TAKING THE PULSE
OF OUR PLANET FROM SPACE

The UNCCD puts Earth observation in action for LDN monitoring and reporting

Barron Joseph Orr, Sara Minelli, Brian O'Conner (UNCCD) and Neil Sims (CSIRO)

United Nations
Convention to Combat
Desertification

United for land

24 May 2022

ESA UNCLASSIFIED – For ESA Official Use Only

How significant is land degradation?

- Over **70%** of ice-free **terrestrial ecosystems** have been **transformed from their natural state for human use**.
- Governments have reported that **1 in 5 of those hectares** is no longer productive, undermining the well-being of **3.2 billion people**
- If business as usual continues through 2050, GLO2 **projects the further degradation of 16 million square km** – an area the size of South America.
- **Land is limited**, and will be needed for many necessary, but competing demands: food, water, energy, climate, biodiversity and much more

Successfully addressing the Sustainable Development Goals requires simultaneously halting and reversing land degradation.

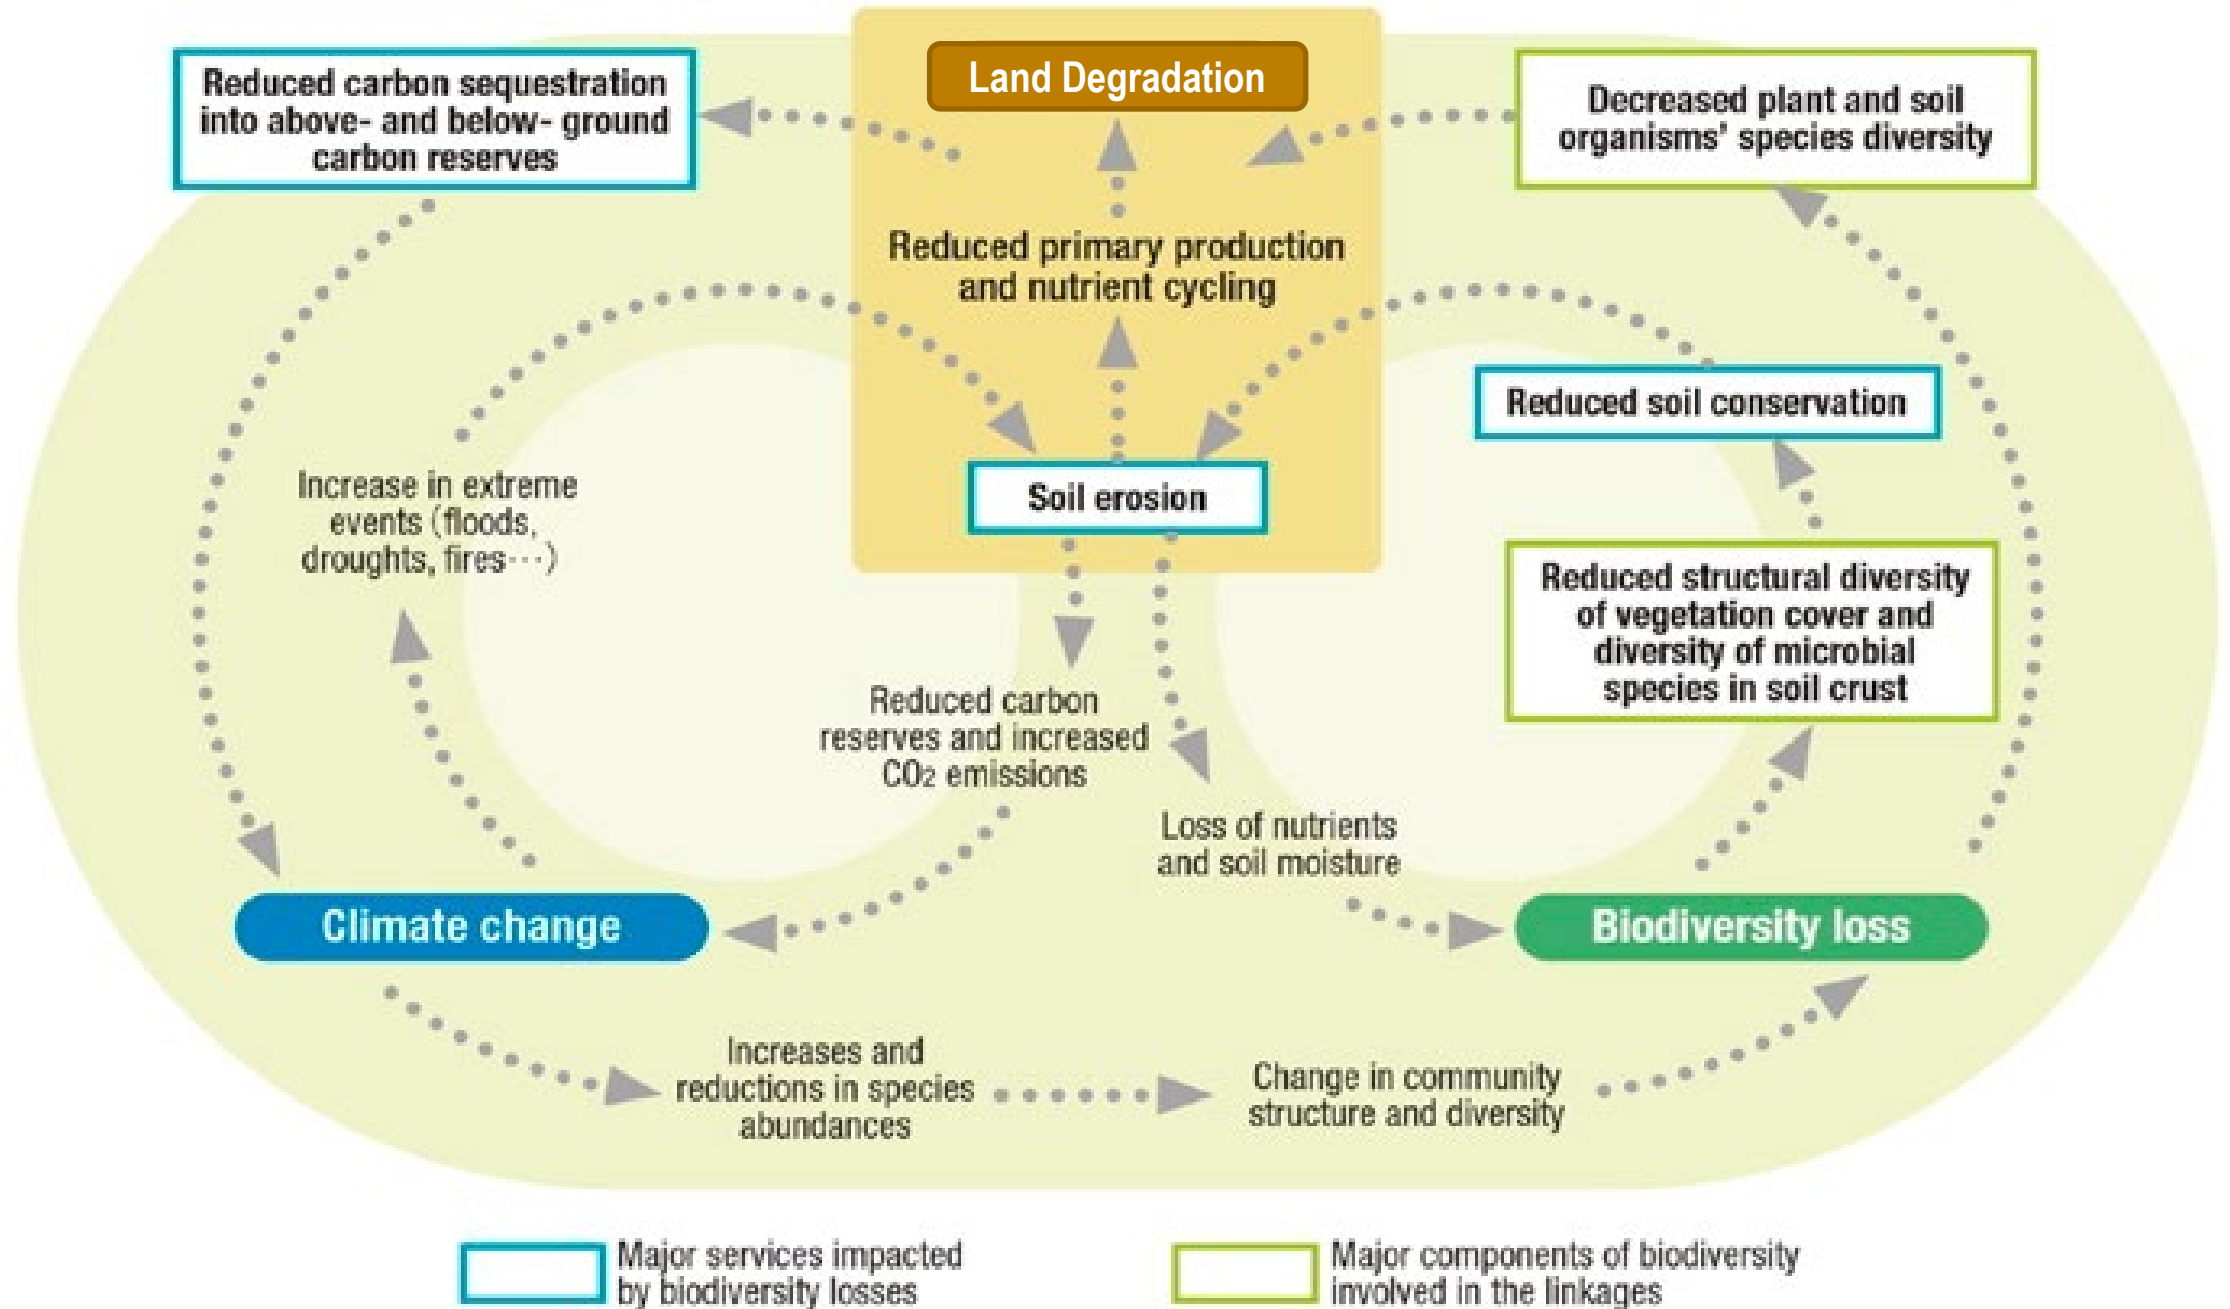

United Nations
Convention to Combat
Desertification

Agriculture &
Food Systems

The good news is land can accelerate the other SDGs

Example of SDG Synergies

Source: Millennium Ecosystem Assessment 2005 *Ecosystems and Human Well-being: Desertification Synthesis*. Redrawn by Ministry of the Environment, Japan

Synergies are good. But the bad news is...

