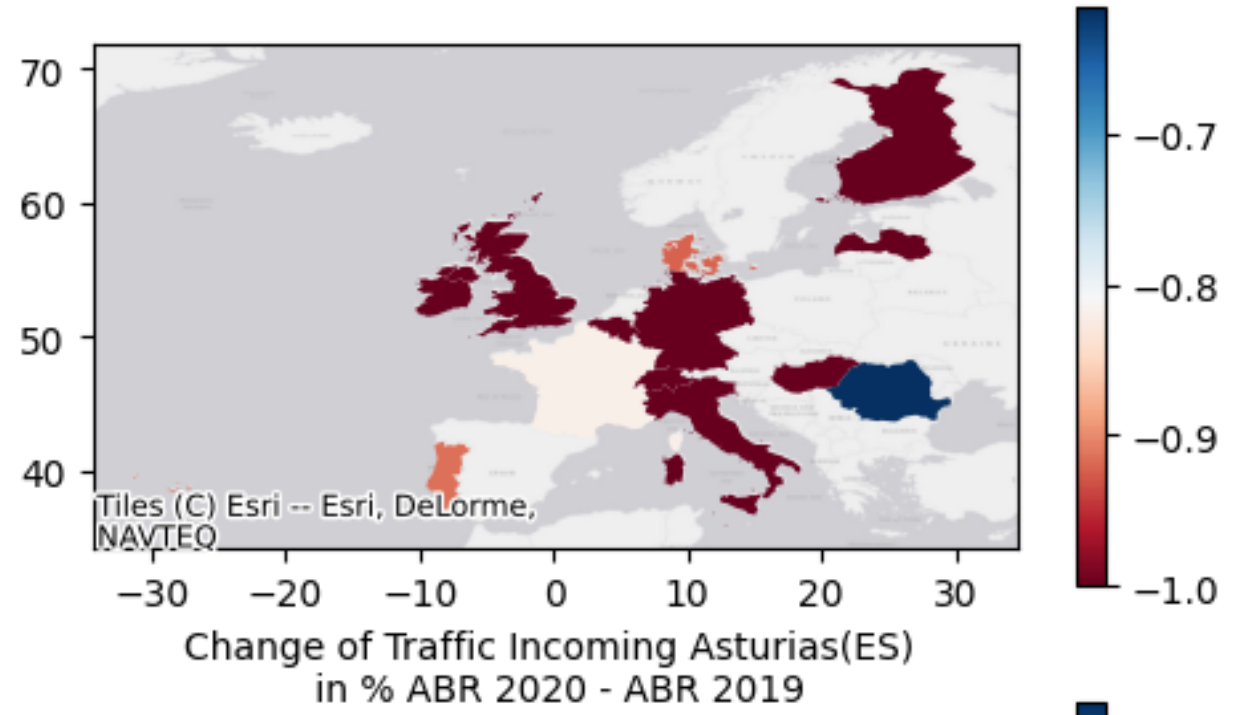

- ▶ Road Traffic Analysis - Vodafone Data
- ▶ Which data are collected:
 - ▶ **National:** incoming and outgoing trucks from / the Gijon region (Asturias)
 - ▶ **International:** incoming trucks to Asturias

