# SO<sub>2</sub> column retrieval

- Based on UV earthshine measurements:
  - SO<sub>2</sub> SCD via DOAS, PCA, etc
  - SO<sub>2</sub> VCD via AirMassFactor (AMF)
- AMF requires assumption about SO<sub>2</sub> profile
  - **Unknown**, depends on source
  - Operational products contain multiple SO<sub>2</sub> VCDs for different scenarios

TROPOMI & GOME2 SO<sub>2</sub> product: **4 VCDs**

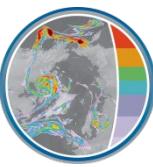

- SO<sub>2</sub> at 15km (Explosive eruption)
  - SO<sub>2</sub> at 7km (Moderate eruption)
  - SO<sub>2</sub> at 1km (Weak eruption & degassing)
  - SO<sub>2</sub> in PBL (Anthropogenic pollution)
- 
- **SO<sub>2</sub> LH required to determine true VCD**

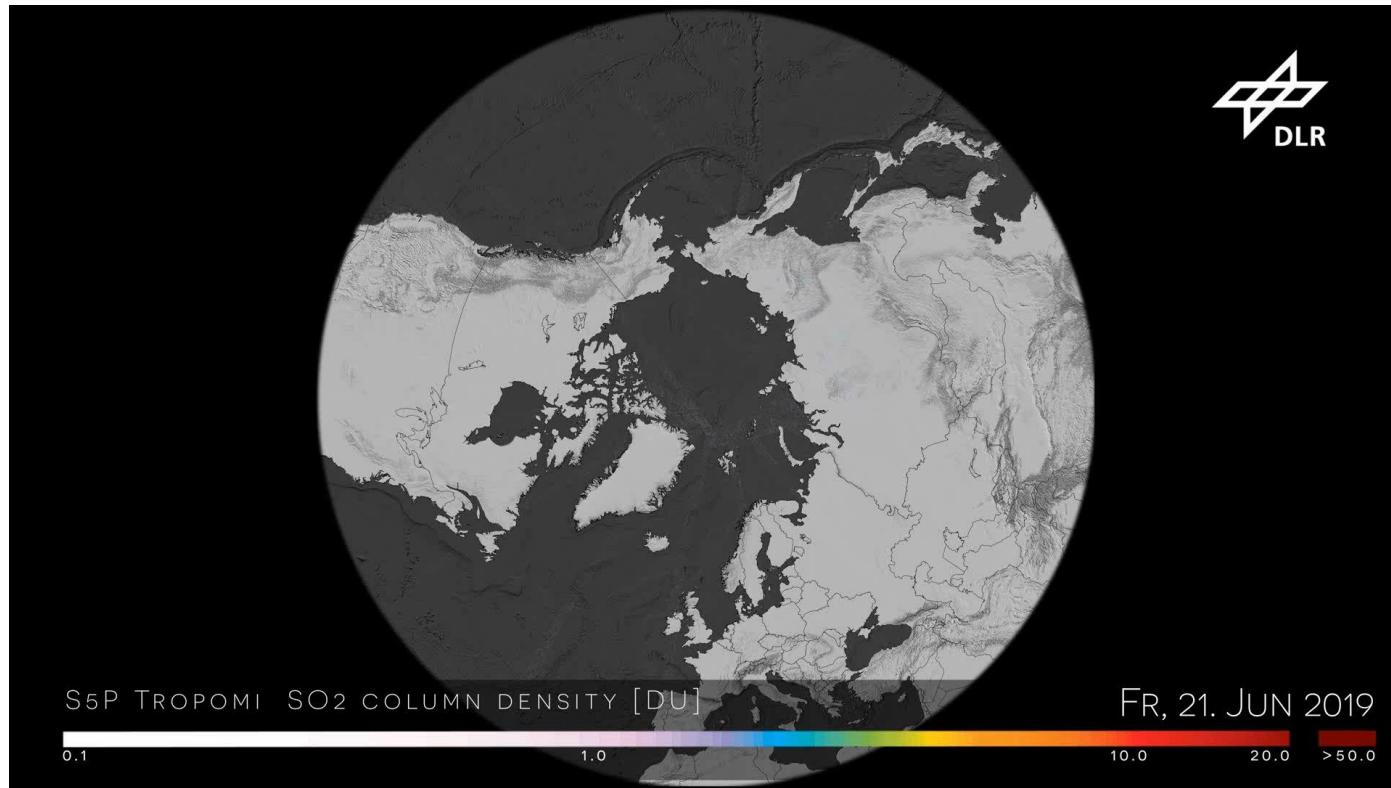

# SO<sub>2</sub> LH retrieval algorithm Full-Physics Inverse Learning Machine (FP\_ILM)

- **Combined PCA & NeuralNetwork regression**
  - Trained with simulated UV spectra (310-340nm, LIDORT RRS, Spurr 2008)
- **Extremely fast:** 3min per TROPOMI orbit
- **Accurate:**  $\sigma_{\text{LH}} < 2\text{km}$  (SO<sub>2</sub> VCD > 20 DU)
- **Versatile:** Easily applicable to any UV instrument (GEMS, S4, S5, ...)
  - Metop/GOME-2 (Efremenko et al. 2017)
  - S5p/TROPOMI (Hedelt et al. 2019)
  - AURA/OMI (Fedkin et al. 2020)
- **Optimized** in framework of **ESA S5P+I: SO2LH** project
- **Validated** against IASI / CALIPSO (Koukouli et al. 2022)
- **Semi-operational SO<sub>2</sub> LH retrieval (hourly):** DLR-INPULS project
- **Assimilation** by ECMWF/CAMS (Inness et al. 2022)

# Raikoke eruption in June/July 2019

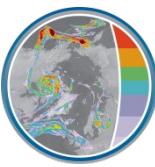

- Massive eruption on 21/22 June 2019
- High-altitude ash & SO<sub>2</sub> plume reaching stratosphere
- SO<sub>2</sub> plume detectable until September 2019

