

# NASA's Surface Deformation and Change Designated Observable Architecture Study Current Status

Batu Osmanoglu @nasa.gov

Gerald Bawden (HQ), Jordan Bell (MSFC), Stephen Horst (JPL), Christopher Jones (LaRC) Andrew Molthan (MSFC), Shadi Oveisgharan (JPL), Paul Rosen (JPL), Katia Tymofyeyeva (JPL)

## EARTH SYSTEM OBSERVATORY

INTERCONNECTED CORE MISSIONS

## SURFACE BIOLOGY AND GEOLOGY

Earth Surface and Ecosystems

### SURFACE DEFORMATION AND CHANGE

Earth Surface Dynamics

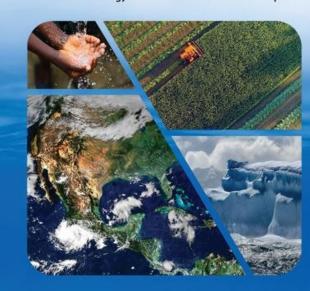

#### CCP

The National Academies of CIENCES • ENGINEERING • MEDICINE

CONSENSUS STUDY REPORT

## THRIVING ON OUR CHANGING PLANET

A Decadal Strategy for Earth Observation from Space

## CLOUDS, CONVECTION AND PRECIPITATION

Water and Energy in the Atmosphere

#### **AEROSOLS**

Particles in the Atmosphere

#### MASS CHANGE

Large-scale Mass Redistribution

## Surface Deformation and Change (SDC) Architecture Study Objectives

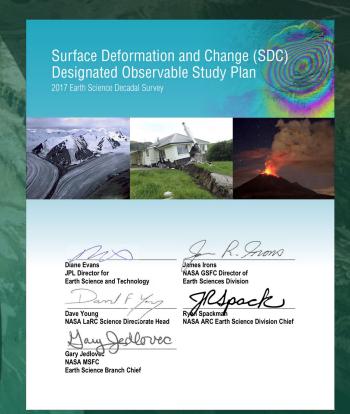

Determine cost-effective SAR-based architecture to implement the Decadal Survey's SDC geodetic observables

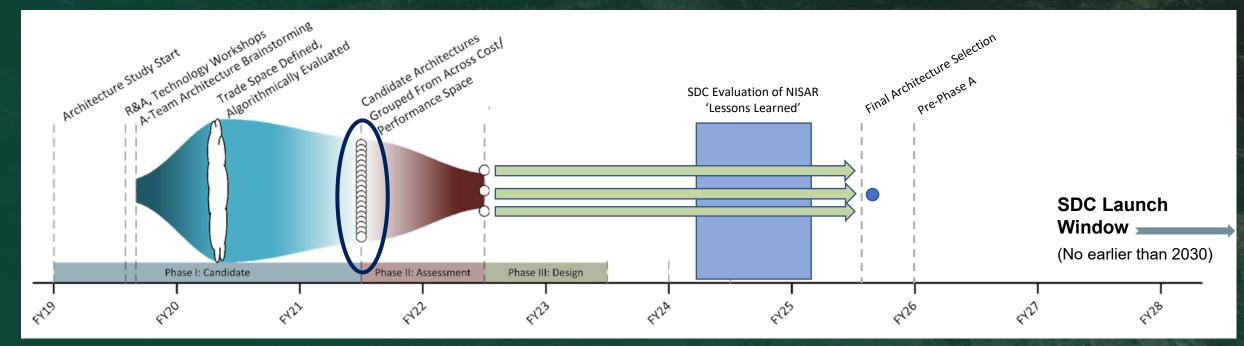

Understand the cost/benefit of other Science and Applications in the SDC trade space

Engage emerging best and new practices in industry including smallsat constellations and commercial data purchases

Explore international partnerships to leverage capability and reduce cost.

#### Where are we today?

- Original SDC Study Timeline
- ESO: Lessons learned from NISAR will guide the SDC architecture development and selection
- Final SDC selection will likely be mid-2025

NISAR Launch Commissioning + 3 yrs science ops

#### NISAR is a "trailblazer" for the ESO

- The SDC Study Team just completed the initial downselect
- Today we will review the SDC downselect approach and architectures that were selected.

### **SDC Downselect Process (Phase II.a)**

#### EARTH SYSTEM OBSERVATORY

#### Phase II.a Assessment

Science: Performance tool + heuristics
Applications: Feasibility + Mapping
Cost: High-level parametric/analogs
Risk: Initial mapping from survey
Programmatic Factors: Expert Opinion

#### Phase II.b Assessment

**Science**: Performance tool (+ heuristics), refined methodology

Applications: Refined methodology

Cost: Refined parametric/analogs, independent cost estimate

Risk: Risk matrix, technology readiness assessments

Programmatic Factors: Expert Opinion

Nov.

2022

**HQ Sync Point** 

## Potential Options (40)

June

2021

**HQ Sync Point** 

- Large number of options with varying capabilities
- Identify key architecture elements/building blocks
- Identify drivers and trade-offs
- High-level metrics used to consolidate and refine architecture set
- Point of departure for deep dive assessments

### Feasible Options (10)

- Smaller set of feasible architectures, warranting deeper dive
- Science, cost assessments are refined
- Risk, Programmatic factors are assessed
- Concurrent Eng. Studies

Recommended Options (~3)

Phase III

Final Arch.

TBD FY25

June 2022

**HQ Sync Point** 

#### Phase III Assessment

**Decision structuring**: Identifying what is different relative to previous downselects **Assessment approach**: Designing and implementing decision-making structure **Facilitation**: Supporting assessments, analysis, and documentation of decision

Phase I

## Architecture groups

Flagship

Distributed Repeat Track

**Multi-Squint Formation** 

**Lowered Inclination** 

**Helical Orbit Formation** 

**Alternative Water Vapor Techniques** 

### Value in the SDC Study

- Architecture Grouping (e.g. single flagship) risks
- Individual Architecture risks

- Feasibility quantifies likelihood an architecture achieves Science performance targets for an Observable
- Relevance weights the utility of an Observable to a DS Goal
- Benefit is product of Feasibility and Relevance, aggregated at DS Goal level or higher

**EARTH SYSTEM** OBSERVATORY

**Applications** 

- NASA Instrument Cost Model
- Historical Analogues for Spacecraft
- NISAR-based operations estimates

 12 Communities and 26 **Programmatic Potential Enabled Applications Factors** mapped to Observables

#### EARTH SYSTEM OBSERVATORY

#### Summary

- We have completed a value framework to quantitatively assess system architectures against a variety of science, applications and programmatic requirements.
- Applied the framework to 40 architectures and selected 10 L-band architectures for further study.
  - We eliminated low-inclination orbits.
  - Remaining architectures span from small satellites to flagships
- Partnerships add significant value to the SDC mission.
- Exploring the specifics of partnerships is becoming important at this point of the study.
  - Engaging with industry in co-development possibilities
  - We are open to dialogue for all options.
