water vapour
cci

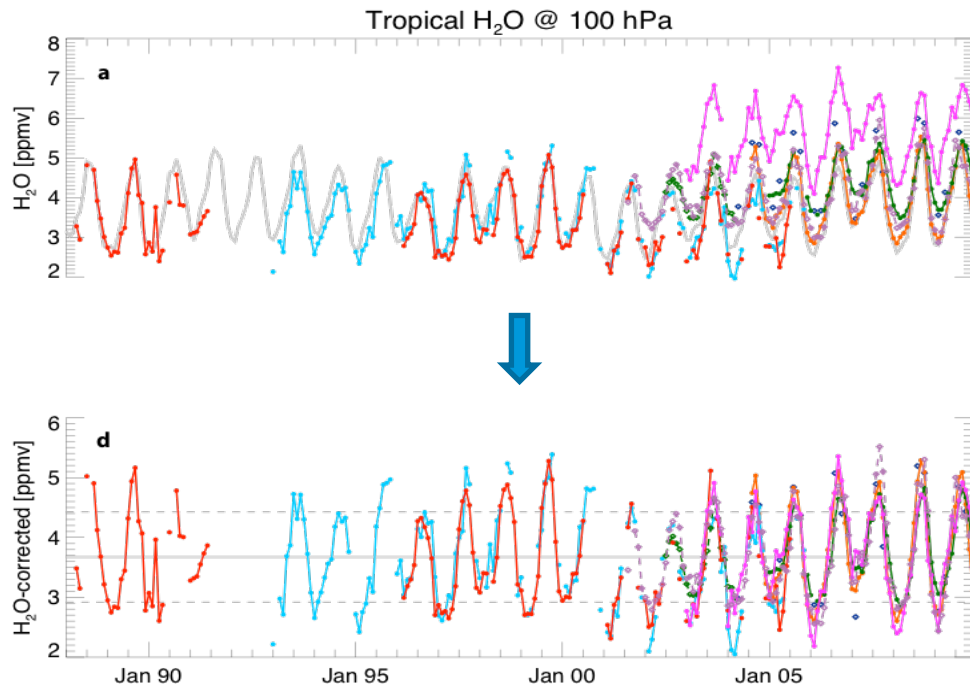

- Input sensors (limb)