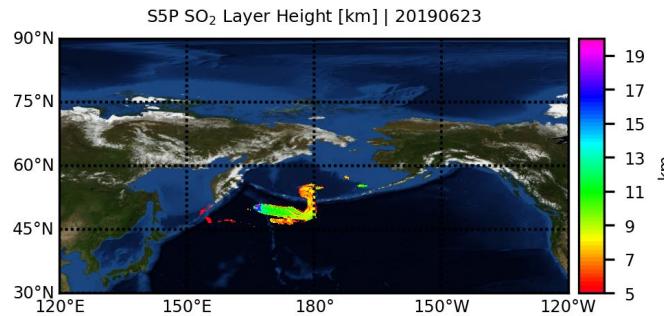

Chart 4

# Raikoke 2019: Validation against IASI SO<sub>2</sub> LH products

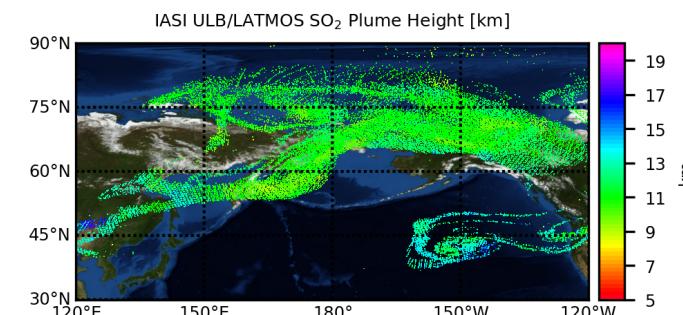

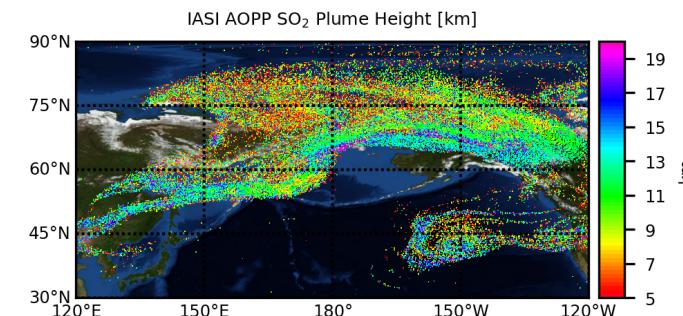

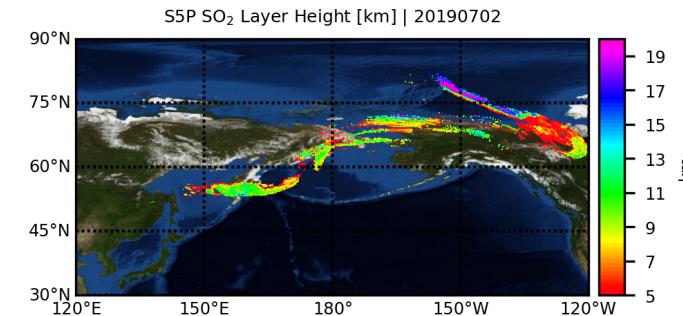

S5P

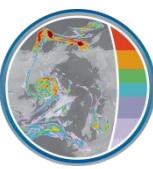

IASI AOPP

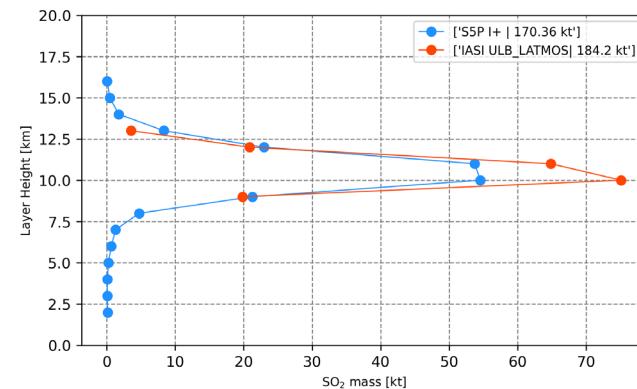

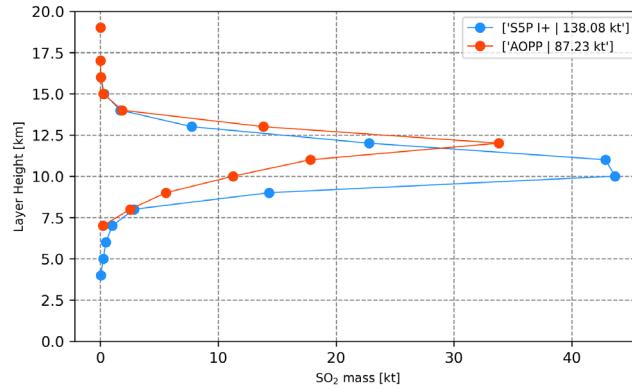

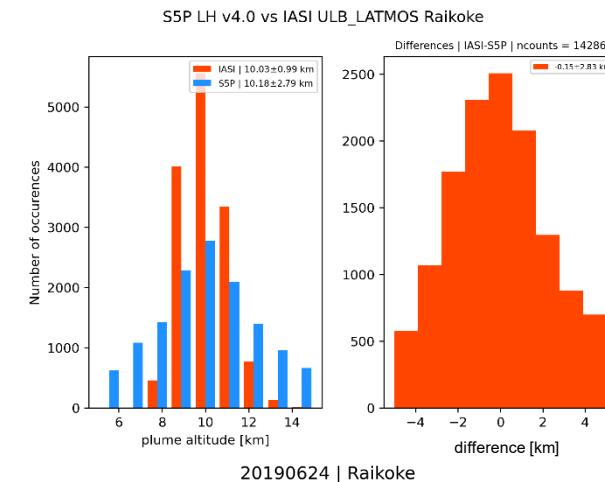

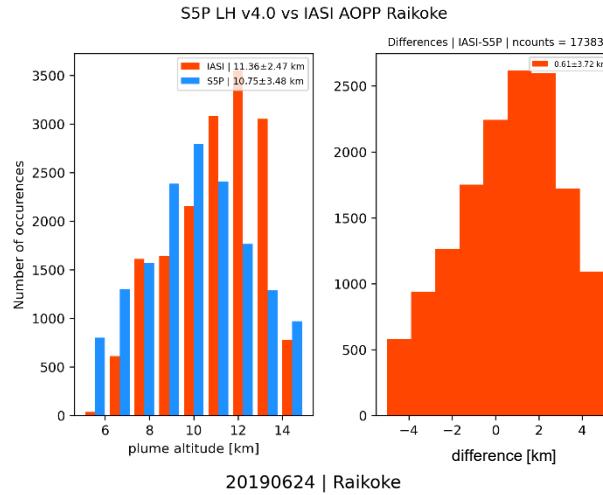

IASI ULB

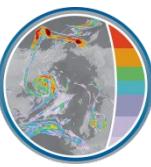