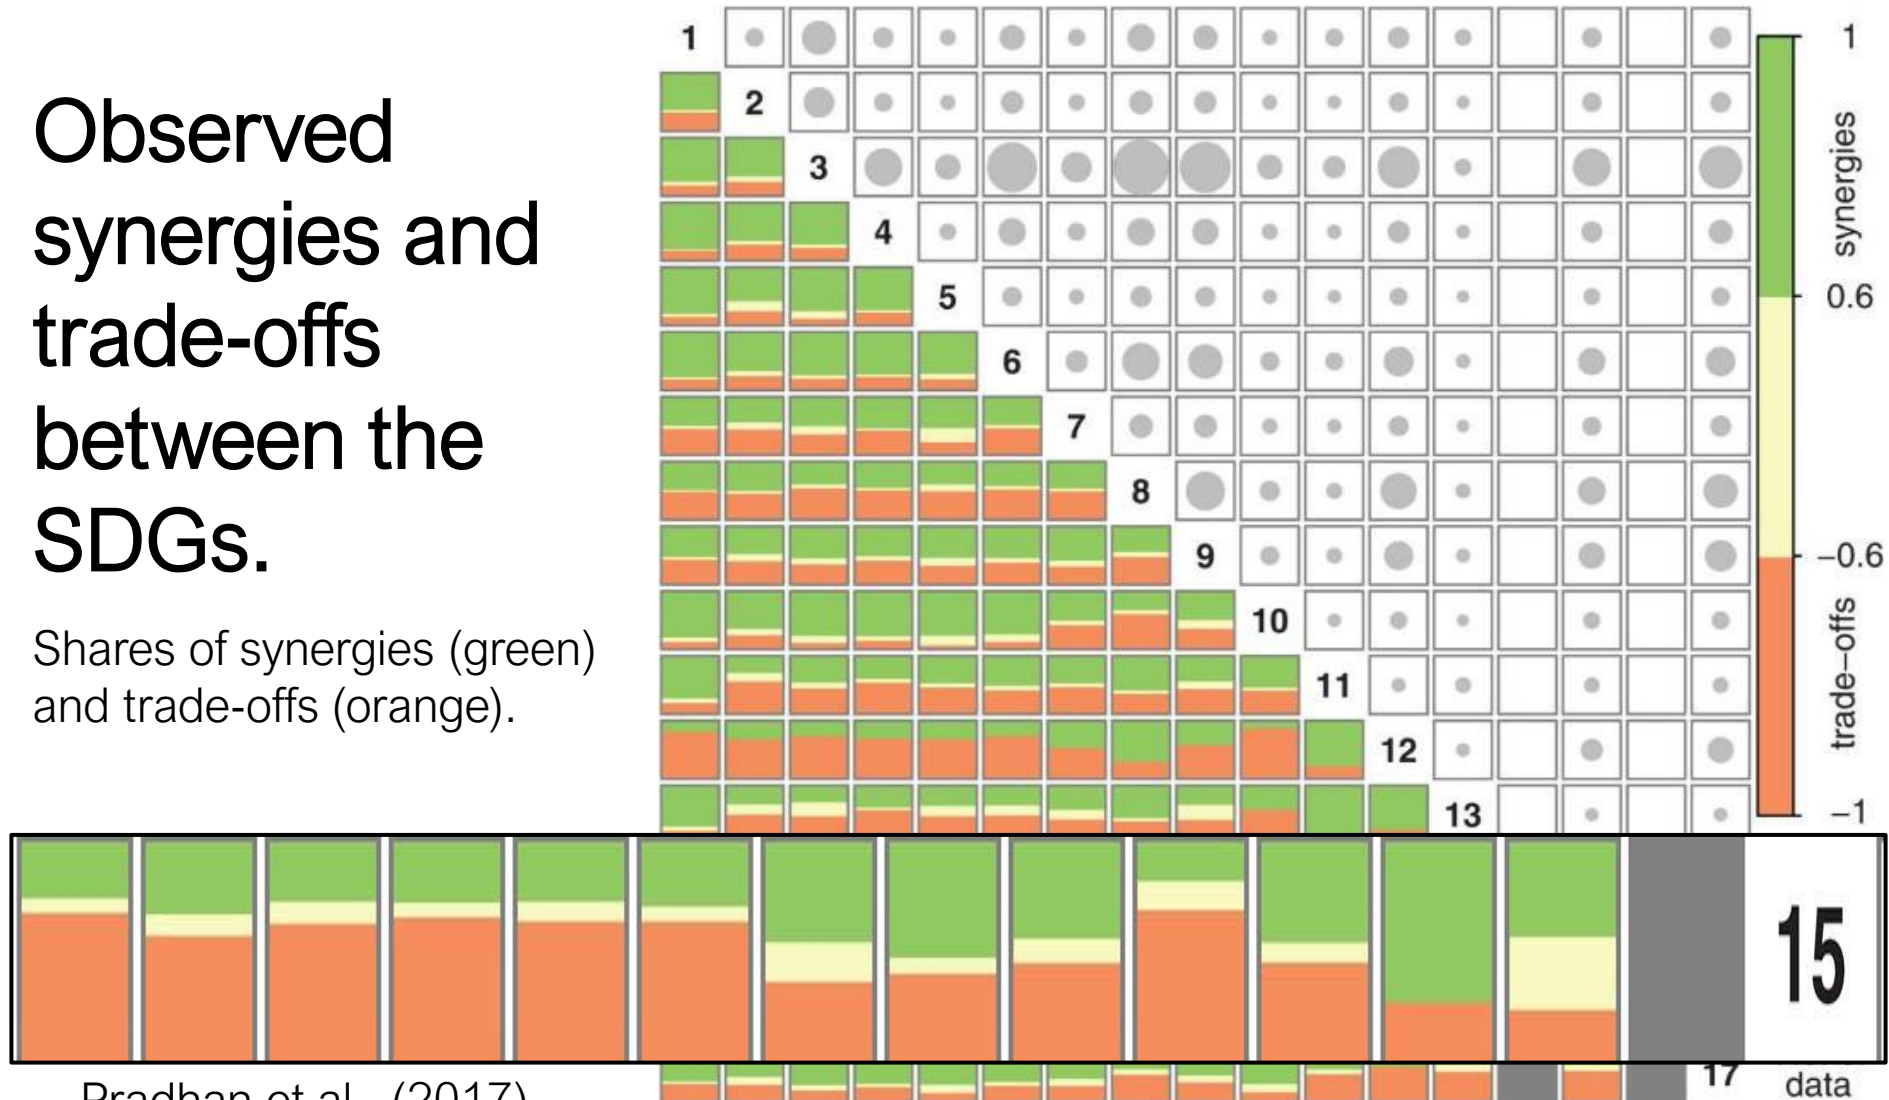

...SDGs *also* compete for the same land resources.

Synergies and trade-offs

Observed synergies and trade-offs between the SDGs.

Shares of synergies (green) and trade-offs (orange).

Pradhan et al. (2017)

Source: Figure 2 doi:10.1002/2017EF000632

The top synergies among SDGs are not surprising

Pradhan et al. (2017)

Source: Figure 3 doi:10.1002/2017EF000632

...and the top trade-offs should not be surprising either

Pradhan et al. (2017)

Ranks Top 10 trade-off pairs

Ranks Top 10 trade-off pairs

Source: Figure 3 doi:10.1002/2017EF000632

How can we navigate the inevitable SDG trade-offs?

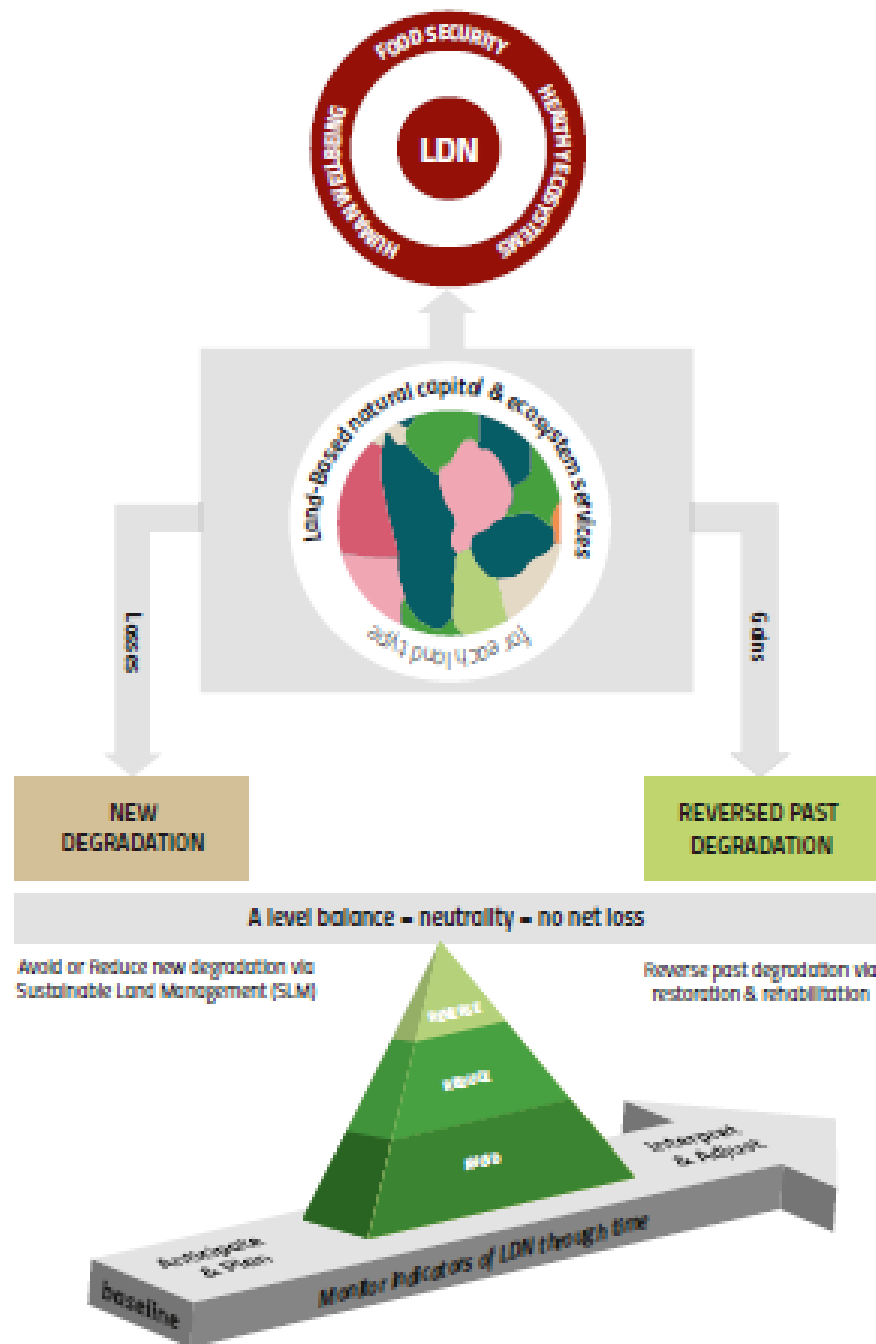

A balanced approach is needed.

- One that **anticipates new degradation** even as we plan to reverse past degradation
- One that **considers tradeoffs** among competing interests across the landscape

LDN provides the framework for this.

Land Degradation Neutrality (LDN)

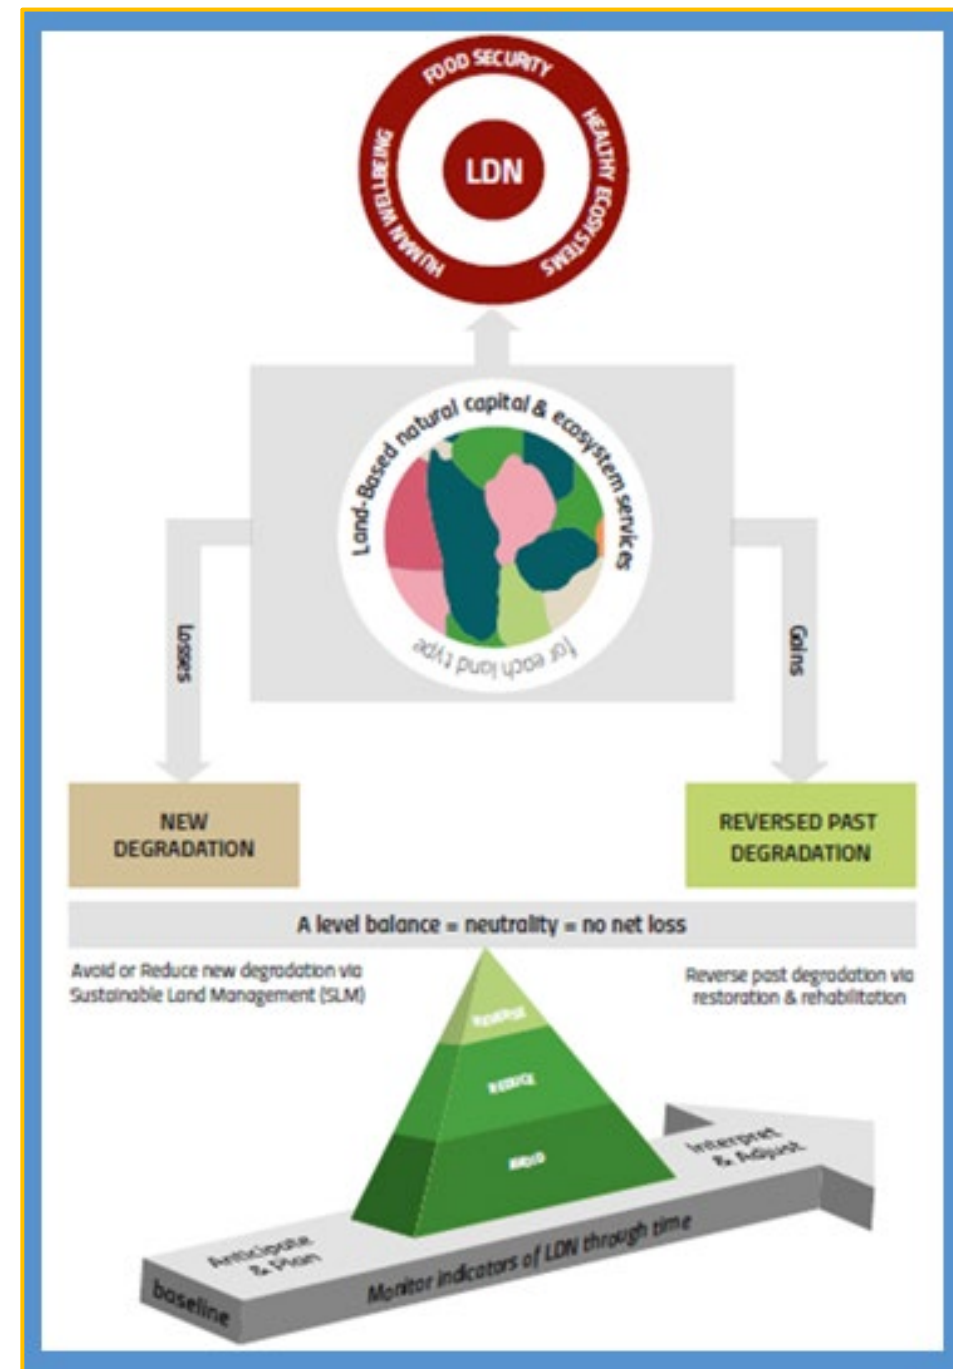

“A state whereby the amount and quality of land resources necessary to support ecosystem functions and services and enhance food security remain stable or increase within specified temporal and spatial scales and ecosystems”

UNCCD COP12 October 2015

Land Degradation Neutrality

- LDN seeks to **maintain natural capital** and the **ecosystem services** that flow from it;
- LDN is about keeping **land in balance**;
- Keeping land in balance provides the basis for **keeping food, water, carbon and biodiversity in balance** as well;
- LDN is about achieving **multiple benefits**;
- LDN provides a framework with **multiple entry points** which facilitate **optimizing the synergies** among the Rio Conventions (Climate Change, Biodiversity, Land Degradation).

