DATA ABOUT US WHAT WE DO SEARCH

European Commission Copernicus EC/MWF

We provide consistent and quality-controlled information related to air pollution and health, solar energy, greenhouse gases and climate forcing, everywhere in the world.

Today's air quality forecasts

The CAMS portfolio includes Earth Observation based information products about:

- **past, current and near-future (forecasts) global atmospheric composition;**
- the ozone layer;
- **air quality in Europe;**
- emissions and surface fluxes of key pollutants and greenhouse gases;
- **solar radiation;**
- climate radiative forcing.

Quarterly validation reports of global and regional outputs.

All data are free and open access

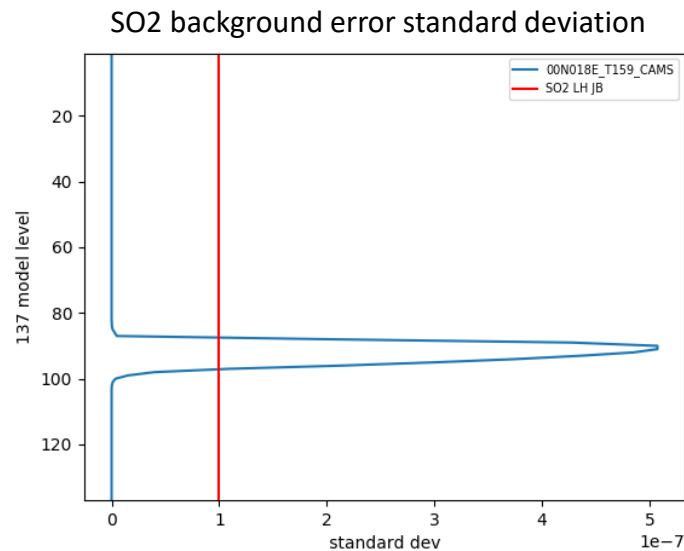

Current use of SO₂ data in CAMS NRT system

CAMS assimilates **GOME-2 (B&C)** and **TROPOMI** total column SO₂ retrievals making use of the volcanic flags provided by data providers (AC-SAF, ESA; algorithm from DLR)

- For operations we need to make assumptions about the plume height if this is not known in NRT
- Default: SO₂ is placed in troposphere at model level 98 (~ 550 hPa, 5 km) using a prescribed bg-error stdv profile
- This can be modified if injection height is known
- Currently: Globally constant injection height

Use of SO₂ Layer Height data in CAMS

- DLR have developed algorithm to provide information about the plume height in NRT from TROPOMI (Hedelt et al., 2019, doi.org/10.5194/amt-12-5503-2019)
- Full-Physics Inverse Learning Machine (FP_ILM) algorithm
- SO₂ LH project - one of ESA's S5P Innovation projects
- These data have been tested in CAMS
- Data useful for SO₂ > 20 DU