# Raikoke 2019: Validation against IASI SO<sub>2</sub> LH products

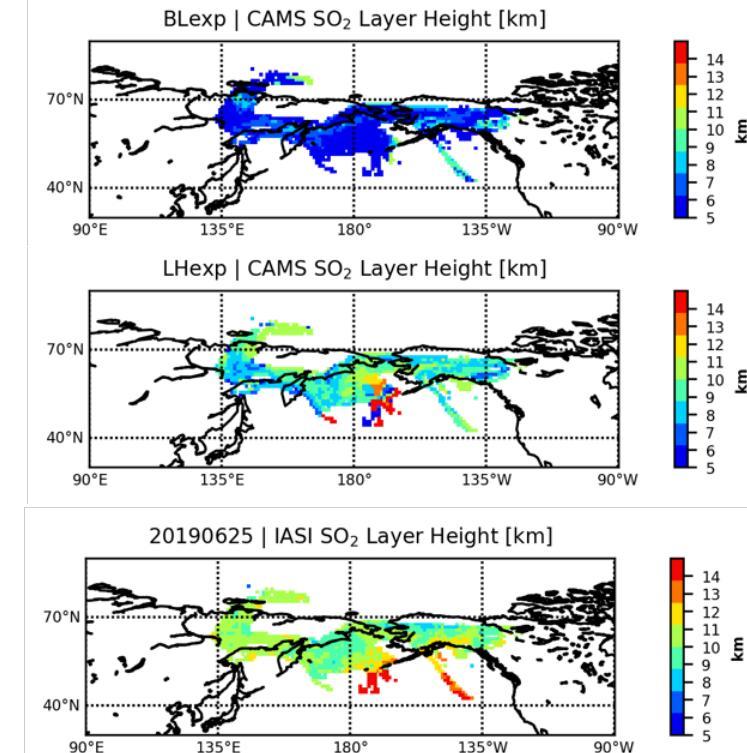

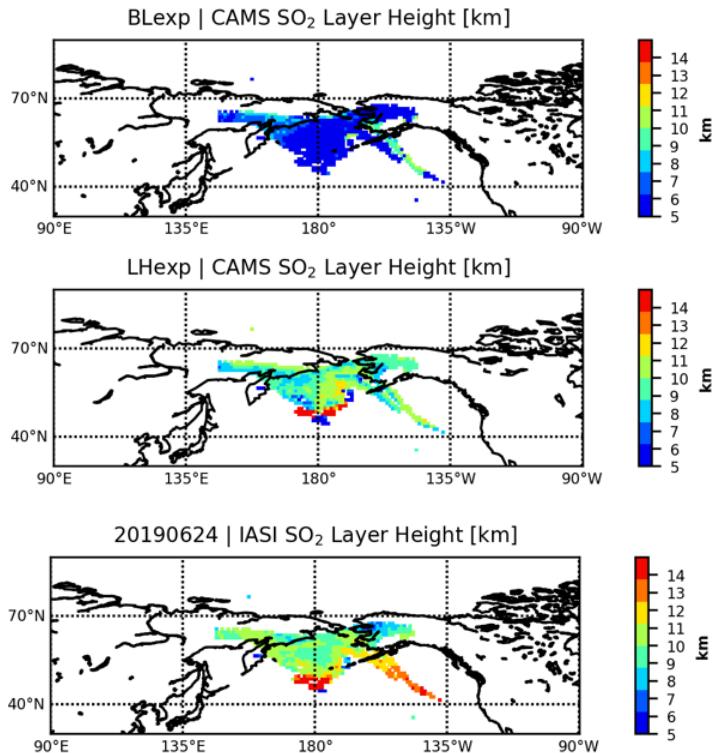

→ Mean LH difference between sensors  $\sim \pm 0.5 \pm 3$  km (Koukouli et al. 2022)

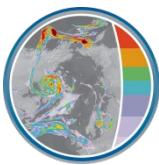

# Raikoke 2019: ECMWF/CAMS assimilation

Assimilation of S5P SO<sub>2</sub> LH product by CAMS (Inness et al. 2022)

- Vast improvement of CAMS forecast when S5P SO<sub>2</sub> LH data is used (LHexp)
- CAMS forecast vs IASI:  $-1.5 \pm 2.5$ km (BLexp:  $-5 \pm 2$ km)