United Nations
Convention to Combat
Desertification

Integrated land use planning

LDN planning (from target setting to territorial / spatial planning to integrated landscape management) involves anticipating where degradation is likely and modelling the tradeoffs among competing demands on land resources, location by location, so that the optimal mix of interventions across the landscape to achieve neutrality can be pursued.

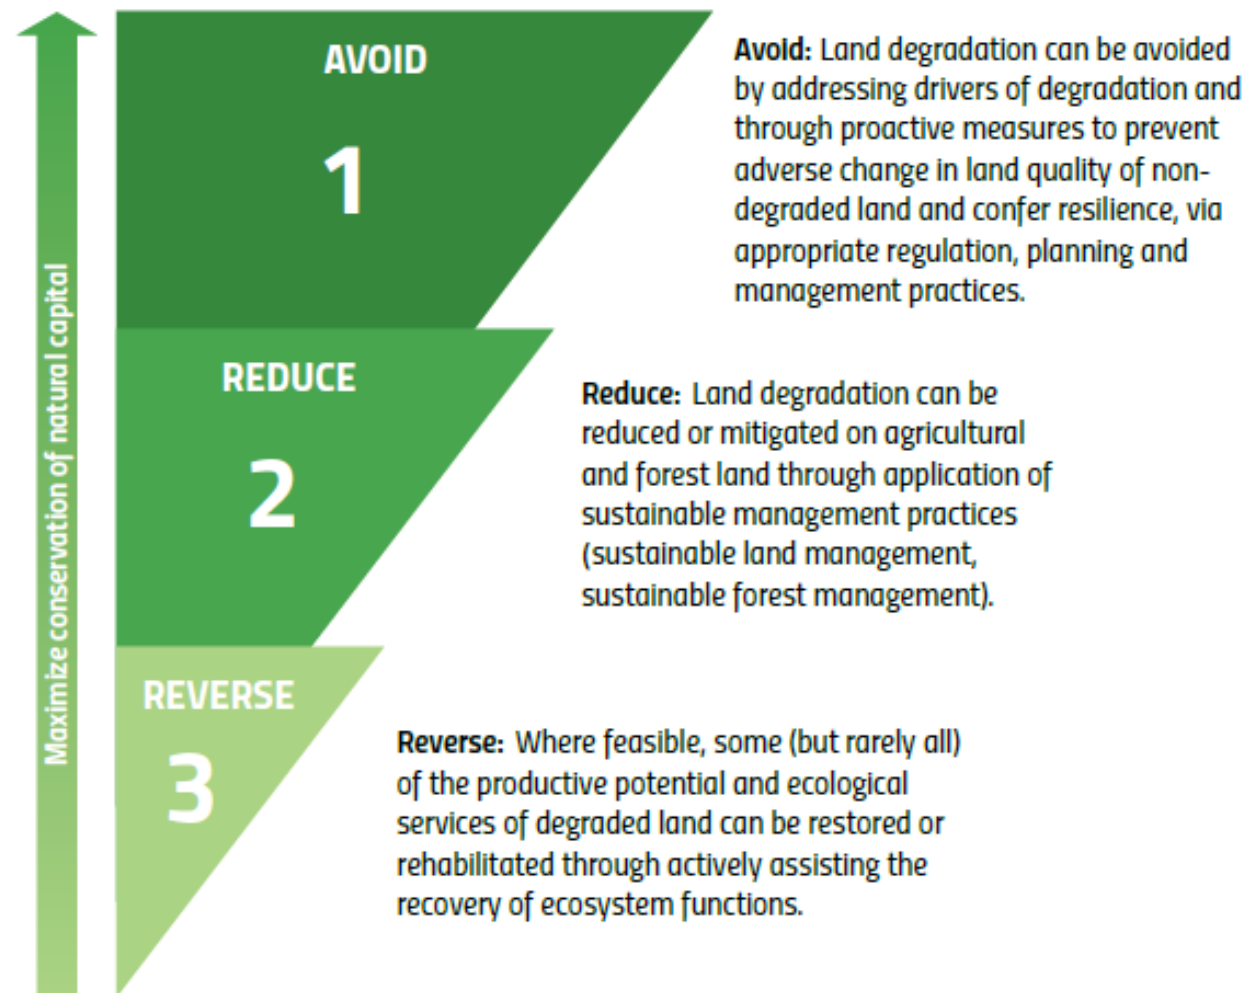

The background is a complex mosaic of irregular, multi-colored polygons in shades of green, purple, blue, yellow, orange, and brown. A white rectangular box is centered horizontally and vertically, containing black text.

Land Degradation Neutrality is about
doing the **right things** in the **right**
places at the **right scale**