SO₂ Layer
height project

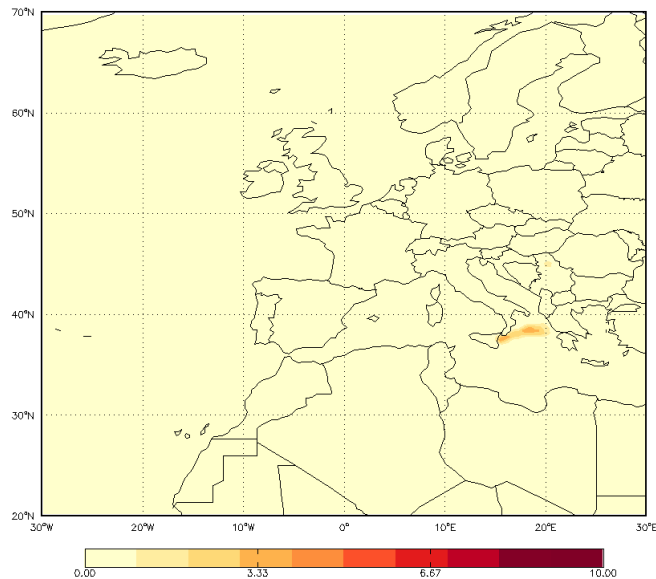

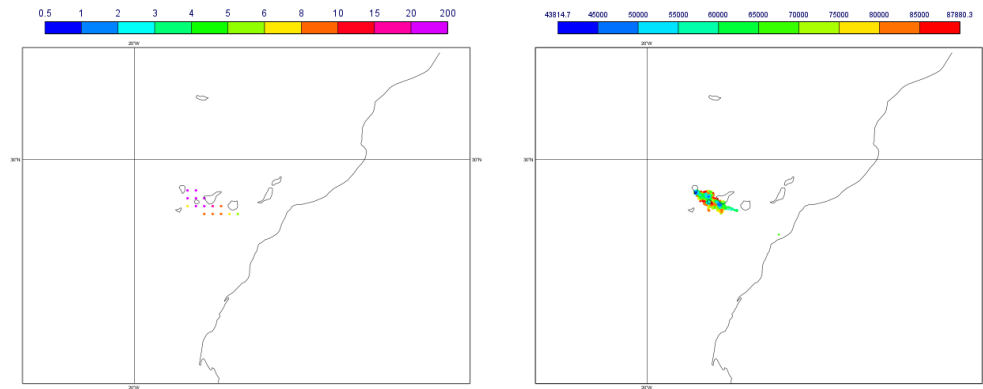

Eruption of Cumbre Vieja volcano: 19 September 2021

- Cumbre Vieja volcano on La Palma erupted on 19 September 2021 for first time since 1971
- First SO₂ detections from GOME-2 & TROPOMI assimilated by CAMS at 06z on 20 September
- TROPOMI layer height ~600 hPa
- Initial transport to the NW across N Africa, Europe and Mediterranean

CAMS TCSO₂ analyses (DU): 19-29 September

Assimilated S5p TCSO₂ (left) & layer height (right) obs on 20 Sept

[DU]

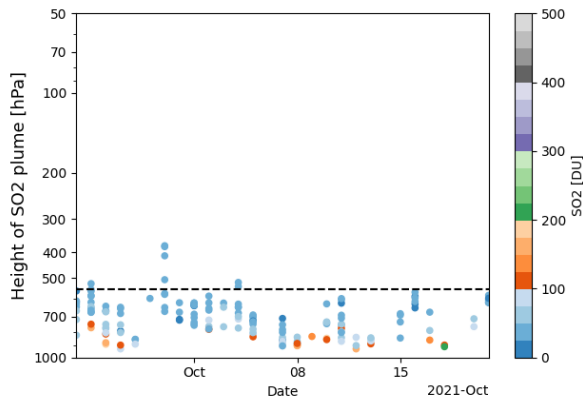

SO₂ emissions and injection height

Atmospheric
Monitoring

S5p height of volcanic plume: 30W-20E, 20-50N

- Thermal anomaly from Cumbre Vieja detected by Terra+Aqua MODIS and assimilated in GFAS.
- Changes in TROPOMI observed SO₂ layer heights correlate roughly with daily FRP data.
- Typical heights between 700-500 hPa below operationally assumed initial layer height at 500 hPa.
- False fire emissions in GFAS led to artificially high AOD (dominated by OM+BC) at La Palma.
 - Not seen at other Aeronet sites