# Cumbre Vieja eruption Sept - Dec 2021

VOLCANO  
DISCOVERY

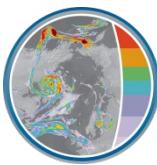

- Eruptive phase: 19 Sept to 12 Dec 2021
- Low altitude ash & SO<sub>2</sub>

Cumbre Vieja

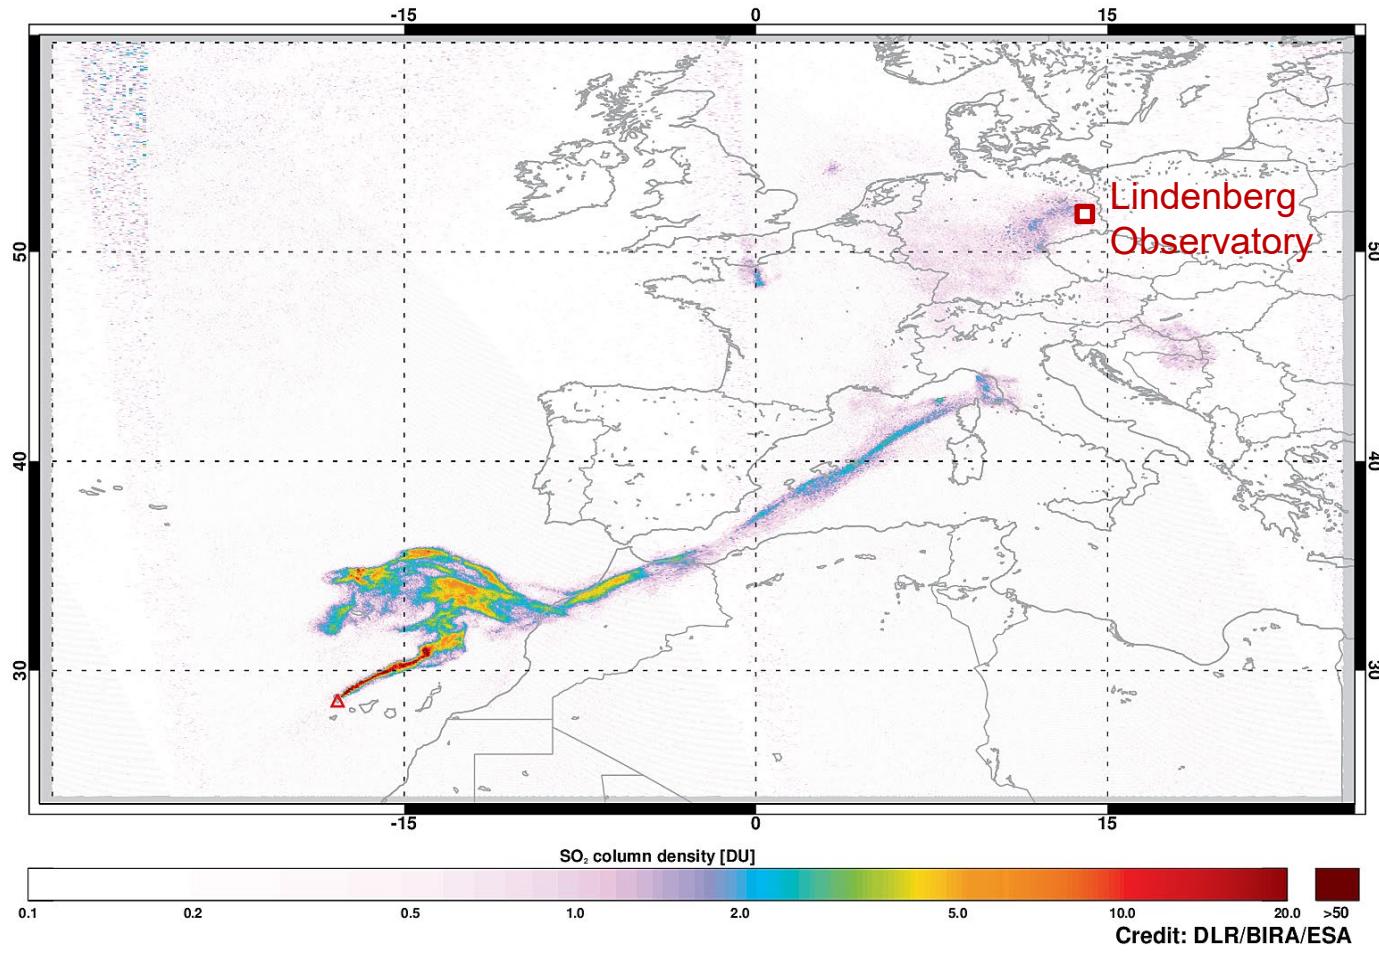

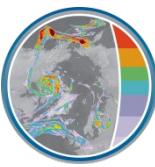

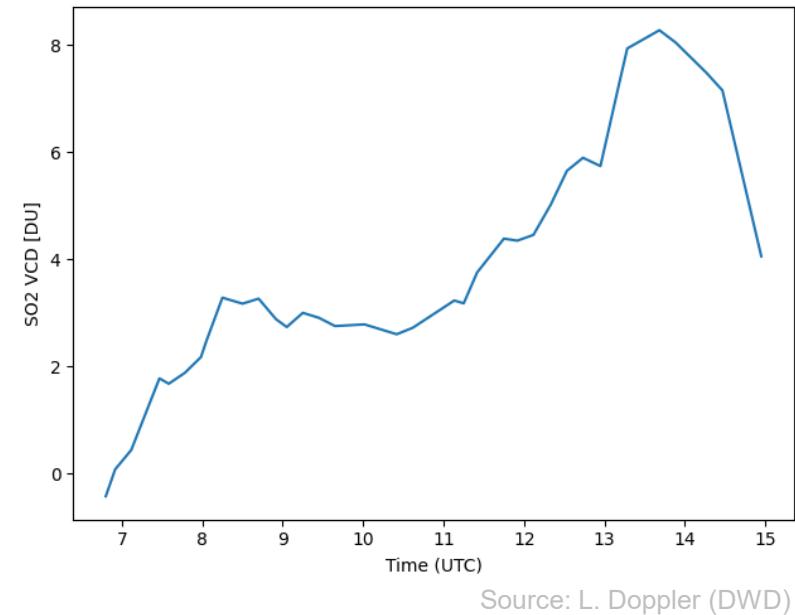

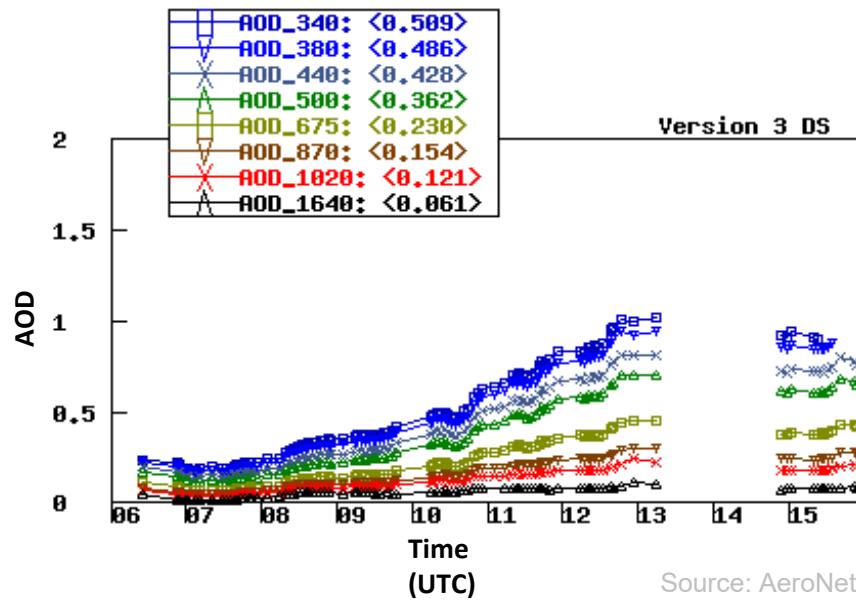

Chart 10

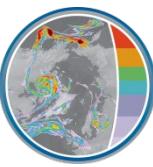

# Lindenberg Observatory (Germany)

## Brewer measurements on 26 Sept. 2021

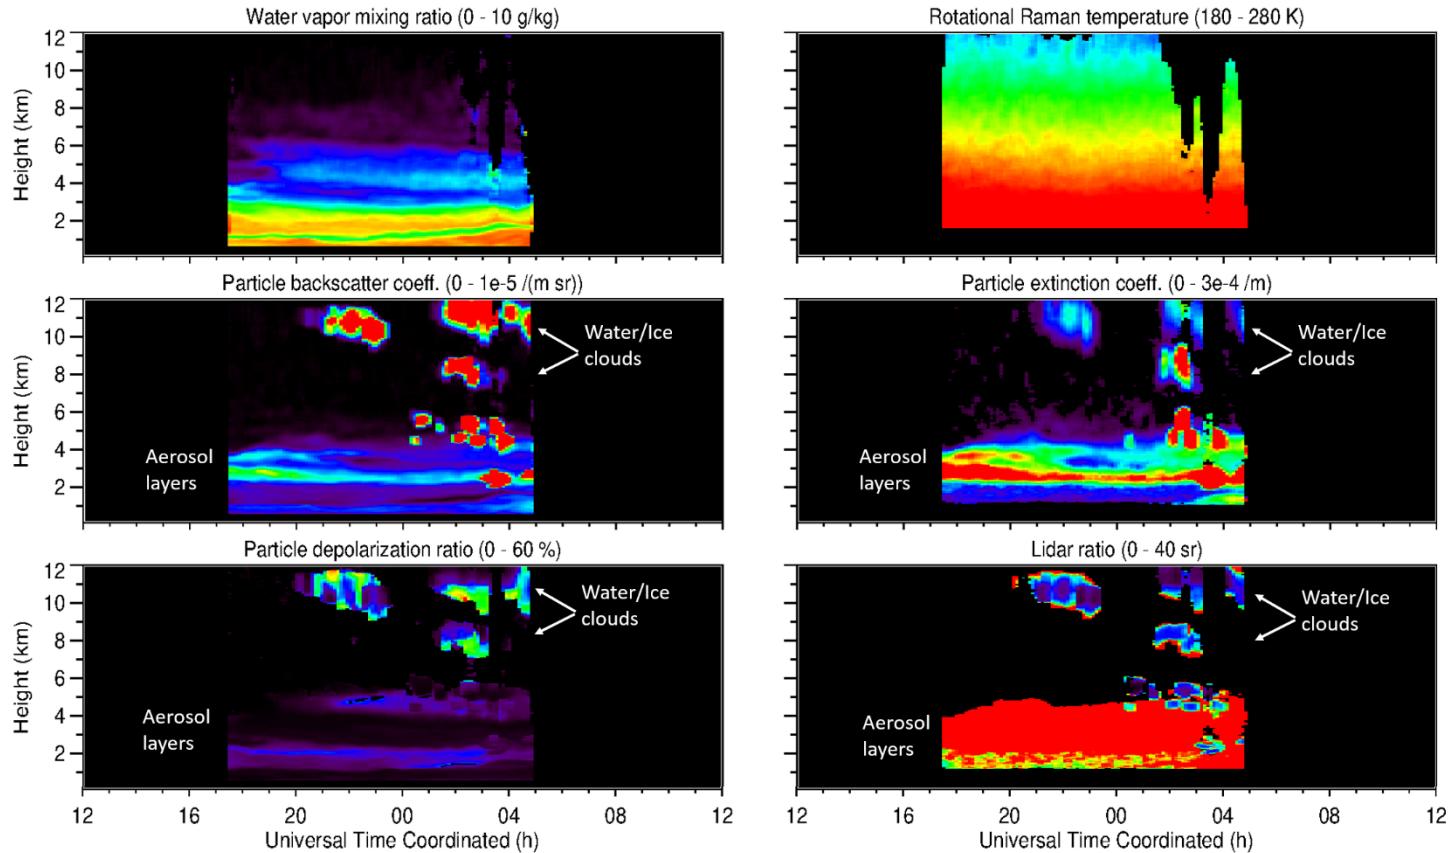