Response Hierarchy

Prevention is better than cure

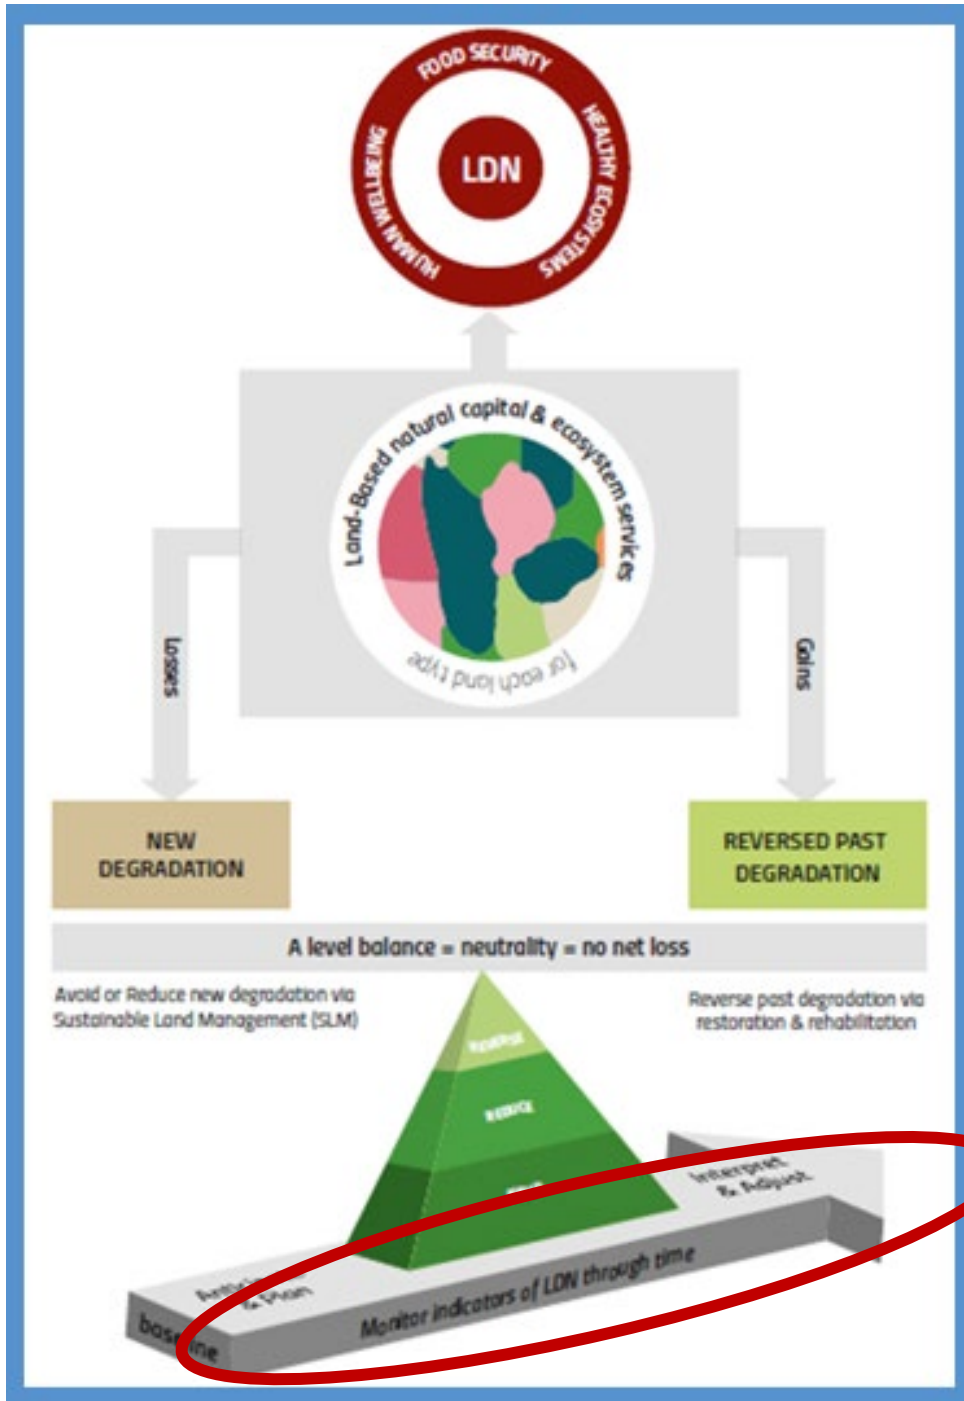

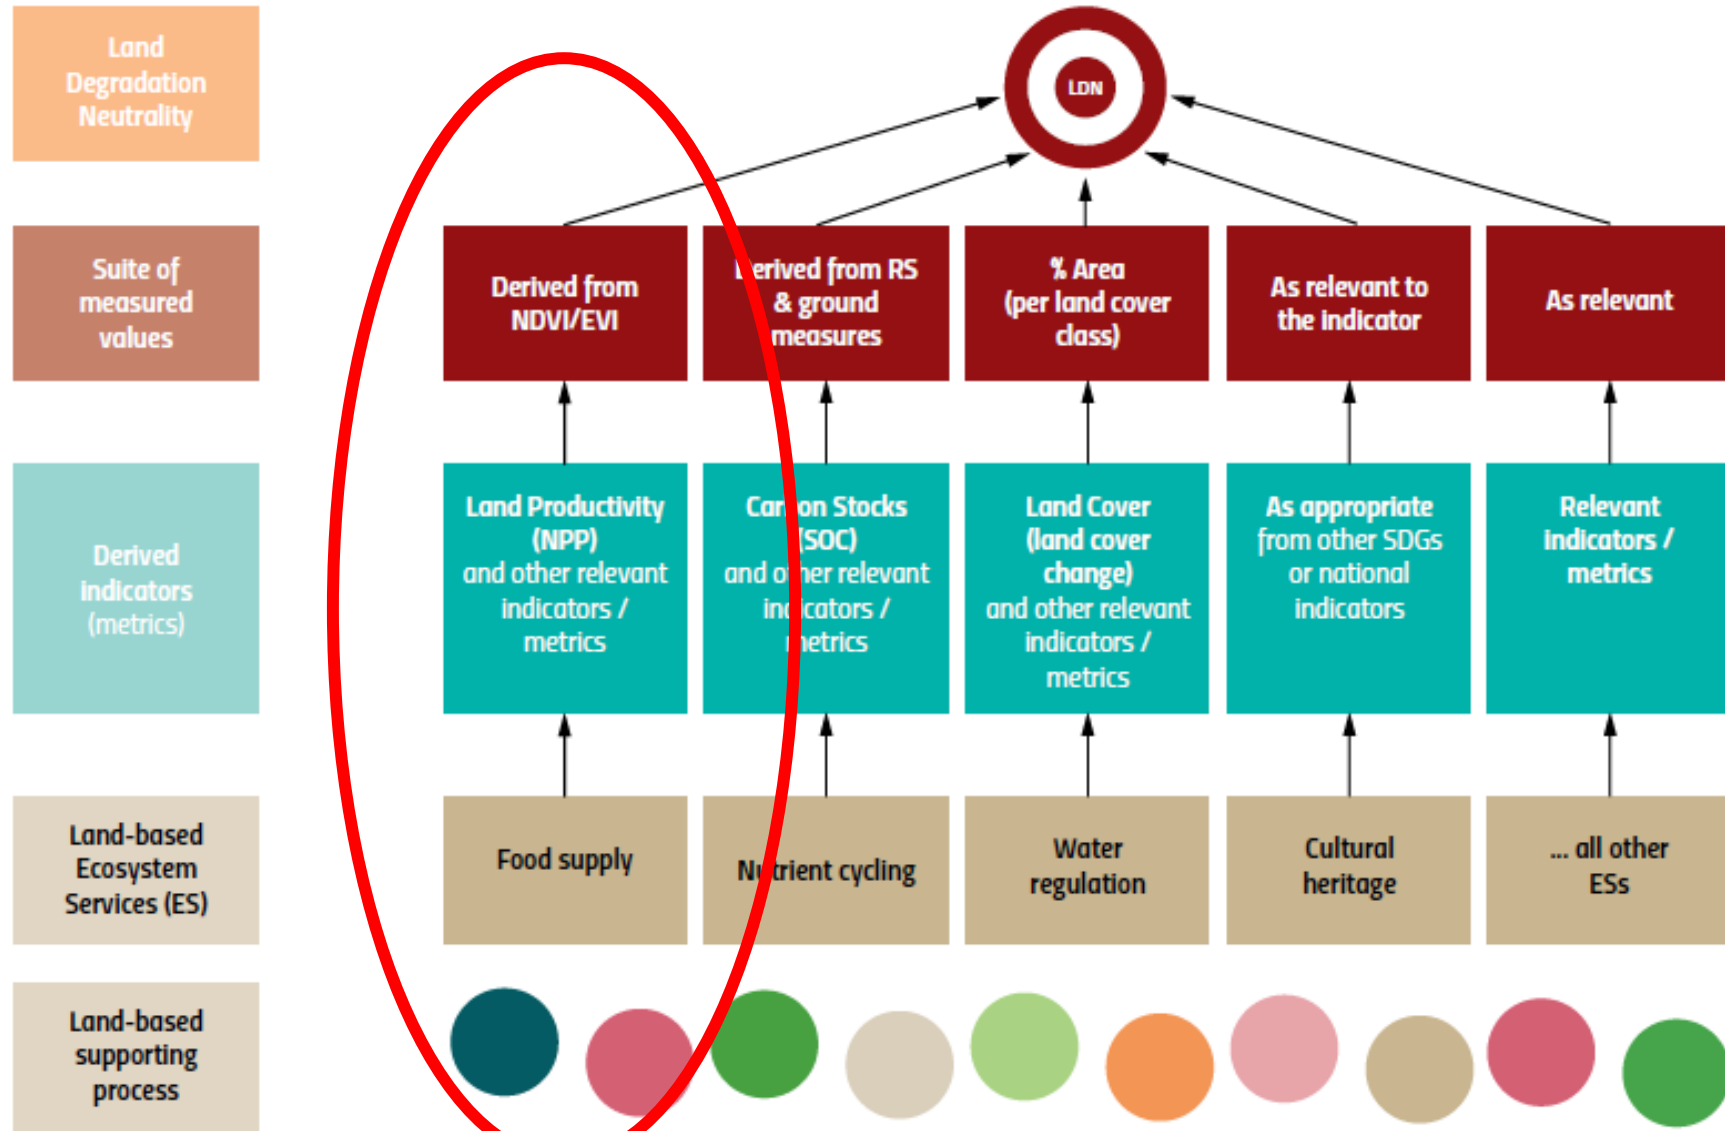

United Nations
Convention to Combat
Desertification

Monitoring and learning

- Global indicators: Land cover, land productivity and soil organic carbon
- “One out, all out”, area basis
- Complemented by:
 - Locally-relevant indicators
 - Process indicators
 - Outcome indicators
- Verified using local knowledge (multi-stakeholder platforms nested across scales)

Selection of indicators based on ecosystem functions that provide ecosystem services

The LDN framework does not prescribe how to measure the indicators.

It recommends effort to achieve consensus on **common criteria** and **standards** to harmonize application.

Monitor indicators relative to the baseline

The combination = SDG indicator 15.3.1

SDG Target 15.3:

“By 2030, combat desertification, restore degraded land and soil, including land affected by desertification, drought and floods, and strive to achieve a land-degradation neutral world”

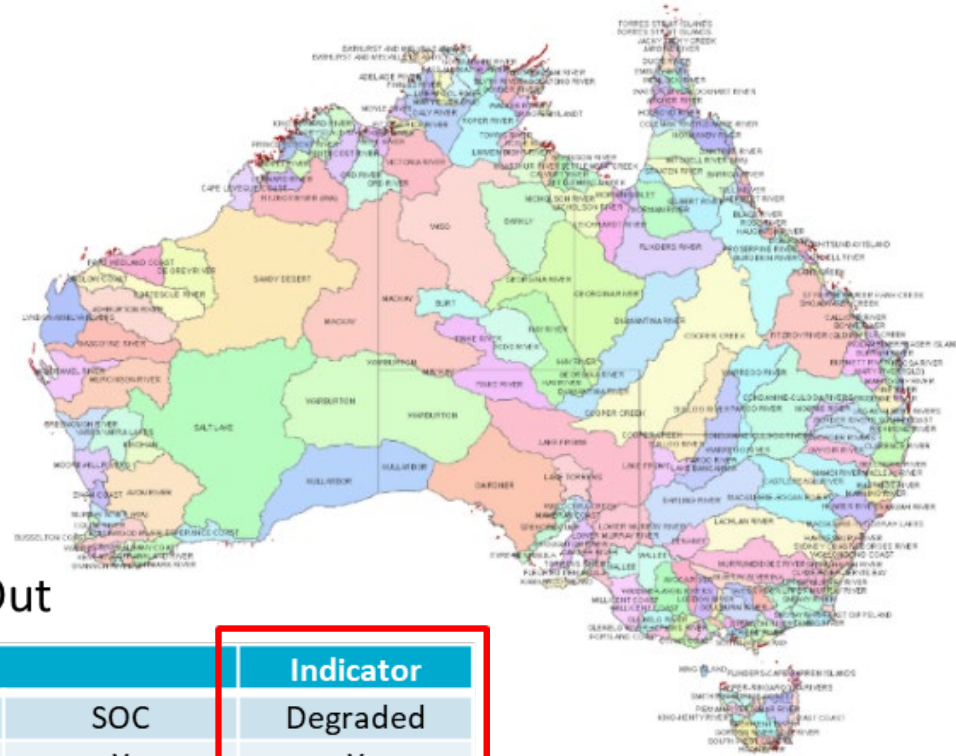

SDG Indicator 15.3.1:

Proportion of land that is degraded over total land area.

Calculating SDG 15.3.1

- One-Out-All-Out
- Aggregation
- Accuracy assessment

One-Out-All-Out

Support Class	Sub indicator			Indicator
	Land cover	Productivity	SOC	Degraded
1	Y	Y	Y	Y
2	Y	Y	N	Y
3	Y	N	Y	Y
4	Y	N	N	Y
5	N	Y	Y	Y
6	N	Y	N	Y
7	N	N	Y	Y
8	N	N	N	N

How do we move from “choosing the best data set or tool” to mobilizing the entire Earth observation community to help?

Engage a multilateral process which is designed to do just this:

The Group on Earth Observations

How do we move from “choosing the best data set or tool” to mobilizing the entire Earth observation community to help?

**LAND
DEGRADATION
NEUTRALITY**

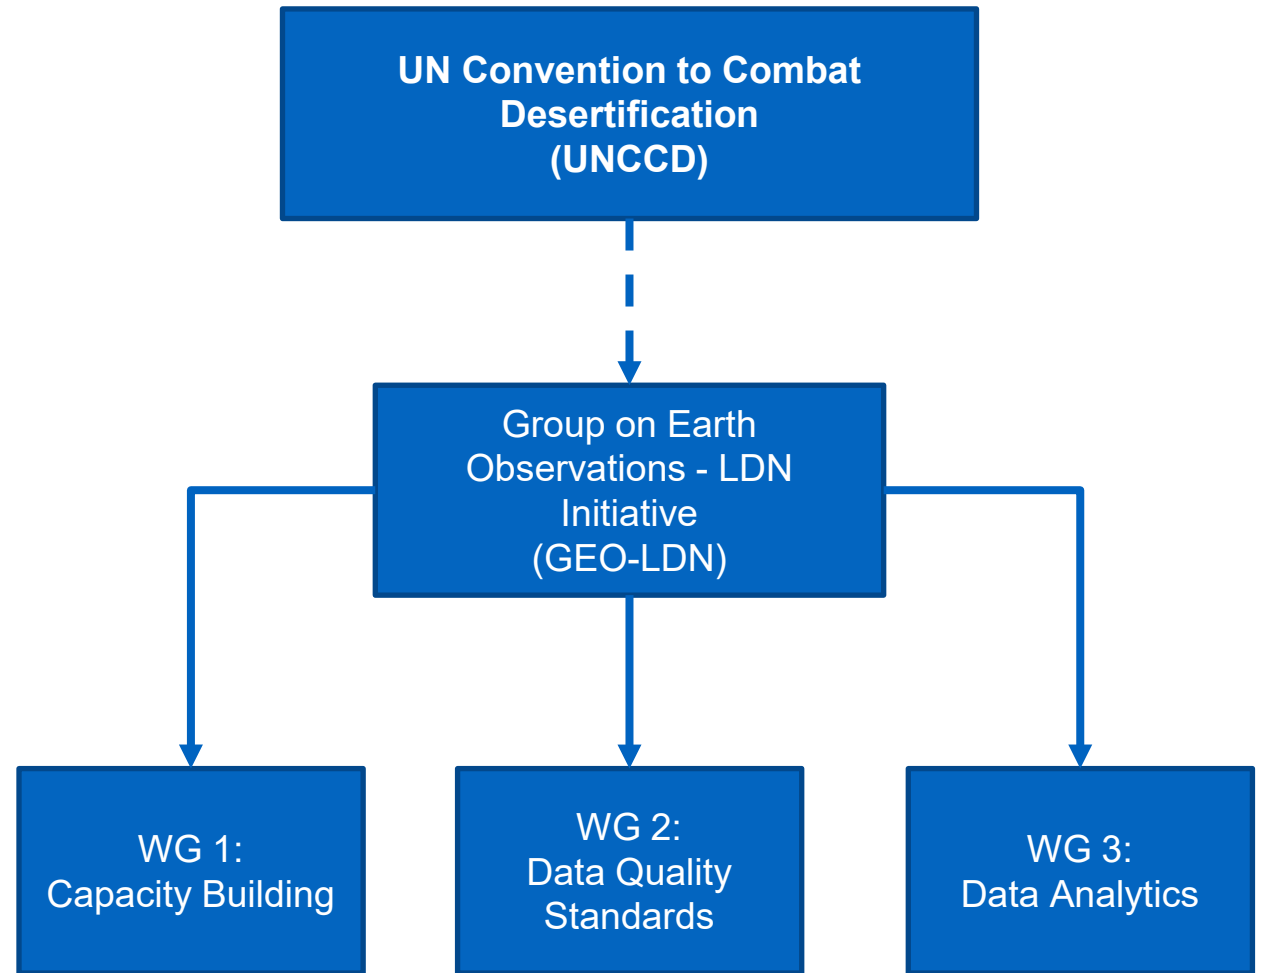

LAND DEGRADATION NEUTRALITY

- ...is a unique **stakeholder-driven initiative** with a clear policy mandate from UNCCD
- ...helps national and local actors in all countries **use Earth observations to achieve LDN.**
- ... promotes and supports the collaborative development, provision and use of EO datasets, quality standards, analytical tools and capacity building

For more info:

http://earthobservations.org/geo_ldn.php

Mandate for the UNCCD approach to monitoring

(from decisions 22/COP.11 and 11/COP.14)

Requests the secretariat to **provide** affected country **Parties with national estimates** of each respective metric of a **minimum set** of progress indicators **based on available data sources**

and

urges affected country **Parties to subsequently verify or replace** these national estimates using data sourced/computed nationally/locally

The EO community has embraced standards so that all data providers can support countries

Minimum data quality standards and decision trees for SDG Indicator 15.3.1: Proportion of land that is degraded over total land area. Technical note.

Version: 1.0
Date: June 2020

**LAND DEGRADATION
NEUTRALITY INITIATIVE**

Harmonized analytical methods

- The Good Practice Guidance (GPG) provides the analytical methods for calculating SDG Indicator 15.3.1 using Earth observation data
- Includes guidance the three sub-indicators, which are trends in land cover, land productivity and soil organic carbon stocks.
- Reflects current best practice, data and knowledge
- This guidance supports implementation of the Tier I methods for Indicator 15.3.1 adopted by the UN Statistical Commission

<https://www.unccd.int/resources/manuals-and-guides/good-practice-guidance-sdg-indicator-1531-proportion-land-degraded>

“National ownership” is about empowering countries to evaluate data sets, analyze data, and transform data according to the Good Practice Guidance