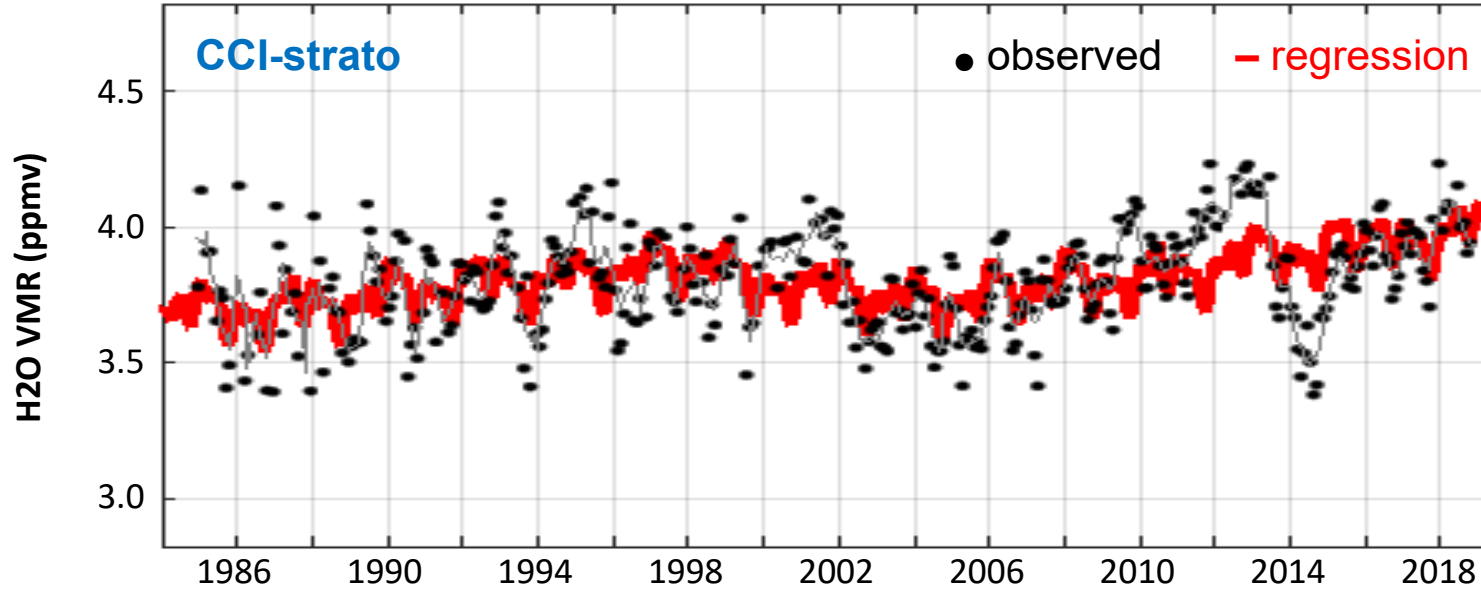

- Use CMAM chemistry-climate model as a transfer function between the different SPARC Data Initiative data to correct relative biases (Hegglin *et al.*, 2014)
- WV_cci improvements: outlier removal & optimal estimation method
- Specifications
 - 1985 - 2019, monthly
 - 90S - 90N, 5° latitude bins
 - 300 - 0.1 hPa, 28 levels
 - mean H₂O VMR and uncertainty