- Detection of increased AOD and SO<sub>2</sub> on 26 Sept. 2021
- Maximum at about 14:00 UTC

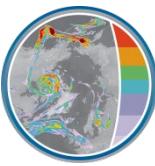

# Lindenberg Observatory (Germany)

## Raman-LIDAR measurements 26/27 Sept. 2021

Source: L. Doppler (DWD)

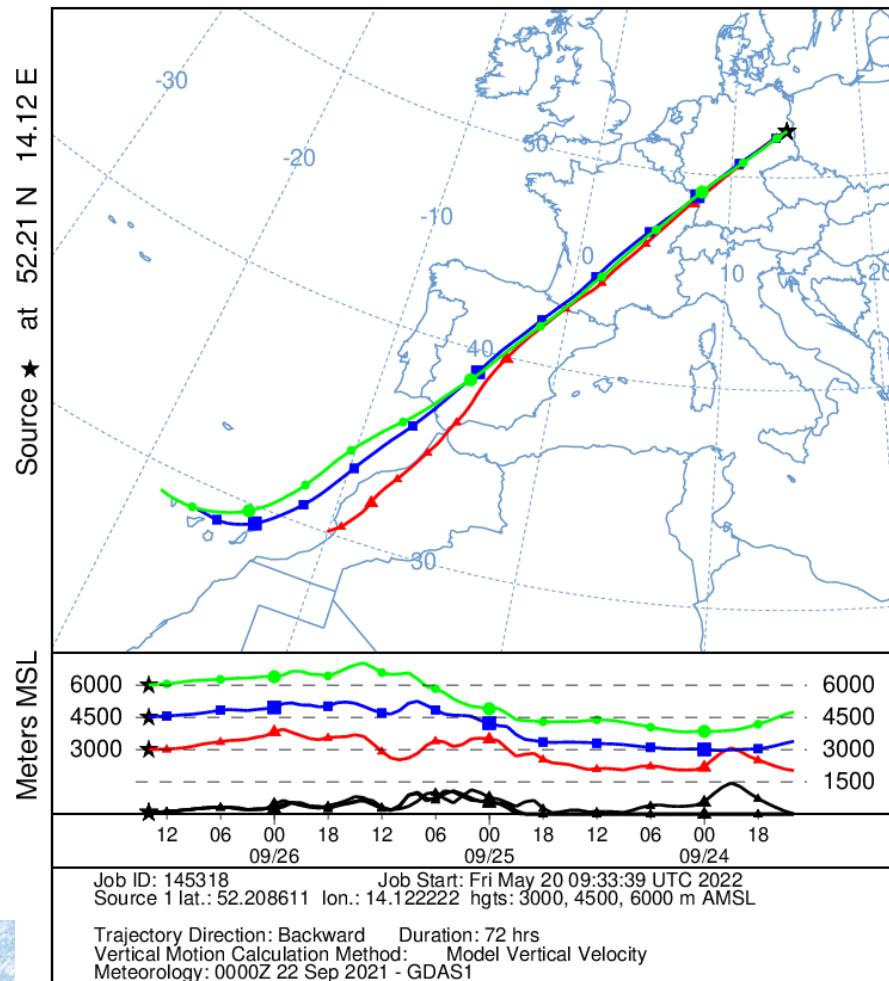

- Detection of aerosol layers at 2-5km below patchy water/ice clouds
- Volcanic aerosol: Strong extinction, low depolarization ratio, high Lidar ratio