United Nations
Convention to Combat
Desertification

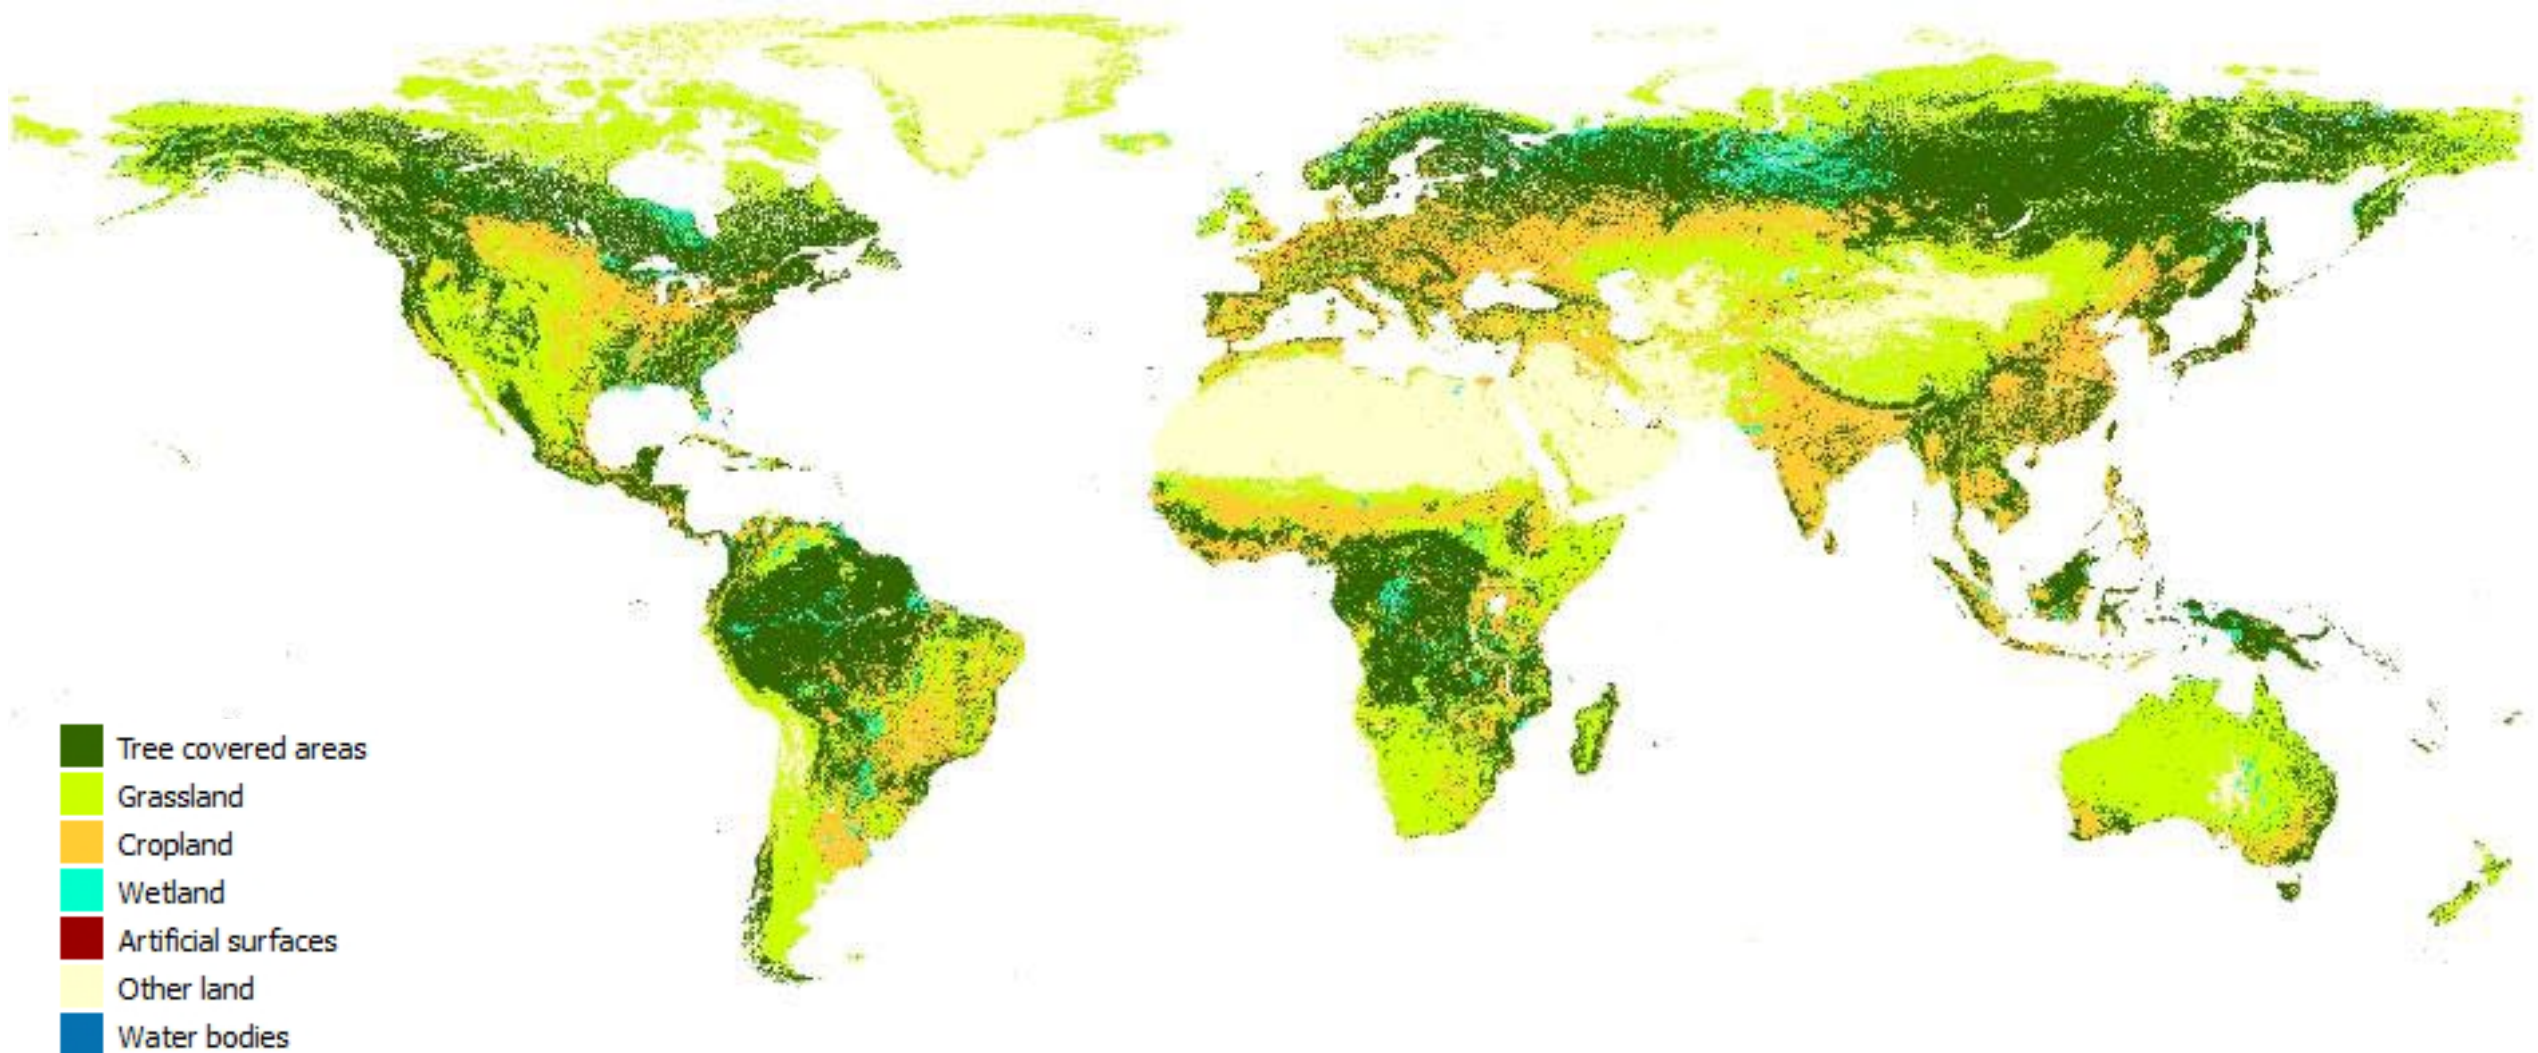

What do we measure?

Three essential
land degradation indicators
are measured in all
countries.

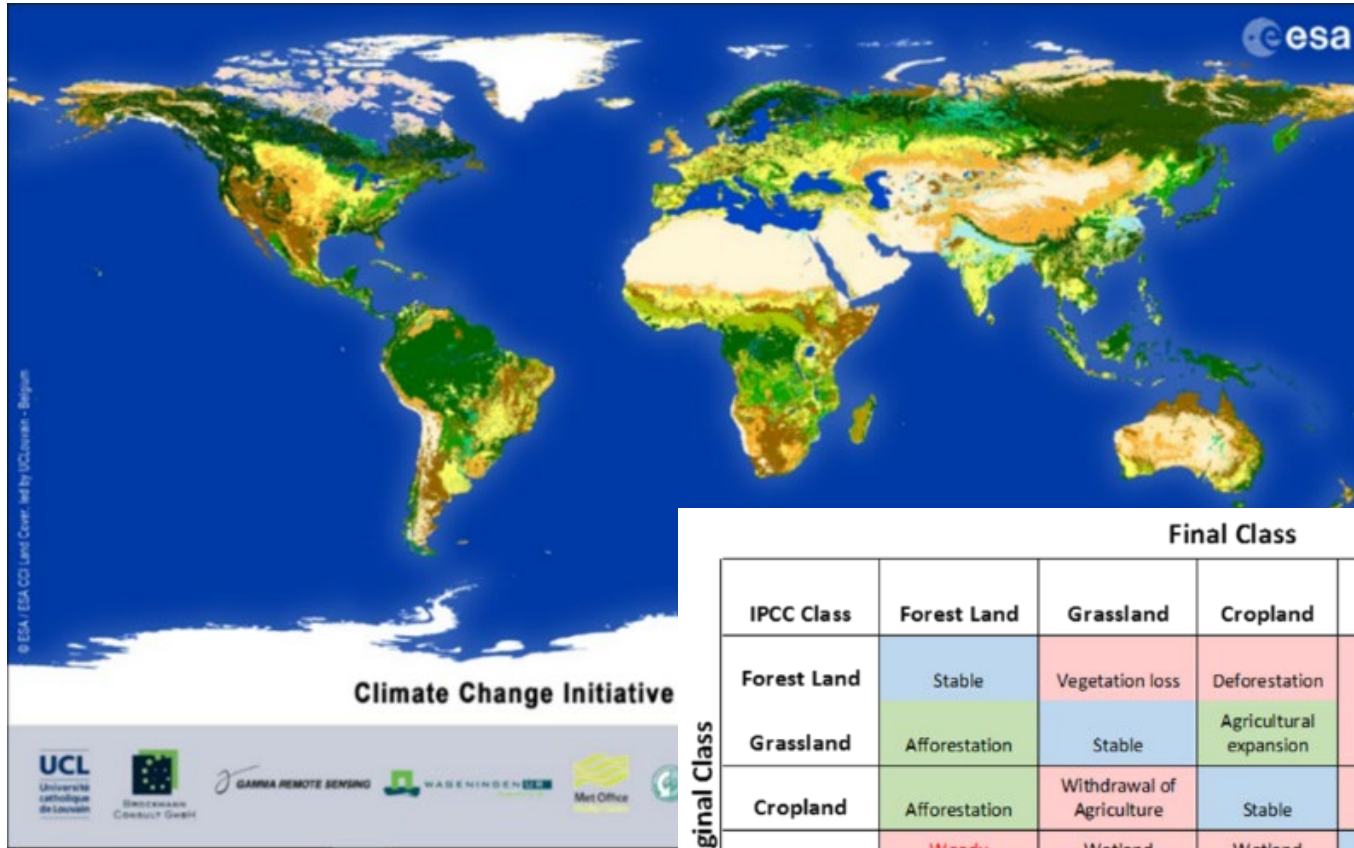

Countries also measure any
other relevant indicators

Trends in land cover change

Trends in land cover change

**An example only*

		Final Class					
IPCC Class		Forest Land	Grassland	Cropland	Wetlands	Settlements	Other Land
Forest Land	Stable	Vegetation loss	Deforestation	Inundation	Deforestation	Vegetation loss	
Grassland	Afforestation	Stable	Agricultural expansion	Inundation	Urban expansion	Vegetation loss	
Cropland	Afforestation	Withdrawal of Agriculture	Stable	Inundation	Urban expansion	Vegetation loss	
Wetlands	Woody Encroachment	Wetland drainage	Wetland drainage	Stable	Wetland drainage	Wetland drainage	
Settlements	Afforestation	Vegetation establishment	Agricultural expansion	Wetland establishment	Stable	Withdrawal of Settlements	
Other Land	Afforestation	Vegetation establishment	Agricultural expansion	Wetland establishment	Urban expansion	Stable	