PROGRAMME OF
THE EUROPEAN UNION

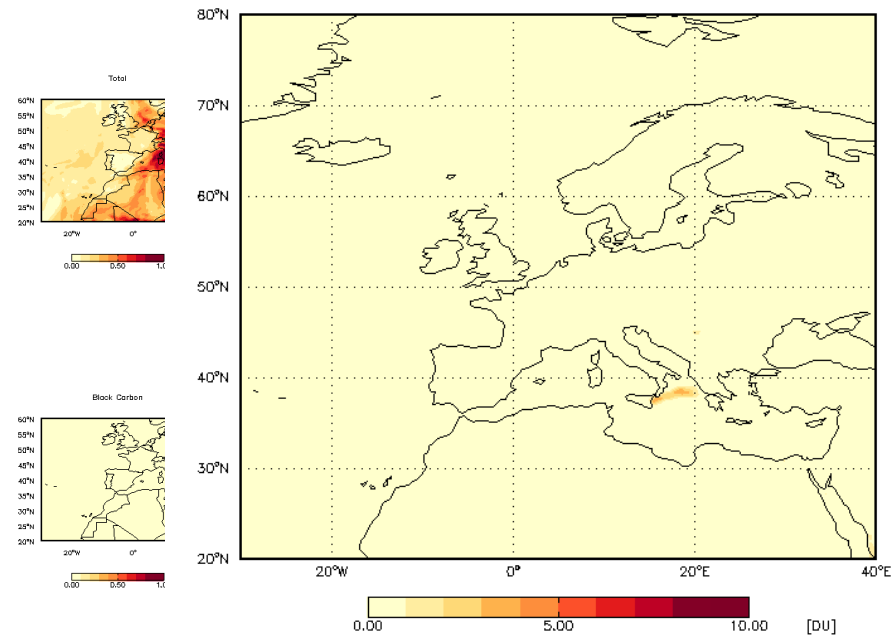

IMPLEMENTED BY

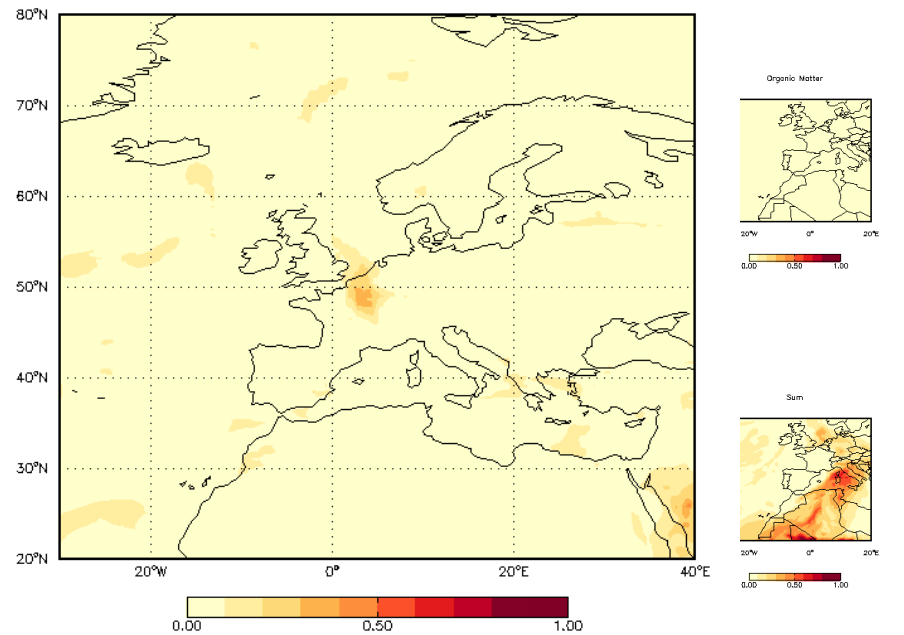

Sulphate aerosol formation

CAMS TCSO₂ analyses (DU): 19-29 September

CAMS Sulphate AOD analyses: 19-29 September

- Sulphate aerosol formation in volcanic plume appears after 2-3 days in operational forecasts (via interactive model chemistry) reaching E Europe to north of Saharan dust plume.