Cfr. previous talk by M. I. Hegglin

Example : 0N-5N at 10 hPa

Contributing limb/occultation sensors

CCI-strato

ESA UNCLASSIFIED - For Official Use

European Space Agency

Contributing limb/occultation sensors

SWOOSH

ESA UNCLASSIFIED - For Official Use

Contributing limb/occultation sensors

GOZCARDS

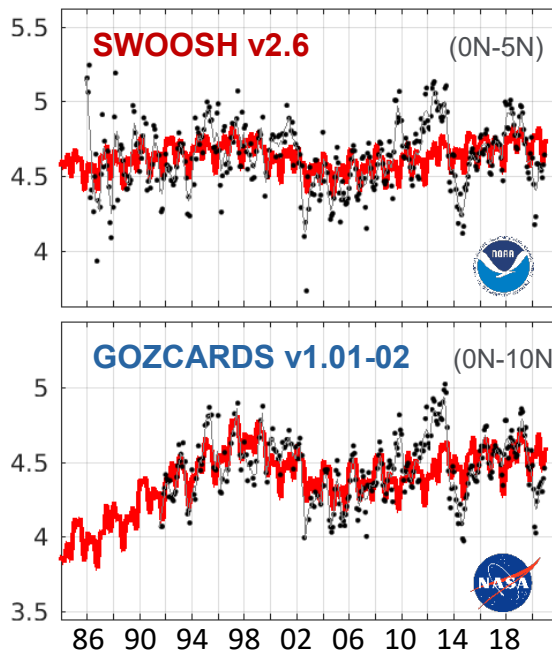

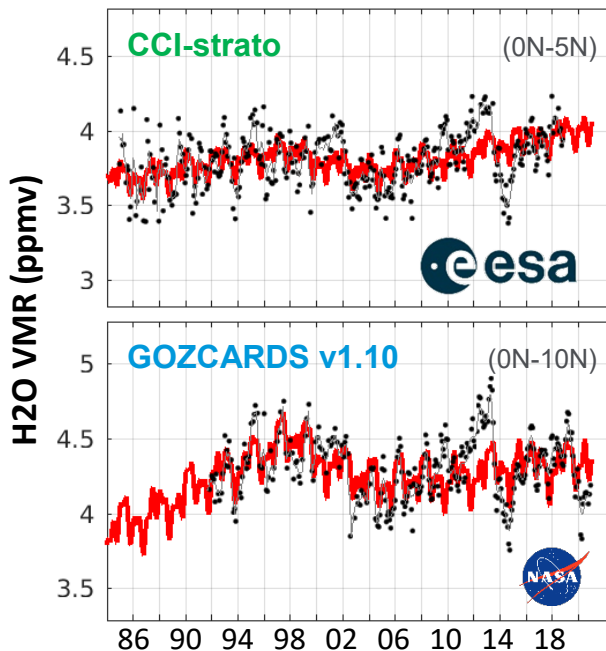

ESA UNCLASSIFIED - For Official Use

Assessment of four H2O CDRs

Differences between Climate Data Records

- Sampling resolution
- Coverage
- Sensors
- Data version
- Auxiliary data
- Offset correction method
- Reference
- Merging method
- Uncertainty budget

ESA UNCLASSIFIED - For Official Use

European Space Agency

Amplitude annual cycle (ppmv)

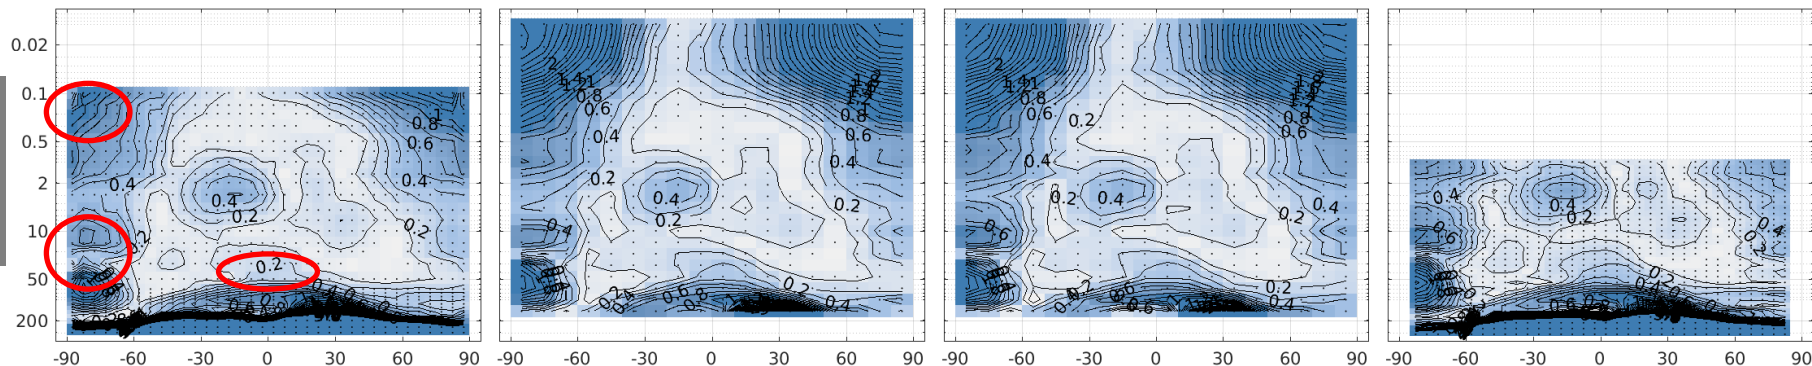

12 month

CCI-strato

GOZCARDS v1.10

GOZCARDS v1.01/1.02

SWOOSH v2.6

- Good agreement in magnitude & spatial structure.
- (Small) low bias of CCI-strato in tropical LS & polar LS/LM (0.1-0.2 ppmv, ~2%)

Amplitude QBO ($ppmv$)