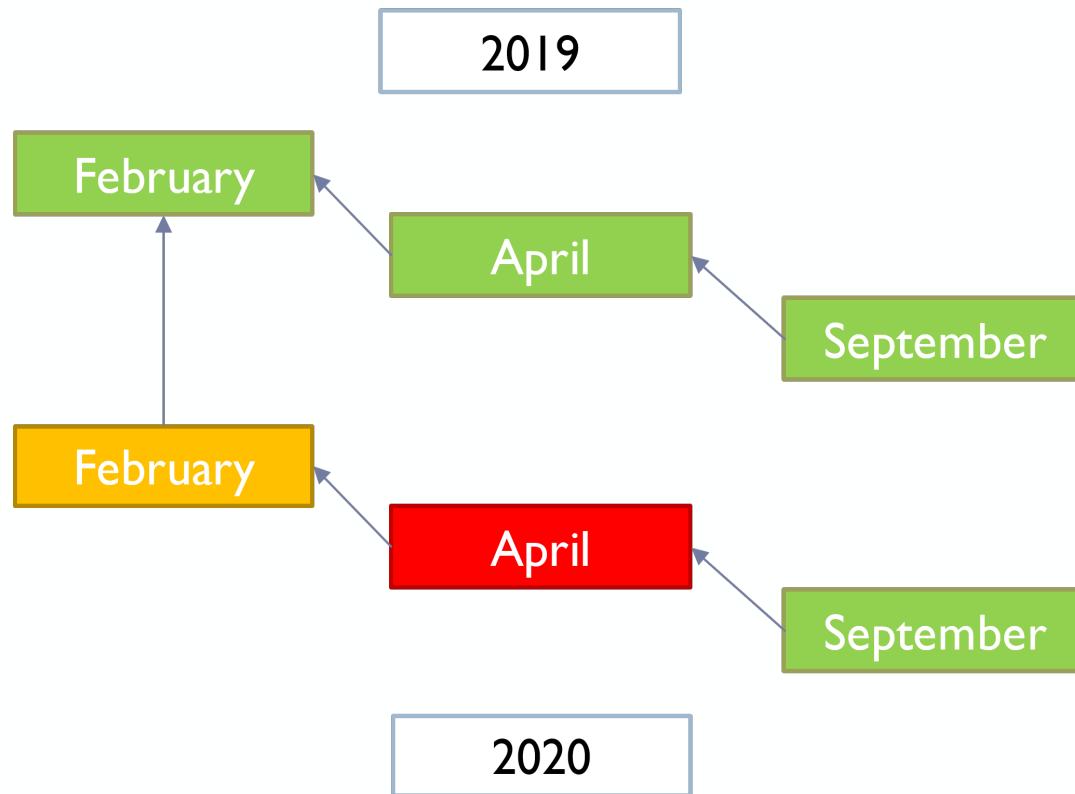

- ▶ Road Traffic Analysis - Vodafone Data
- ▶ Change of Incoming and Outgoing Traffic from Asturias (ES) between April 2020 and April 2019 in %

- ▶ Road Traffic Analysis Vodafone Data
- ▶ Change of Incoming Traffic from Asturias (ES) between April 2020 and April 2019 in %

► E12 named as “Change in commercial fluxes”

Scope:

analysis of flux / anomalies of workers of agricultural fields across lockdowns

Input data:

Satellite data (HR / VHR optical data)

mobile data and services (presence within an area, roaming, visitors, workers)

Expected output:

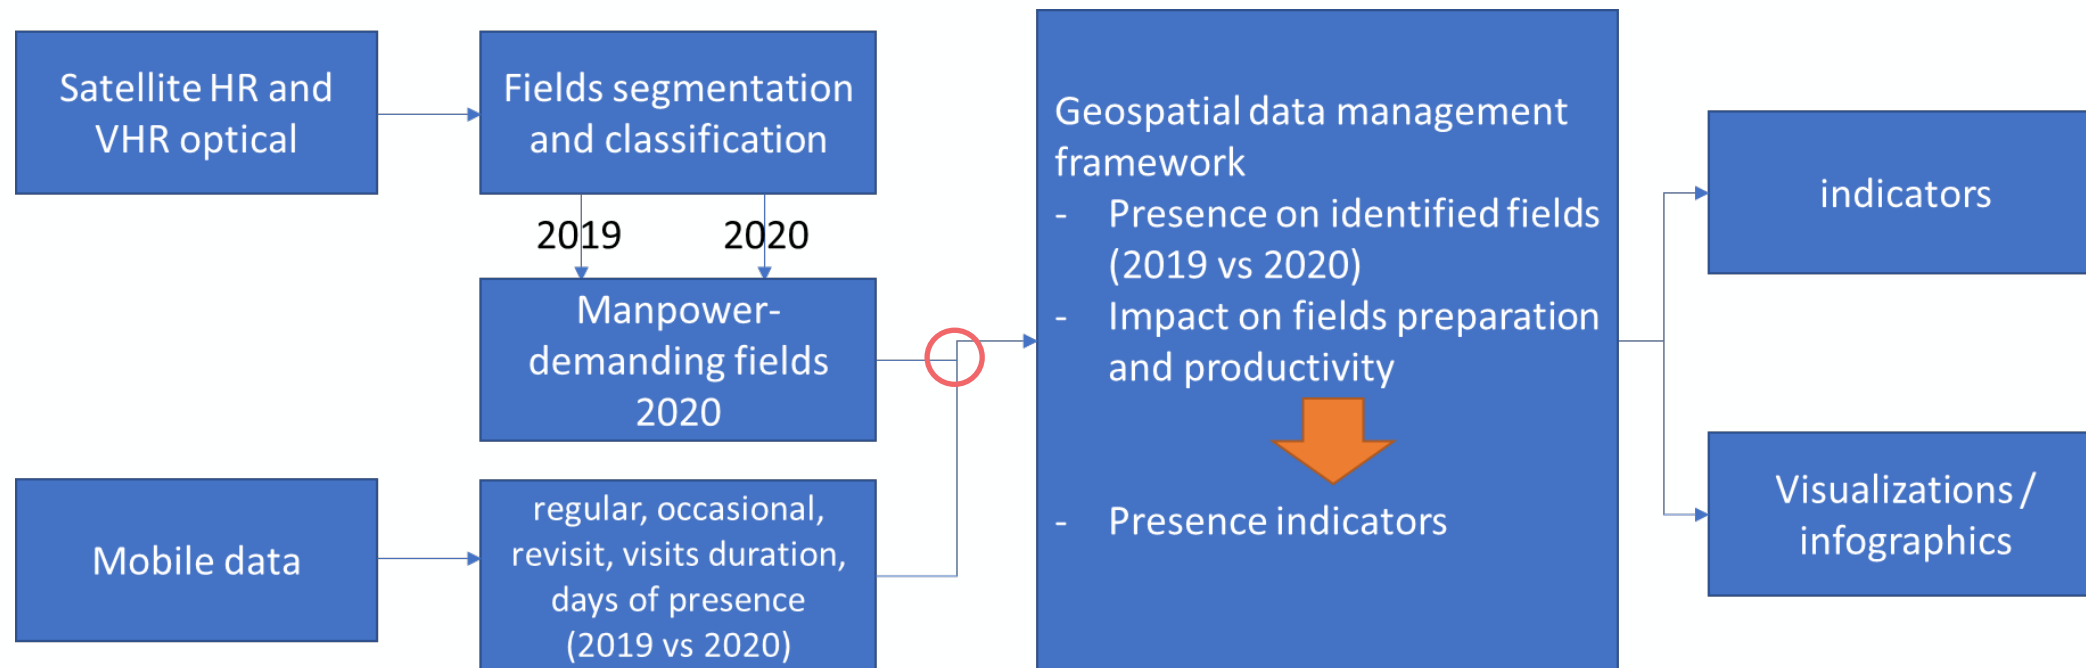

Identification of worked / not worked fields

Identification of regular / irregular work activities

Changes of workers in field per time range (pre / during / post pandemic)

Concept: to use satellite data to

- Estimate the behaviour of agricultural fields across the pandemic
- identify the areas on which to focus the mobile data analysis.

Impact of COVID on agriculture

SISTEMA

Map of the harvesting period

Map of total number of

Estimated reduction of tomatoes production 2020 vs 2019: ~ 13% (verified with production data)

The loss has been higher for vegetables in late summer than for cereals during June and July

Data Fusion approach:

1. **Identification Vodafone cells belonging to specific agriculture class** (“aree a vegetazione sclerofilla”) (regional land cover database, crop classification from satellite)
2. Extraction of Vodafone data, per month (04/2019, 08/2019, 04/2020, 08/2020):
 - #Italian: external worker (IE)
 - #italian: Internal worker (II)
 - #Foreigner with Italian SIM: external worker (FIE)
 - #Foreigner with Italian SIM: internal worker (FII)
 - #Foreigner: external worker (FE)
 - #Foreigner: internal worker (FI)
 - #Masked: external worker (ME)
 - #Masked: internal worker (MI)

Mobile Data analysis

Pros

- Very small time slot (hours)
- Local movements are well represented

Cons

- cells are too large to represent a single phenomenon
- Data are masked for groups less than 15 elements

Summary of the activities

Positive results from fusing together EO data with mobile and other geospatial data (they enrich each other)

- Repeatability

The analyses shall be repeated to capture the full dynamics of the pandemics over years

- Possibility to automate

Very limited at the moment

- Future perspectives

Evolve the prototyped data working framework to simplify the data fusion schemas and move toward (semi)automated tools