PROGRAMME OF
THE EUROPEAN UNION

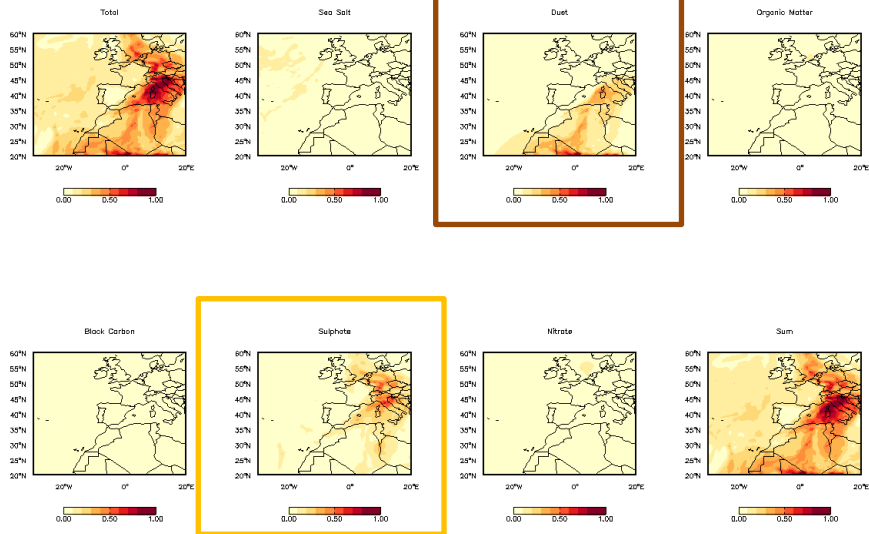

IMPLEMENTED BY

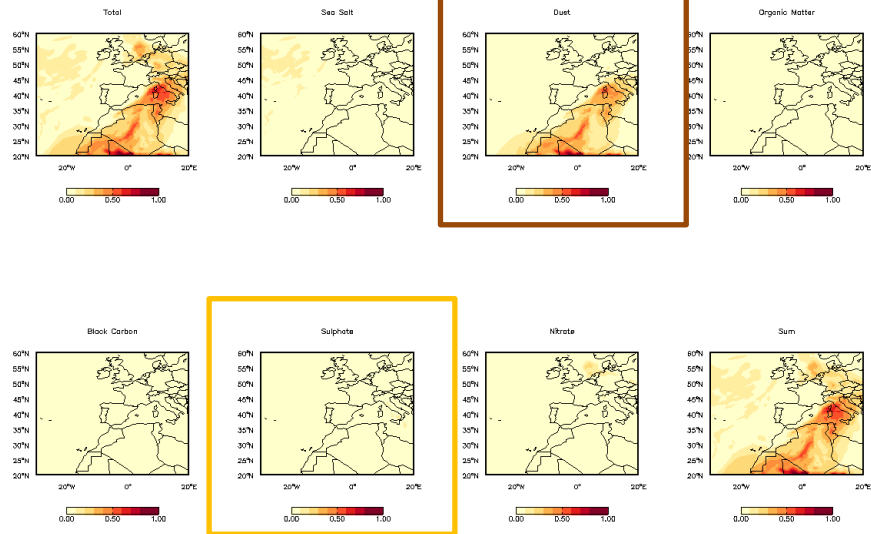

Sulphate aerosol formation

0001, 26 September 2021, 12 UTC

Control (hj7b), 26 September 2021, 12 UTC

- Sulphate aerosol formation in volcanic plume appears after 2-3 days in operational forecasts (via interactive model chemistry) reaching E Europe to north of Saharan dust plume.
- Control experiment (hj7b) shows lower total AOD and corresponding dust plume but not sulphate (indicating origin related to assimilated SO_2).

Long-range transport across the Atlantic

CAMS TCSO₂ analyses (DU)

CAMS Sulphate AOD analyses

28 September –
25 October

SNPP-VIIRS aerosol retrievals on 9 October

- CAMS analyses of TCSO₂ and sulphate AOD show plume reaching Caribbean on a couple of occasions in October.
- NASA Worldview imagery from 9 October shows mixture of dust and fine mode aerosol in visible imagery & SNPP-VIIRS aerosol type retrievals across the Atlantic

Reported air quality impacts

Transport of volcanic plume across the Atlantic coincided with reports of reduced visibility and degraded air quality in:

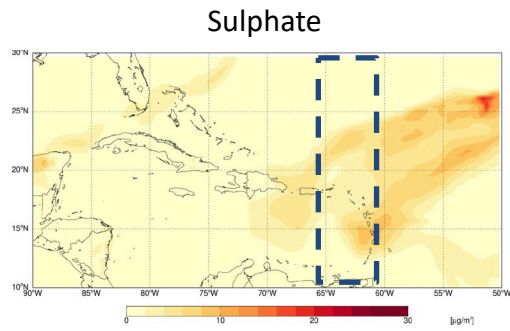

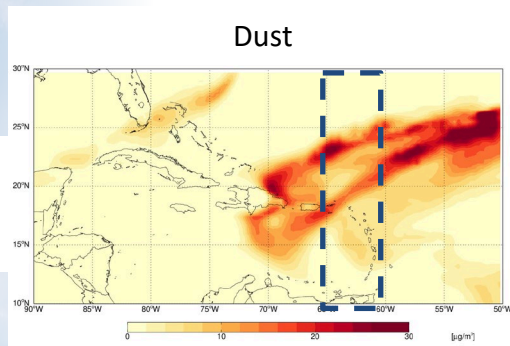

- 3 Oct - Azores
- 4 & 9 Oct - Puerto Rico
- 10 Oct - Dutch Caribbean Islands

CAMS surface aerosol concentrations

Atmosphere
Monitoring

Surface
concentration
[kg/kg]

65-60W zonal
mean cross-
section
[kg/kg]

- Sulphate aerosol mixed with Saharan dust.
- Highest concentrations in dust 'gaps'.