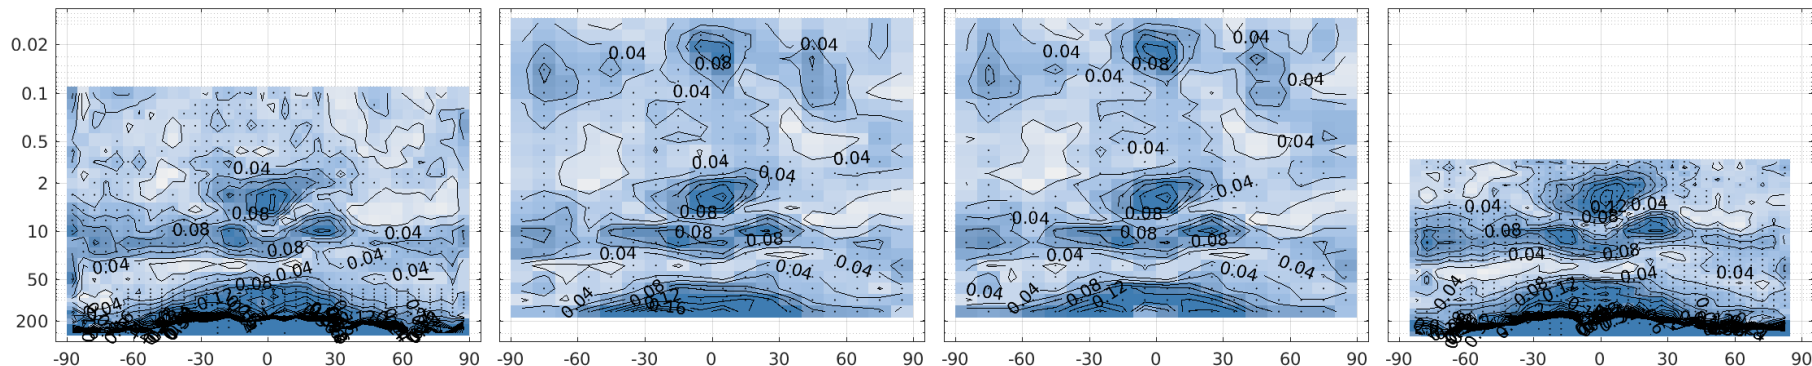

CCI-strato

GOZCARDS v1.10

GOZCARDS v1.01/1.02

SWOOSH v2.6

Excellent agreement in magnitude and structure

ESA UNCLASSIFIED - For Official Use

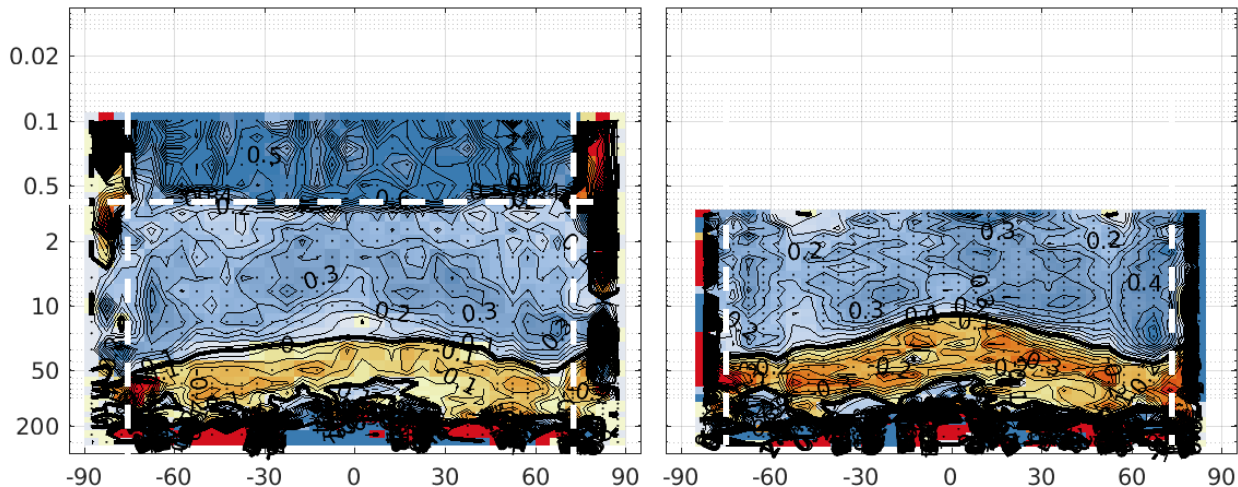

European Space Agency

Trend prior to Jan 1998 (*ppmv/dec*)