Original Class

Land Cover – Assess Available Data

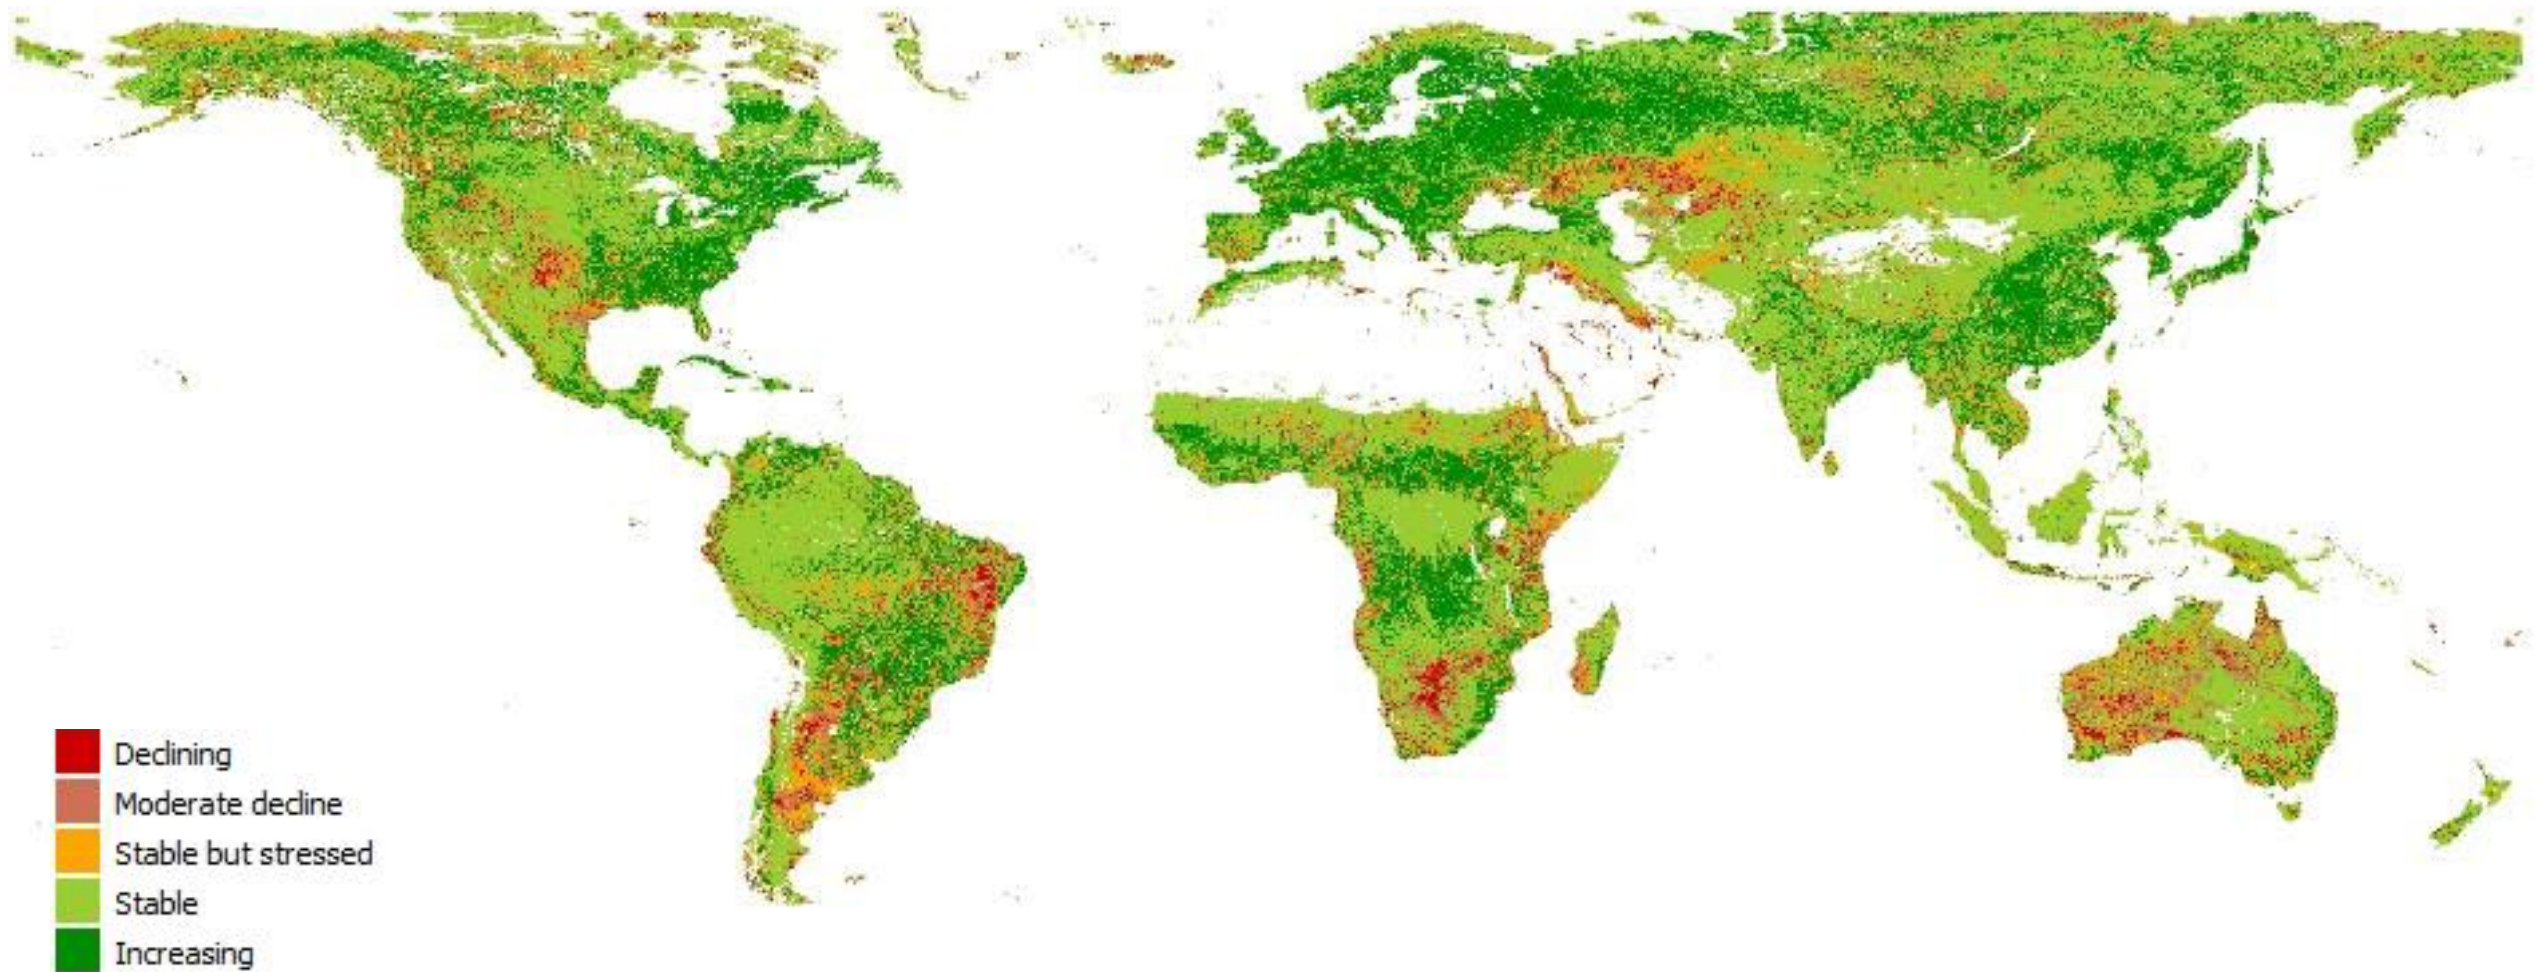

Figure 3-4.
Decision tree for determining the most appropriate data for calculation of the land cover change sub-indicator (GEO-LDN Initiative 2020)

Key Criteria for Assessing LC Data

1. Legend definition:
2. Temporal range and frequency
3. Spatial coverage and resolution
4. Classification accuracy

Trends in land productivity

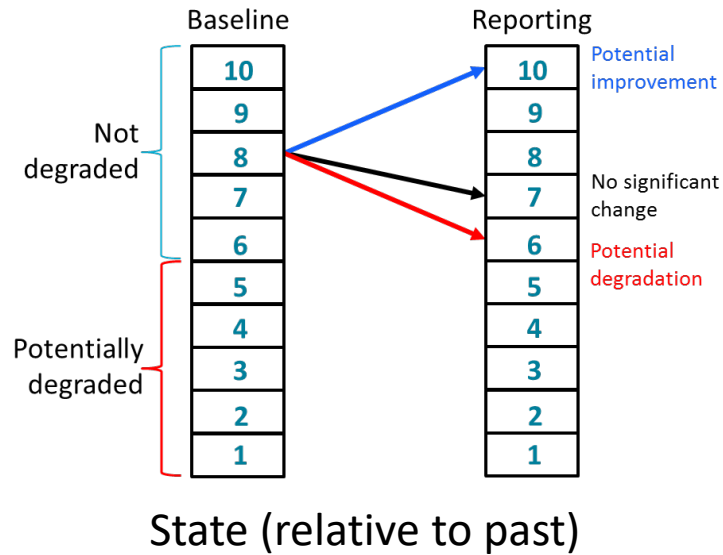

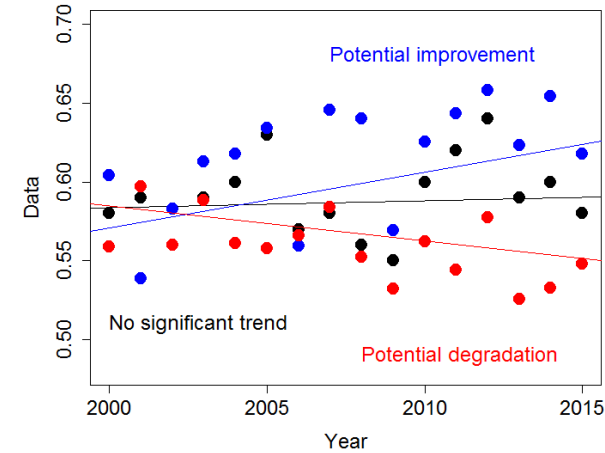

Trends in land productivity

Metrics correlated with ANPP (NDVI etc)

Trend (over time)

Performance (relative to other similar land capability units)

**water availability*

Land Productivity degradation dynamics

Figure 4-2

Stylised phases in the long-term average trend of land productivity. A declining trend of productivity, or productivity levels that remain below the long-term average, may indicate productivity degradation.