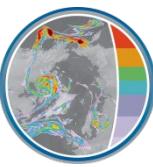

# Cumbre Vieja eruption Backward trajectories

- HySplit back-trajectories from Lindenberg Observatory
- Starting altitude: 4 – 6 km
- Starting time: 14:00 UTC
- Injection at Cumbre Vieja: 23 September 2021
- Injection height @ CumbreVieja 3 – 5 km

NOAA HYSPLIT MODEL  
Backward trajectories ending at 1400 UTC 26 Sep 21  
GDAS Meteorological Data

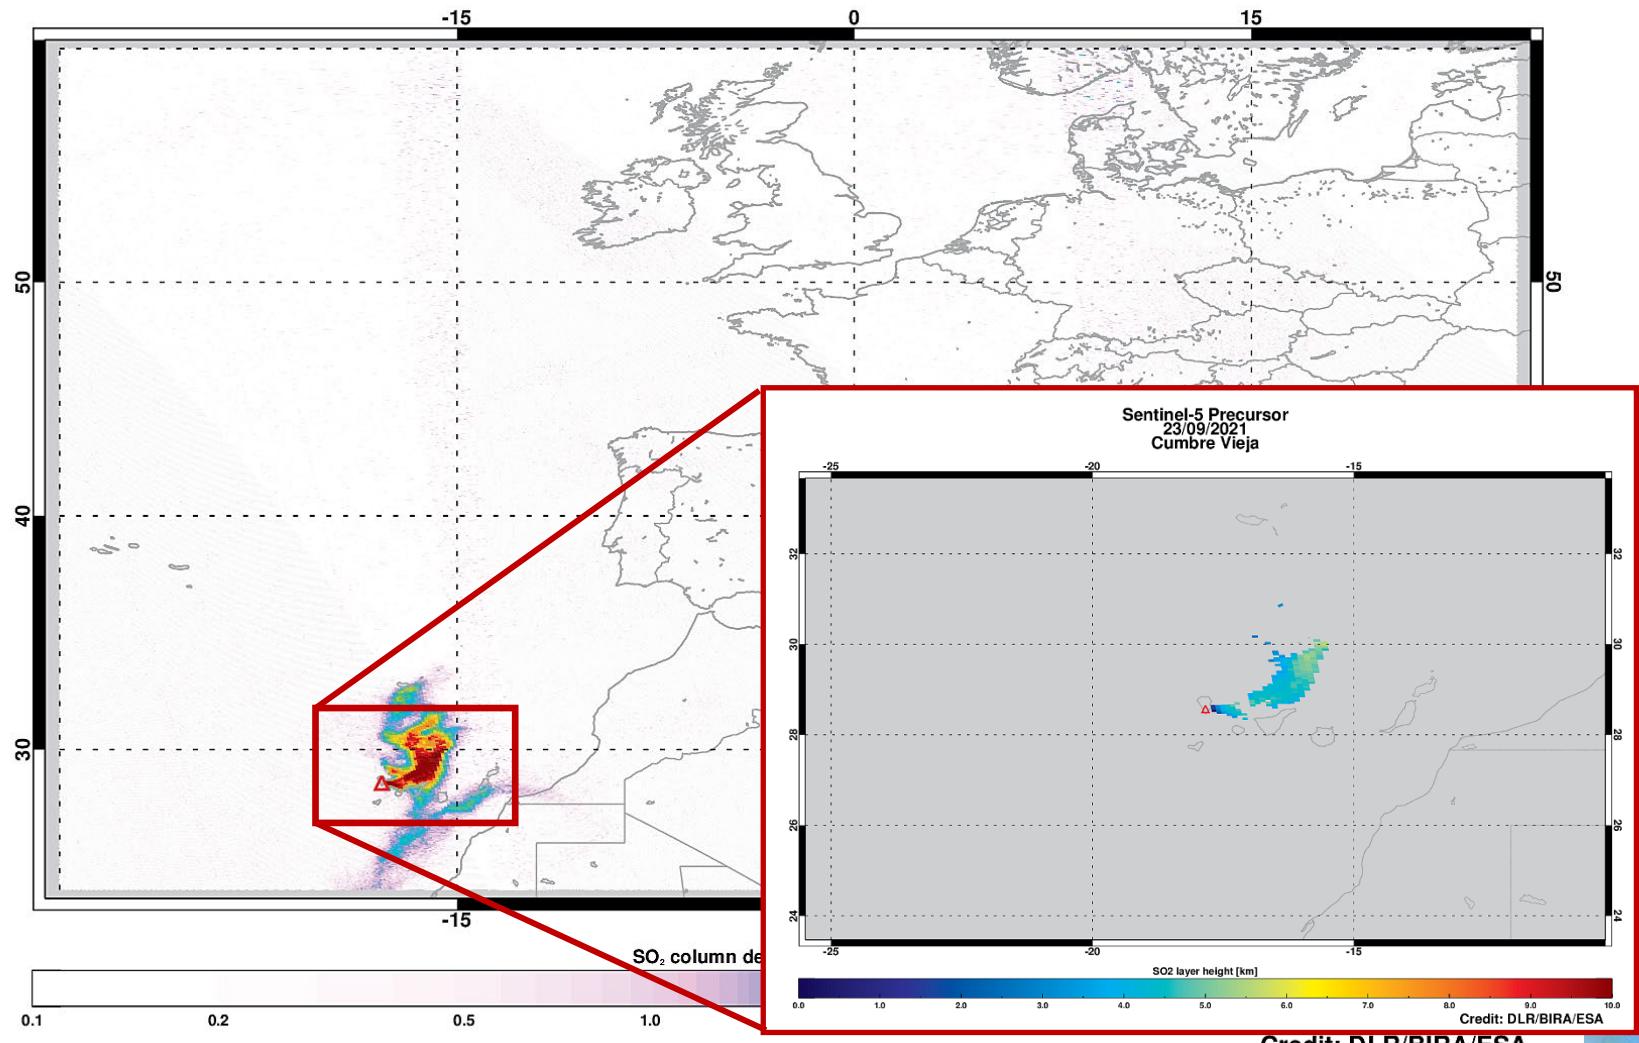

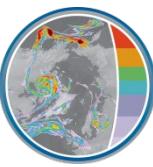

# Cumbre Vieja eruption 23 Sept. 2021

## TROPOMI SO<sub>2</sub> VCD & LH

Cumbre Vieja

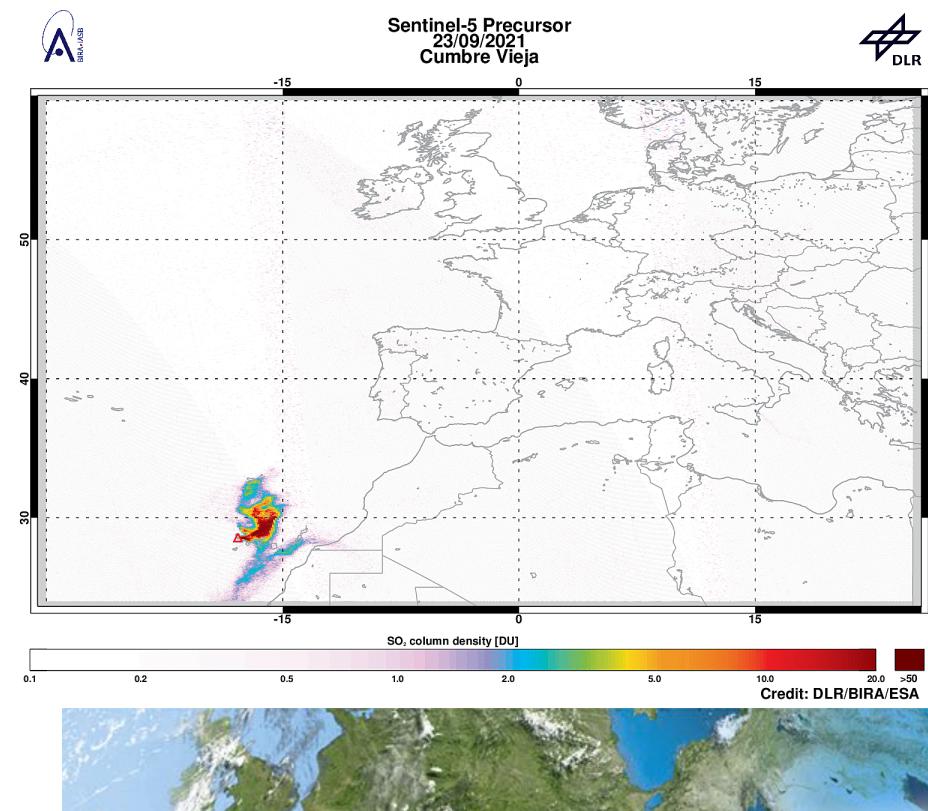

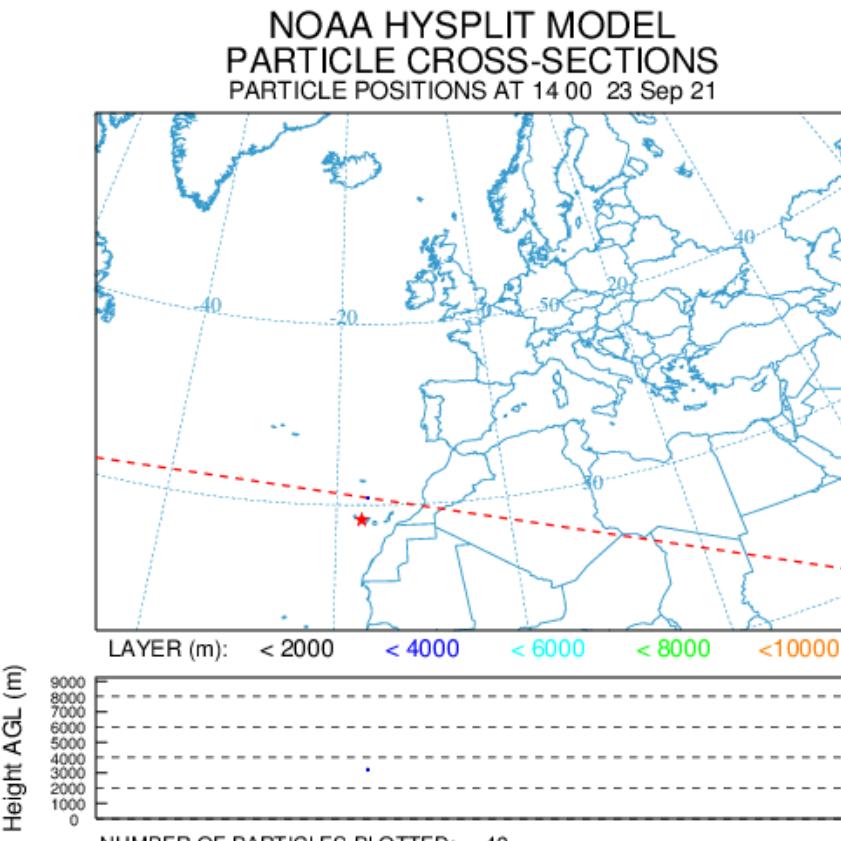

Credit: DLR/BIRA/ESA

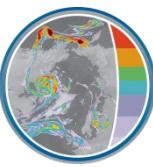

# Cumbre Vieja eruption 2021

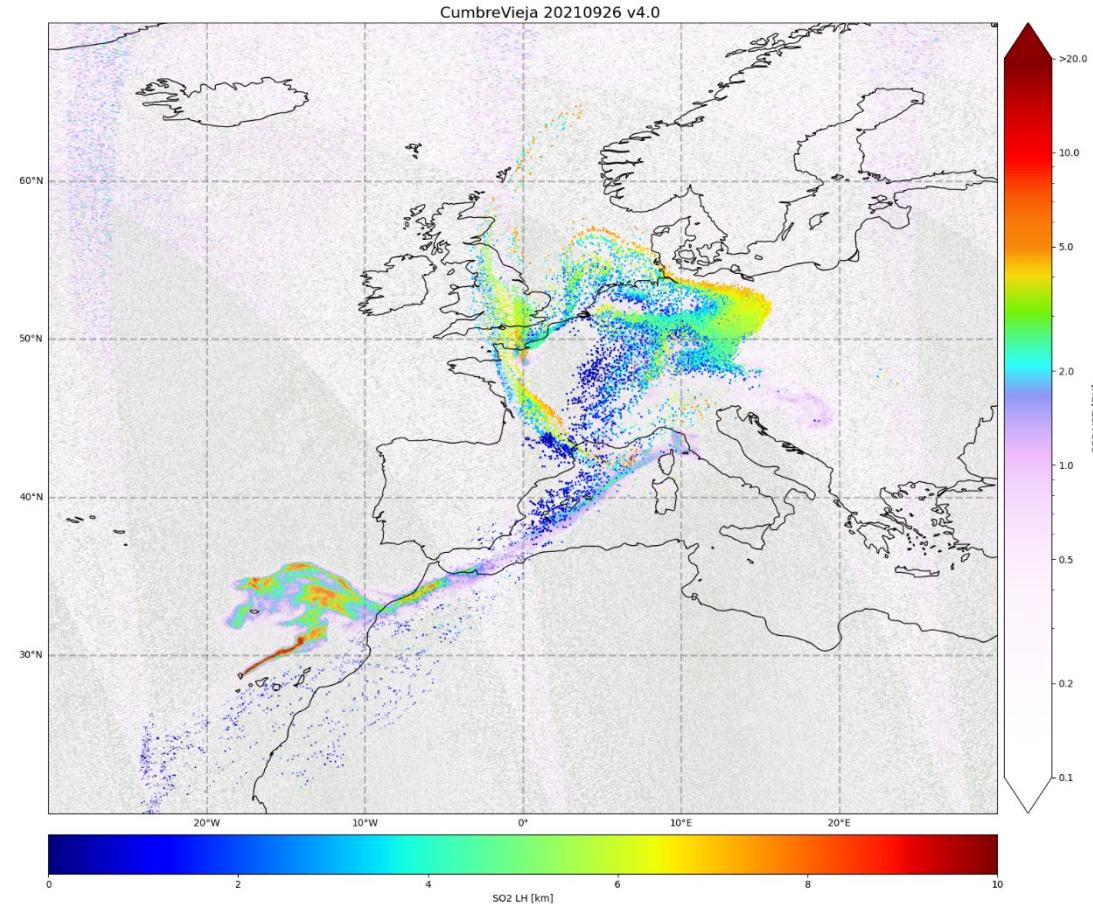

## HySplit simulations

- HySplit forward calculations starting from Cumbre Vieja