PROGRAMME OF
THE EUROPEAN UNION

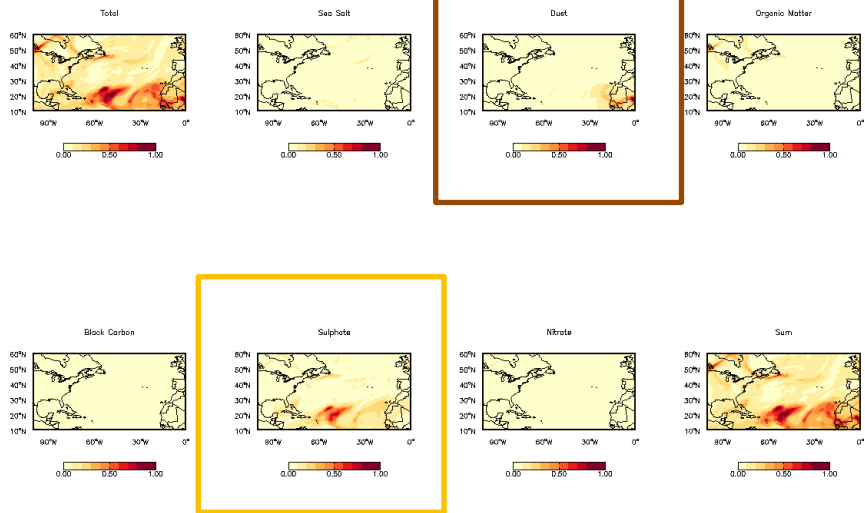

IMPLEMENTED BY

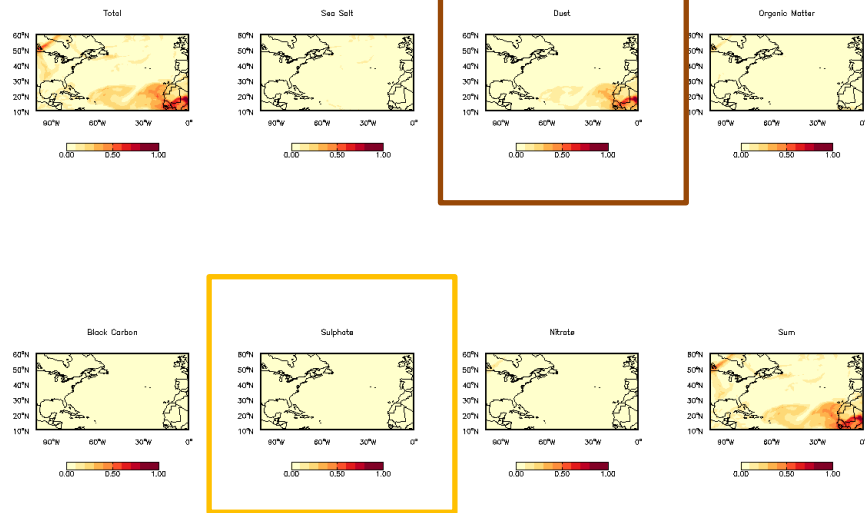

Sulphate aerosol formation

0001, 8 October 2021, 12 UTC

Control (hj7b), 8 October 2021, 12 UTC

- Sulphate AOD is dominant source in CAMS operational forecasts with limited dust AOD transport across the Atlantic.
- Control experiment (hj7b) shows corresponding dust plume but not sulphate (indicating origin related to assimilated SO₂).

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
Cape_San_Juan (18.38°N, 65.62°W). Model: 00UT, 1-31 Oct 2021, T+3 to T+24.

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
La_Parguera (17.97°N, 67.05°W). Model: 00UT, 1-31 Oct 2021, T+3 to T+24.

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
ARM_Graciosa (39.09°N, 28.03°W). Model: 00UT, 1-31 Oct 2021, T+3 to T+24.

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
Tudor_Hill (32.26°N, 64.88°W). Model: 00UT, 1-31 Oct 2021, T+3 to T+24.

Air quality in the Caribbean: aerosol properties & AOD at Cape San Juan, PR

- Aerosol optical property measurements from NOAA aerosol network site
 - <https://gml.noaa.gov/aero/net/getplot.php?key=overview&sta=cpr&type=avg>
- Aeronet fine vs. coarse AOD
 - https://aeronet.gsfc.nasa.gov/cgi-bin/data_display_aod_v3
- Presence of fine-mode aerosol indicates potential sulphate aerosol contribution to observed air quality

Summary

- CAMS is able to monitor atmospheric impacts of volcanic eruptions through assimilation of total column SO₂ and AOD observations.
 - *Inventory of outgassing emissions based on in situ measurements.*
- Following eruption of Cumbre Vieja, CAMS analyses and forecasts provided information on the transport of total column SO₂ across Europe and the Atlantic.
- Conversion of SO₂ into sulphate aerosol through model chemistry results in good agreement in enhancement of total aerosol optical depth vs. Aeronet across Europe and the Atlantic.
- Potential surface air quality impacts in the Caribbean through episode of fine-mode aerosol on 9-10 October.
 - *Ongoing investigation into quantifying the impacts.*
- Some questions remain for the aerosol speciation in the assimilation – could be better resolved with observations of aerosol type (e.g., dust from IASI).
- Future operational assimilation of observed SO₂ layer height information will improve forecast initialization over fixed background errors