Trajectory and level

Land Productivity metrics

- **Trend**

- the trajectory of change in annual productivity over the long term per pixel

- **State**

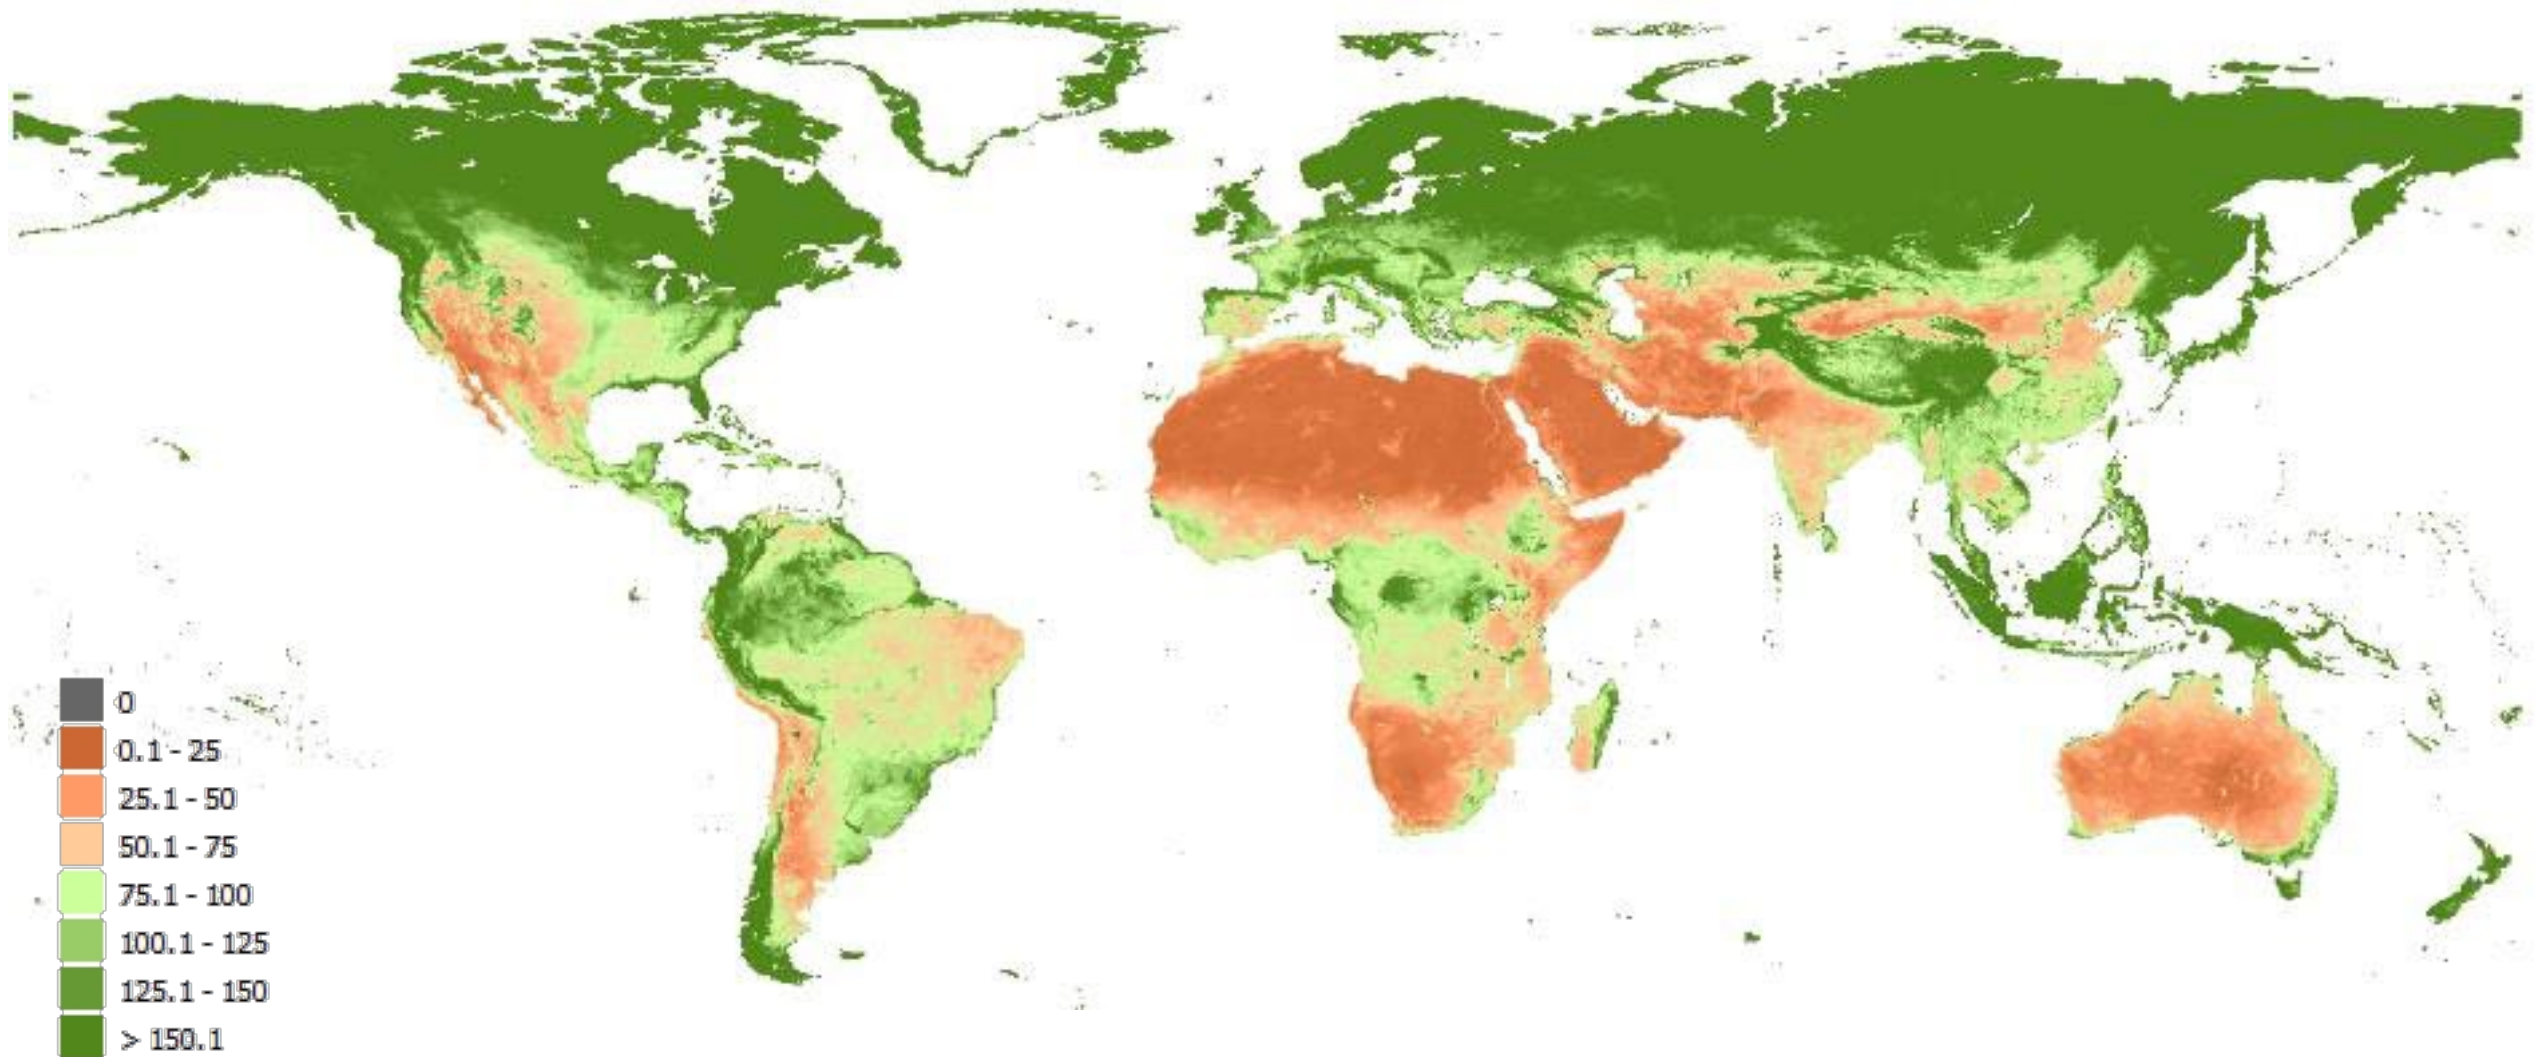

- compares the current to historical annual productivity per pixel

- **Performance**

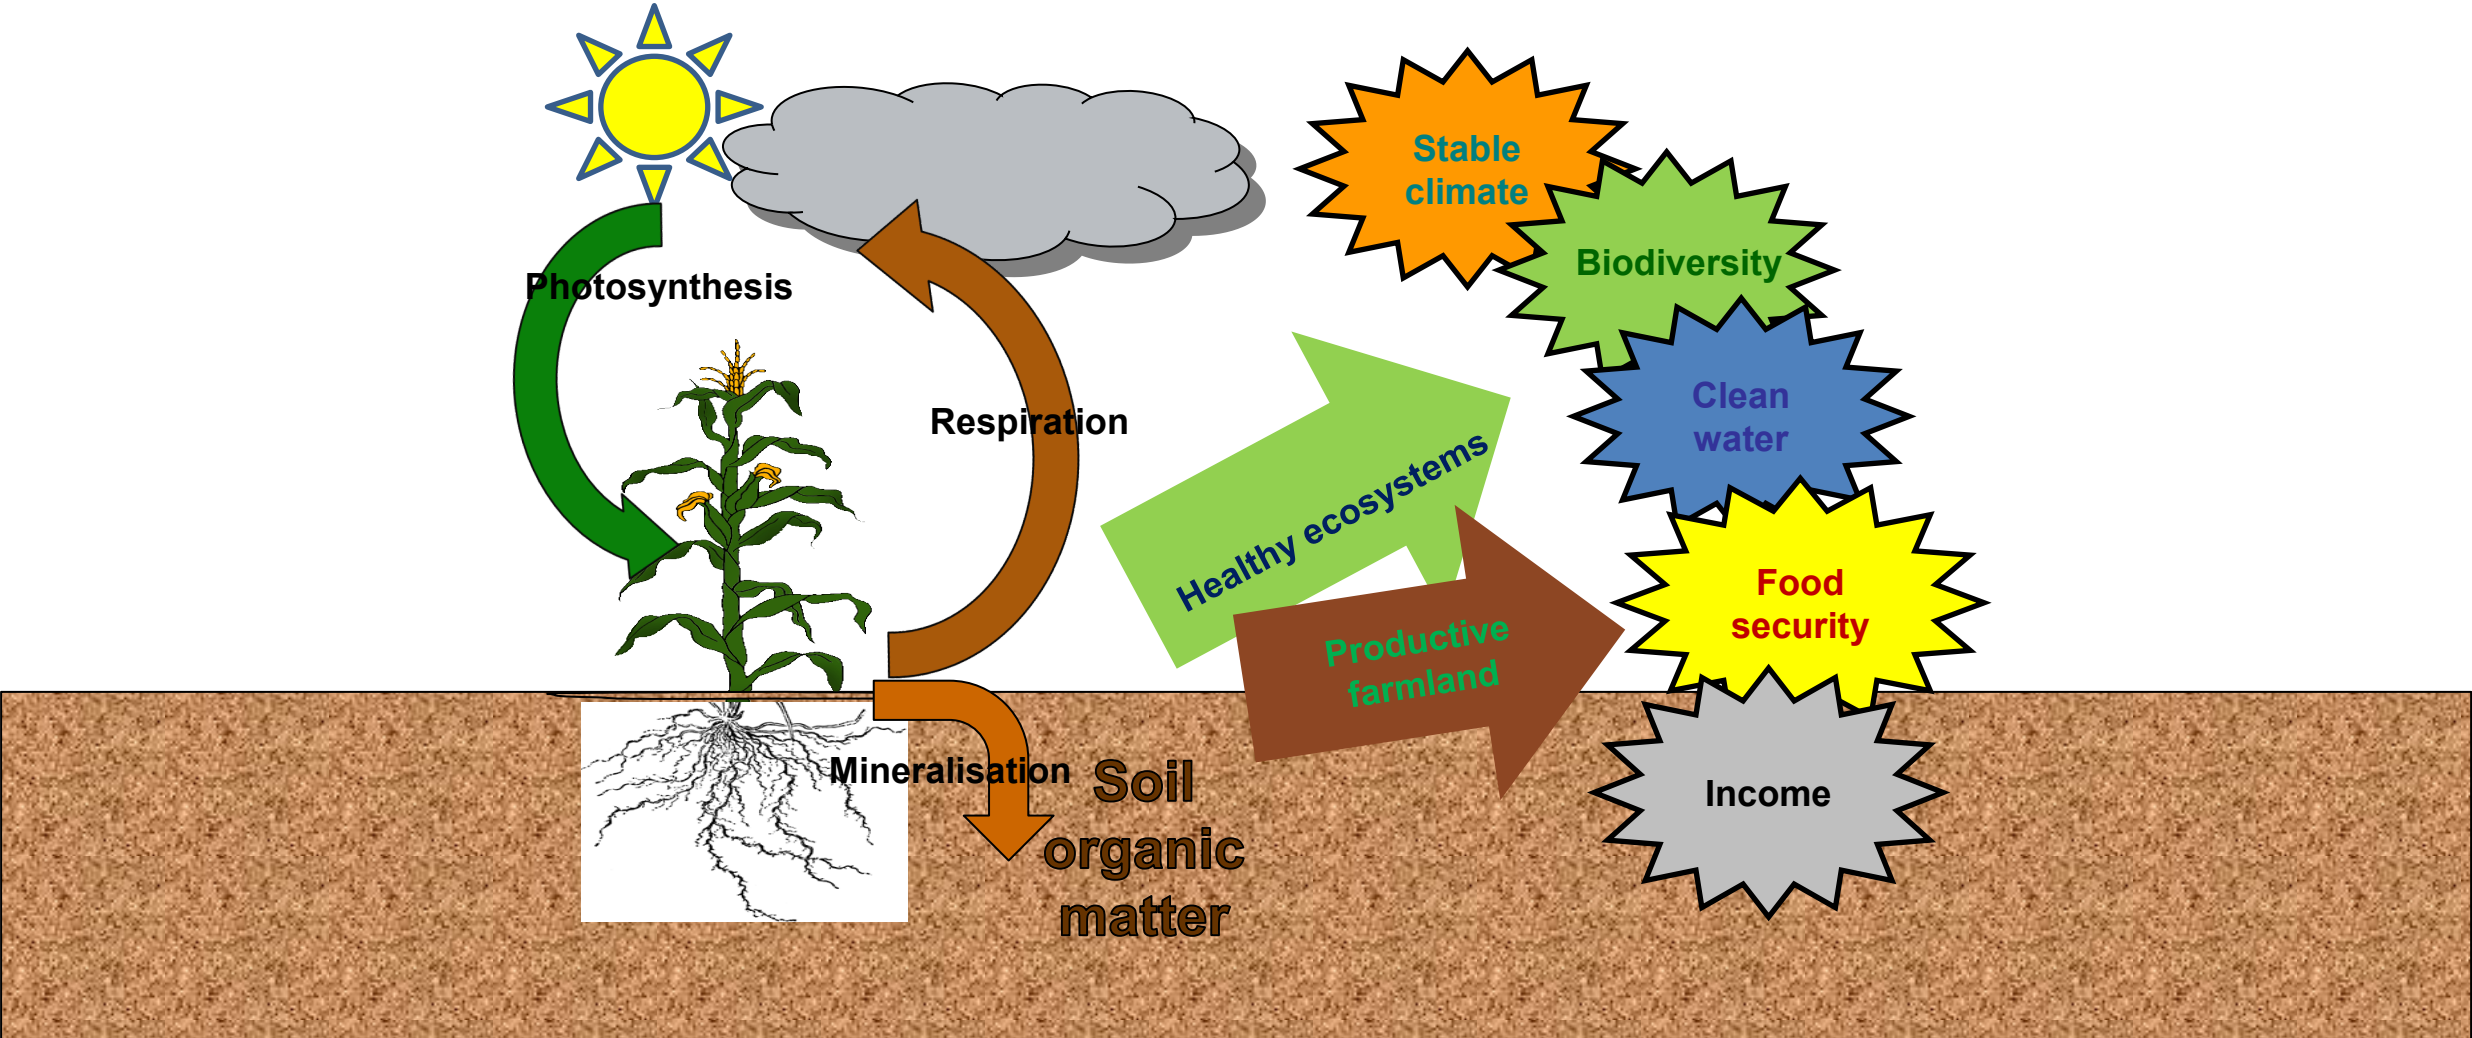

- Compares local annual productivity over an area with other areas with a similar land productivity potential (LCEU)

