Ocean integration: The needs and challenges of effective coordination within the Ocean Observing System

Based on a collective work from:

Révelard A, Tintoré J, Verron J, Bahurel P, Barth JA, Belbéoch M, Benveniste J, Bonnefond P, Chassignet EP, Cravatte S, Davidson F, deYoung B, Heupel M, Heslop E, Hörstmann C, Karstensen J, Le Traon PY, Marques M, McLean C, Medina R, Paluszkiewicz T, Pascual A, Pearlman J, Petihakis G, Pinardi N, Pouliquen S, Rayner R, Shepherd I, Sprintall J, Tanhua T, Testor P, Seppala J, Siddorn J, Thomsen S, Valdés L, Visbeck M, Waite AM, Werner F, Wilkin J and Williams B (2022) Ocean Integration: The Needs and Challenges of Effective Coordination Within the Ocean Observing System. Front. Mar. Sci. 8:737671. doi: 10.3389/fmars.2021.737671

Ocean integration: what does it mean?

Ocean = complex system → need to combine

- → multiple disciplines
- → multiple in-situ + remote observations
- → multiple numerical models
- → multiple (and nested!) spatiotemporal scales

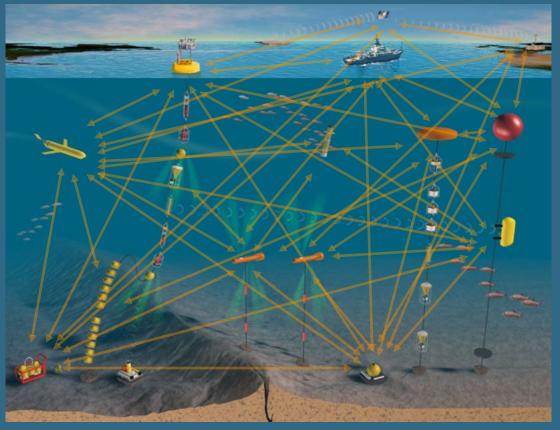

"Ocean integration"

Е

optimally coordinate all these elements

so they are shaped to each other

and form a coherent whole

Adapted from NOAA

Current issues:

- Observing networks only partially adequate
 - → Gaps in ocean observing coverage
 - →Some processes insufficiently measured

Global Ocean Science Report, 2017; 2020 IOC, 2017; NASEM, 2017; 2020 EOOS, 2018; IPCC, 2019; EMB, 2013, 2019; OceanObs'19; Tanhua et al. 2019;

Davidson et al. 2019

- Most observations cannot be used to their full extent
 - → Most observations are not FAIR
 - → Most observations are not fit-for-multiple purposes
- Duplication of effort
 - → Little communication between teams, institutions or nations
 - →Non-optimum use of resources

Current issues:

Gaps in ocean observing coverage

- → Important processes insufficiently measured
- → Observing networks only partially adequate for addressing new scientific challenges
- → Observing networks do not resolve multiple spatiotemporal scales

Global Ocean Science Report, 2017; 2020

10C, 2017;

NASEM, 2017; 2020

EOOS, 2018; IPCC, 2019;

EMB, 2013, 2019.;

OceanObs'19:

Tanhua et al. 2019:

Davidson et al. 2019

Insufficient sharing

- → Lots of observations are not FAIR
- → Most observations cannot be used to their full extent
- → Difficulties in implementing data assimilation and model verification

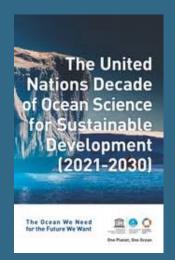

Duplication of effort

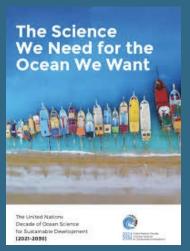

- → Little communication between teams, institutions or nations
- → Observations generally not fit-for-multiple purposes
- → Non-optimum use of resources

Data do not exist

Data exist but they are not available Data exist but they are not fit-for-use

Strong societal expectations

Ocean integration is essential to commensurate with the ambition of the UN Decade of Ocean Science and the Digital Twin of the Ocean

"Building a Digital Twin will require more than connecting and improving what we already have"

It will require:

- A complete disruption and paradigm shift in the way we think and work
- Building a common vision and framework

>> The European DTO is launched

At the One Ocean Summit hosted by the French Presidency of the Council of the EU in February 2022, more than 40 countries united to put the Ocean at the heart of the international political agenda.

To strengthen EU leadership in protecting the Ocean, European Commission President von der Leyen launched the European Digital Twin Ocean (DTO) to support the framework of the EU Mission Restore Our Ocean and Waters by 2030 and to enable the ambition of the European Green Deal.

At the One Ocean Summit, von der Leven explained:

"The ocean is still largely a great mystery for humankind. That is why Europe is building a digital twin of the ocean. We are connecting our assets - like the Copernicus satellites, marine infrastructure like icebreakers, buoys and underwater drones, and high-performance computing. We will gather the raw data and turn it into real-time knowledge and longer-term predictions. We are putting the power of the digital revolution at the service of our climate. (...) Thanks to the EU and its Member States, a digital twin should be operational by 2024. It will make ocean knowledge open-access, available to citizens, scientists and policymakers around the world. It will be a platform for global cooperation. It is about putting the capabilities in place to achieve the commitments we make at this Summit. Together, with the digital twin, we will turn the lights on in the

The European Commission is investing €13 million to develop a core European DTO. This complements the €19 million project, Iliad, funded under the Green Deal Call for research proposals to pilot the DTO concept.

On 20 April 2022, more than 70 experts from 20 countries across Europe came. together in Paris to develop a common vision for a European DTO and agreements or how to move forward together to meet this transformational challenge

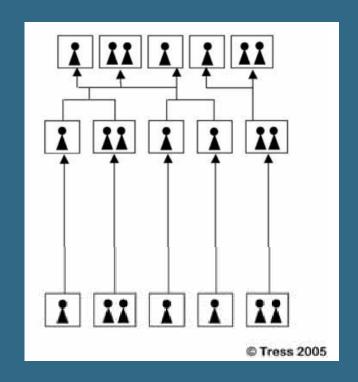

EUROPEAN DIGITAL OCEAN FORUM - 20TH AND 21ST APRIL 2022 1

Ocean integration: why is it challenging?

Ocean observing suffer from organisational silos because:

- Research-based system, driven by discovery and understanding
- Discipline/platform-oriented organization
- Disparate landscape
- Fragmented governance, with weak leadership
- Hypercompetitive culture, driven by scientific "excellence"
- Unpredictable funding

Ocean integration: why is it challenging?

Ocean integration requires to transcend the traditional silos of expertise

Photo by: libertygal/Getty Images

A challenge in many transdisciplinary research areas... and also in the private sector and economy!

Ocean integration: why is it challenging?

The silos of expertise = a problem in many transdisciplinary research areas...

...and also in the private sector!

Common solutions for connecting silos:

- I. Define a common goal
- 2. Have a strong leadership
- 3. Stimulate high-level interpersonal skills
- 4. Remove internal competitiveness
- 5. Redesign the organizational structure

Photo by: libertygal/Getty Images

Ocean integration: a call for transformative changes

Ocean integration could be achieved through:

Building a mission-based organisation

- → Redesigning a robust governance structure
- → Agreeing on a common agenda & principles
- → Establishing clear design & implementation plan

Reaching sustainability

- Elaborating sustainable funding strategies
- Efficiently communicating the value of ocean observing
- Facilitating the transition from research to operations

Promoting a culture shift

- → Connecting the diverse communities
- → Fostering FAIR data and best practices
- → Redefining scientific "excellence"