CCI-strato

SWOOSH v2.6

- Positive trends in MS & US (+0.35 ppmv/dec, +8%/dec), negative trends in LS (-0.2 ppmv/dec, -6%/dec)
- CCI & SWOOSH agree within < 0.1 ppmv/dec
- Discontinuity for CCI-strato @ 0.7 hPa, due to change in input sensors
- Limited confidence in high-latitude results, due to limited sampling

Trend 1998-2003 (ppmv/dec)

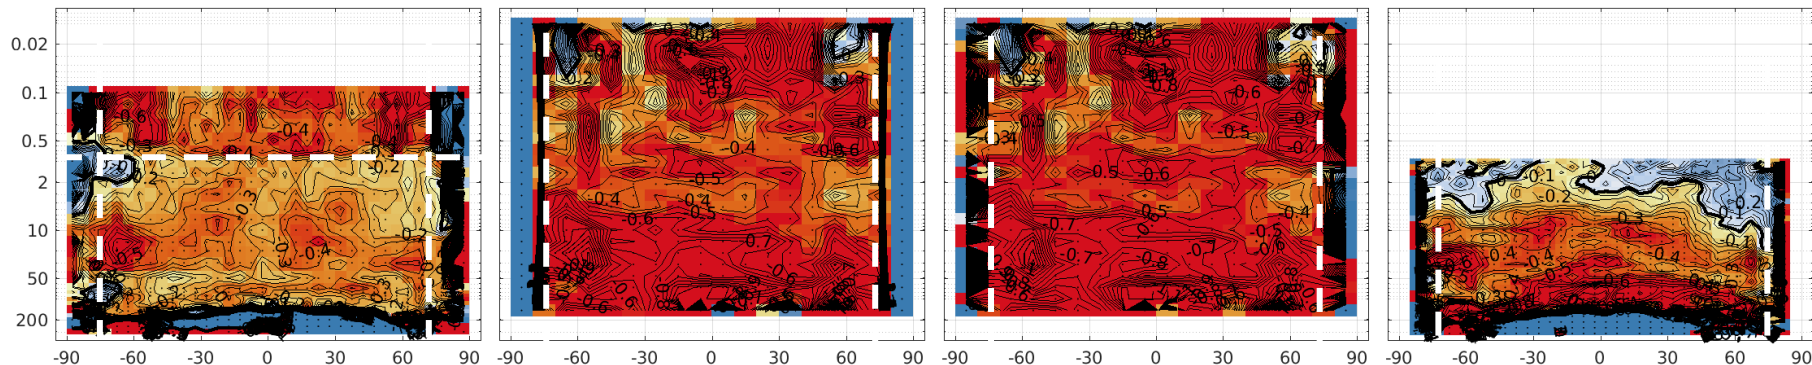

CCI-strato

GOZCARDS v1.10

GOZCARDS v1.01/1.02

SWOOSH v2.6

- Overall agreement in sign of trend : negative
- Significant disagreement in trend magnitude, up to ± 0.4 ppmv/dec
- Discontinuity for CCI-strato @ 0.7 hPa, due to change in input sensors
- Limited confidence in high-latitude results, due to limited sampling

Trend since Jan 2004 (ppmv/dec)

CCI-strato

GOZCARDS v1.10

GOZCARDS v1.01/1.02

SWOOSH v2.6

- Positive trends (+0.1-0.3 ppmv/dec, +2-6 %/dec) across almost entire stratosphere
- CCI, SWOOSH & GOZCARDS v1.01/1.02 agree within < 0.1 ppmv/dec
- Difference (0.1 ppmv/dec) between GOZCARDS versions due to change in Aura MLS (Livesey et al., 2021)
- Reasonable confidence in high-latitude results

Assessment of geophysical cycles and long-term changes

- Structure & magnitude of annual cycle & QBO agree well for all CDRs
- Structure and sign of trends generally agree well
 - Largest disagreement in 1998-2003 period
 - Trends since 2004 depend on Aura MLS version & data sets included

CCI-strato includes more sensors → more independent from other CDRs