TREND-STATE-PERFORMANCE – COMBINE TO SHOW PRODUCTIVITY DEGRADATION

Trends in soil organic carbon

Slow ecological variable: Carbon stored as soil organic matter builds healthy soil and sustains humanity

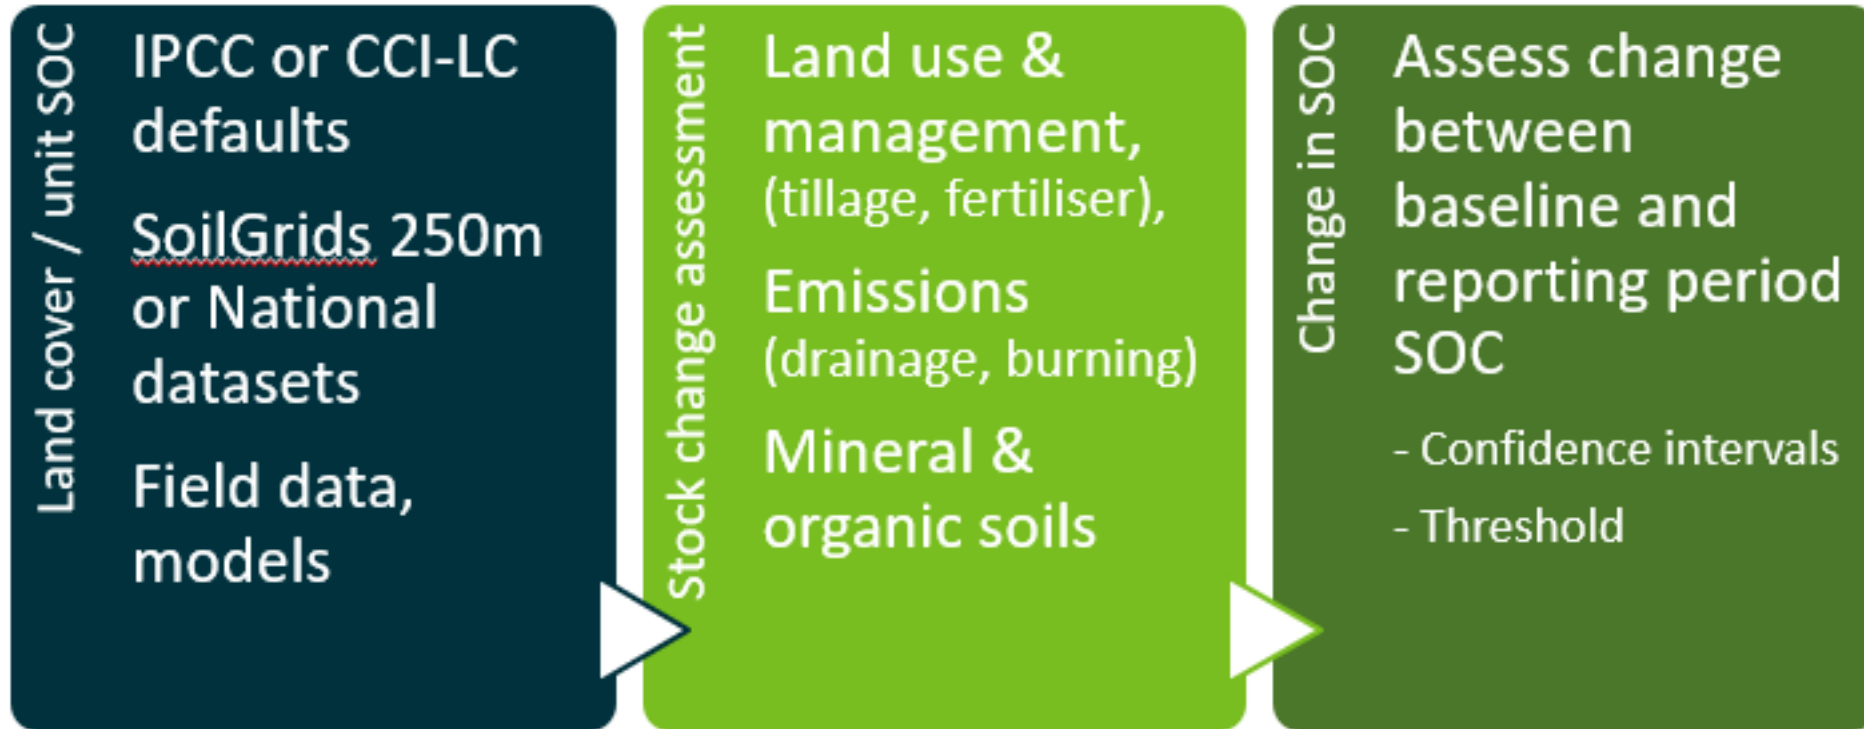

Carbon Stocks – Tiered Approach

- Consistent with IPCC guidelines, supplements & refinements (IPCC 2006; 2013; 2019)
- Tier 1: general methods with default values
- Tier 2: additional use of country-specific data
- Tier 3: more complex methods involving ground measurements & modelling
- It is good practice to use higher tiers for significant sources/sinks.

Decreasing uncertainty
↓
Increasing complexity

Trends in soil organic carbon stocks

8	N	N	N	N

TRENDS.EARTH

Trends.Earth is a **free and open-source** tool for monitoring indicators of land change, and in particular desertification, land degradation, and drought

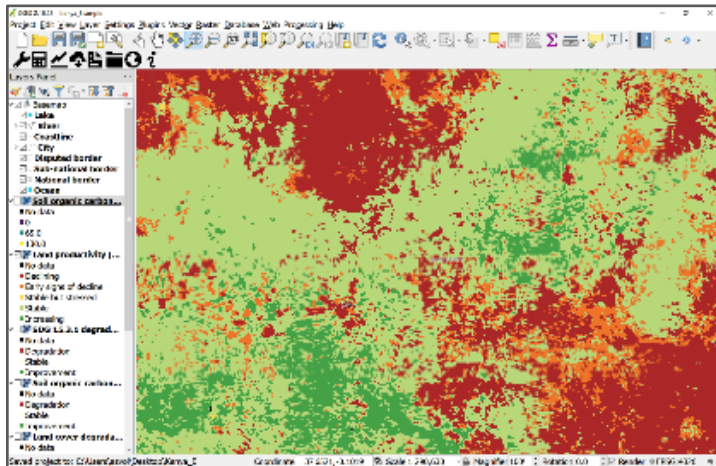

Trends.Earth Supports:

- Monitoring progress towards achieving SDG target 15.3 (land degradation neutrality) and 11.3 (sustainable cities)
- Local and cloud-based processing of data
- Summarizing data for reporting to UNCCD
- Integration of local data with global datasets
- Local ownership of data and analytical process

Coming soon:

- All new interface
- Direct support of reporting to UNCCD on Strategic Objectives 1, 2, and 3
- Higher resolution datasets
- Integration with LandPKS, WOCAT

<https://www.trends.earth>

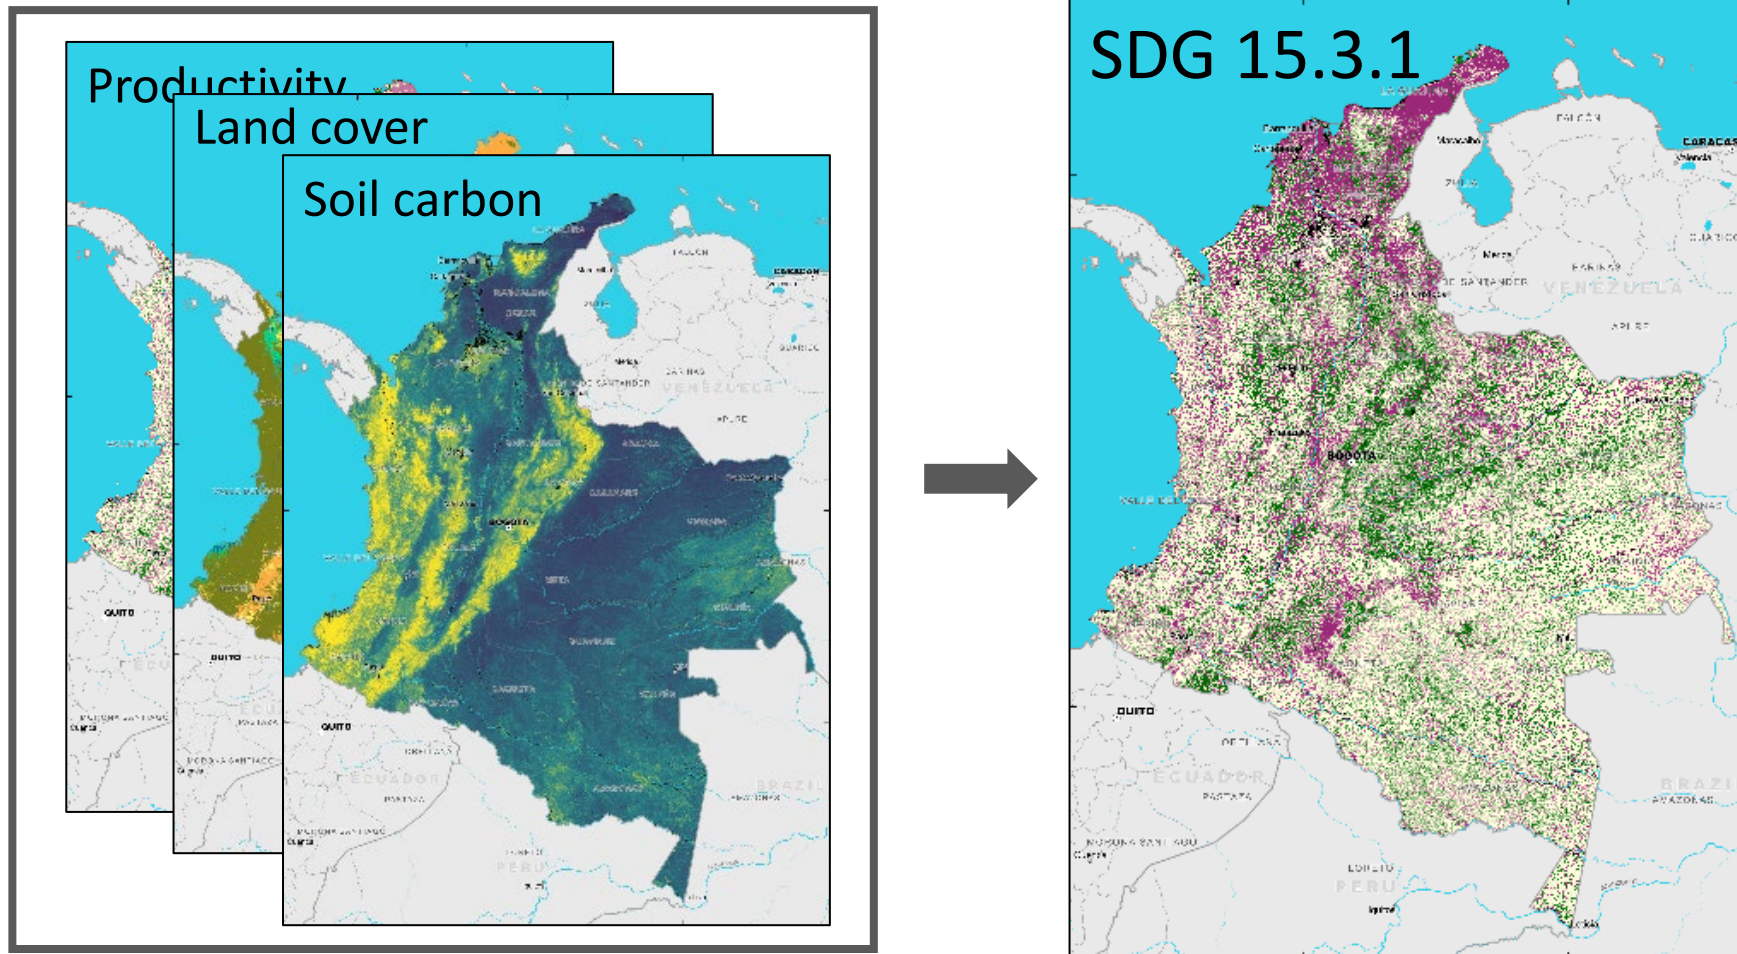

Trends.Earth productivity summary table				TRENDS.EARTH tracking land change					
Summary of change in productivity									
		Area (sq km)		Percent of total land area					
		Total land area	1,133,715.5	100.00%					
		Land area with improved productivity	16,414.5	1.44%					
		Land area with stable productivity	467,758.3	41.27%					
		Land area with degraded productivity	24,553.3	2.16%					
		Land area with no data on productivity	482,989.4	42.53%					
Area of land with improved productivity by type of land cover transition (sq. km)									
		Tree-covered area	Shrubland	Composites	Woodland	Arable lands	Other lands	Water bodies	Yield
Tree-covered area	85,748.23	275.26	168.71	2.28	1.25	0.25	0.03	1629.137	
Composites	2,236.07	12,812.04	224.23	1.43	11.24	0.16	0.03	122,716.04

[FAQ](#) | [Terms of use](#) | [Contact](#)

What was the outcome for SDG 15.3.1 reported by countries in 2019?

The proportion of degraded land for all land reported by country Parties is 20%, which amounts to over 18 million km².

Percent degraded land by country