- Run duration: 23 – 26 September 2021
- Particles launched at TROPOMI SO<sub>2</sub> pixel locations / time / SO<sub>2</sub> LH

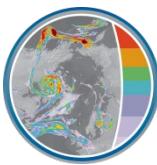

# Cumbre Vieja eruption – 26 Sept 2021 TROPOMI VCD vs HySplit simulations

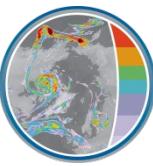

Very good agreement of particle positions and TROPOMI measurements

## Conclusion & Outlook

- FP\_ILM algorithm is able to retrieve SO<sub>2</sub> LH from UV satellite data
  - **Extremely fast and accurate**
  - **Versatile** (TROPOMI, GOME-2, OMI)
  - **Quasi-operational** retrieval of SO<sub>2</sub> LH
  - Public dataset available on SO<sub>2</sub> LH **project website**:  
<https://atmos.eoc.dlr.de/so2-lh> (Google: Search for “SO2LH”)
- S5p SO<sub>2</sub> LH product is actively **assimilated by ECMWF/CAMS**
- **Raikoke**: Very good agreement with IASI SO<sub>2</sub> LH and CALIPSO
- **Cumbre Vieja**: Preliminary analysis shows very good agreement with ground-based measurements

# SO<sub>2</sub> LH: Outreach

- Twitter account @DLrSO2: <https://twitter.com/DLrSo2>
- Automatic detection of volcanic eruptions & immediate twitter notification
  - Name of volcano erupted, SO<sub>2</sub> VCD, SO<sub>2</sub> LH, SO<sub>2</sub> mass

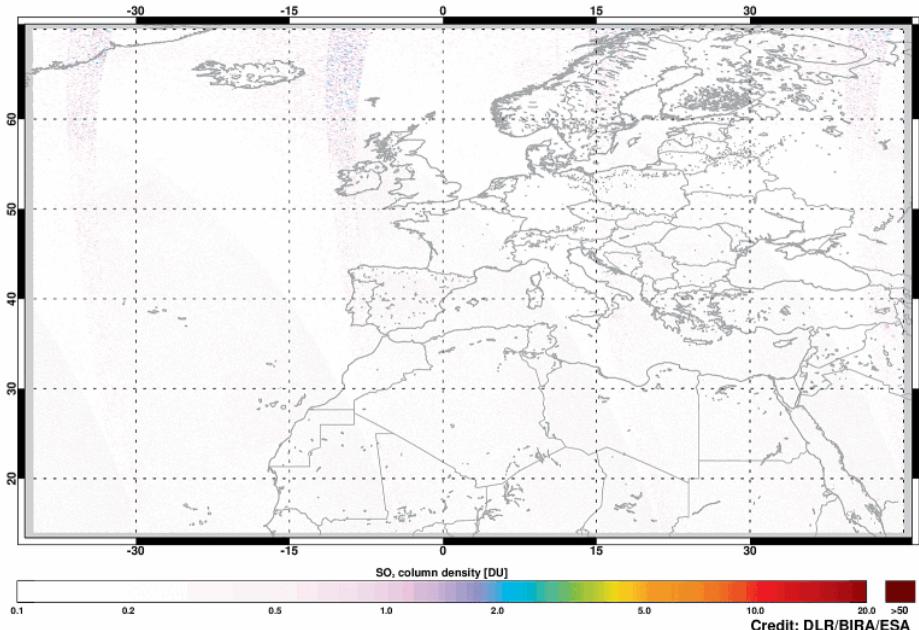

TROPOMI SO2 @DLrSo2 · 23. Nov.

Updated animation of #S5p #tropomi SO2 measurements of the #CumbreVieja volcanic eruption from 19 Sept - 22 Nov. Note the extended plume from #Etna on 24 Oct!

Sentinel-5 Precursor  
19/09/2021

TROPOMI SO2  
@DLrSo2

On 2022-04-24 #TROPOMI has detected a strong SO<sub>2</sub> signal of 27.10DU at a distance of 130.8km to #Krakatau. @tropomi #S5p #Sentinel5p @DLR\_en @BIRA\_IASB @ESA\_EO #SO2LH
