# Presentation outline

- ✓ **Mission scientific objectives**
- ✓ **Data exploitation plans**

- Mission objectives
- Background on vegetation fluorescence
- Requirements and retrieval approach
- Mission products
- Data exploitation plans

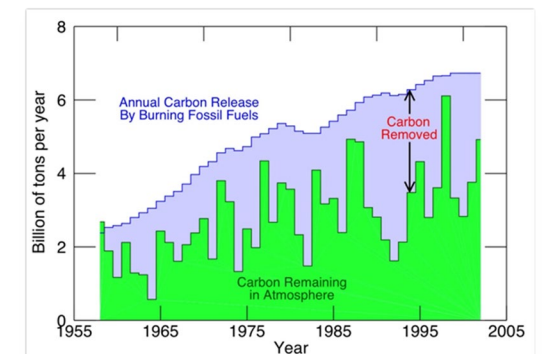

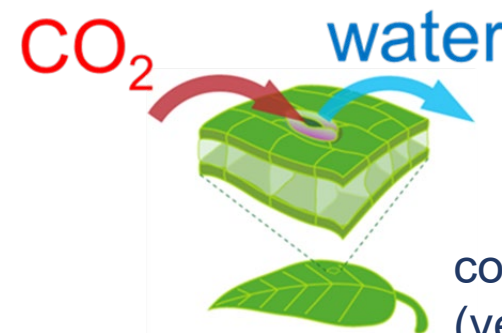

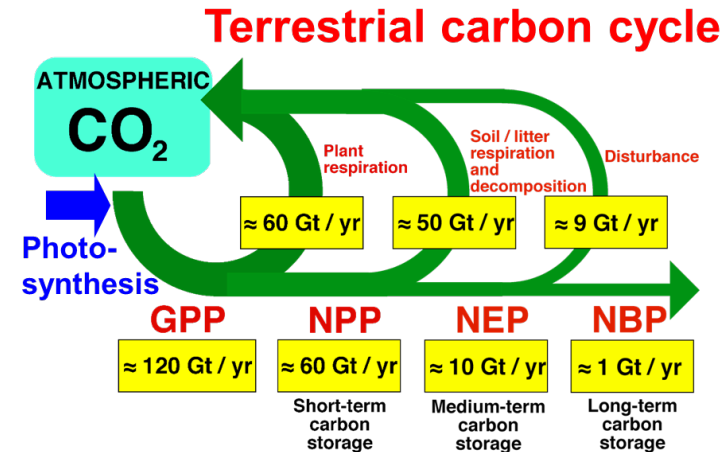

# Mission objectives

## Quantitative global mapping of actual photosynthetic activity of terrestrial ecosystems, accounting for the spatial and temporal variability driven by environmental conditions

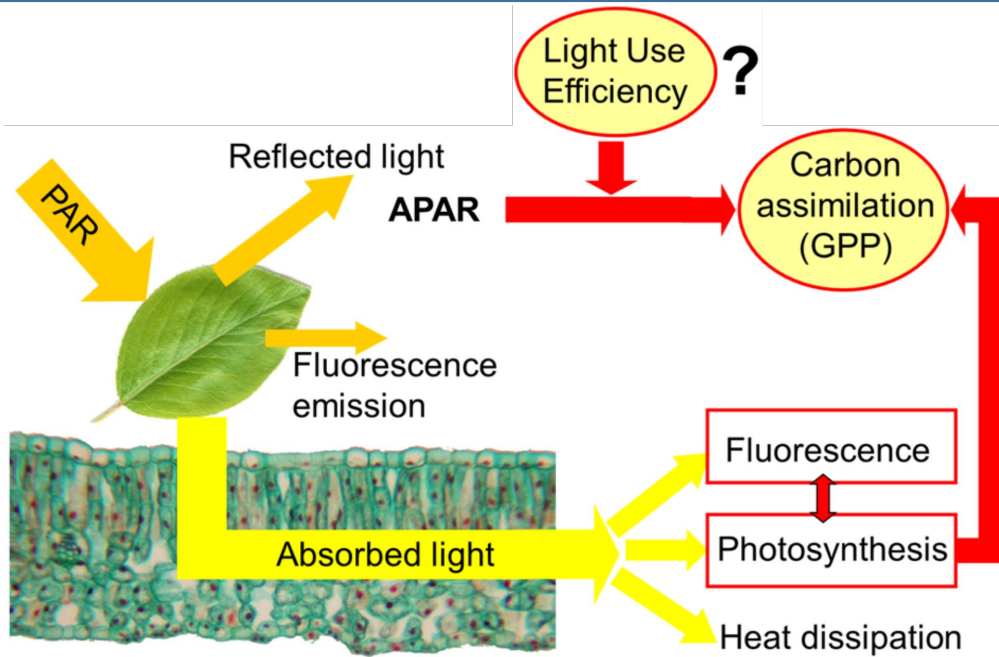

- Reduce uncertainty in global / regional estimates of carbon fluxes, in particular GPP (Gross Primary Productivity)
- Provide estimates of vegetation stress through variable photosynthesis rates (potential applications in agriculture / food security)

*The goal is to quantitatively understand the observed dynamics, to develop predictive models (physical, mechanistic), and then be able to forecast climate trends and vegetation adaptations with reduced uncertainty.*

coupling of carbon and water cycles (vegetation stress)

# Relevance of chlorophyll fluorescence emission for vegetation studies

large variability in the shape and amplitude of fluorescence emission

$$\int_{\lambda} F(\lambda) d\lambda$$

total spectral integral of whole fluorescence emission is what can be related to photosynthesis

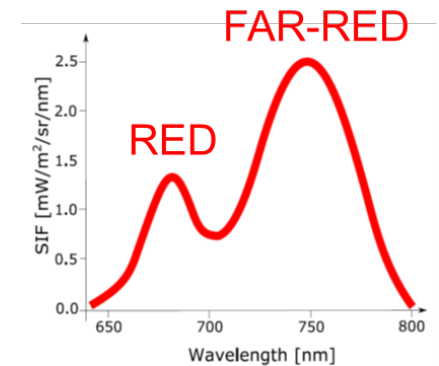

Look at the whole photosynthesis processes from the side of light reactions

# Information content of chlorophyll fluorescence

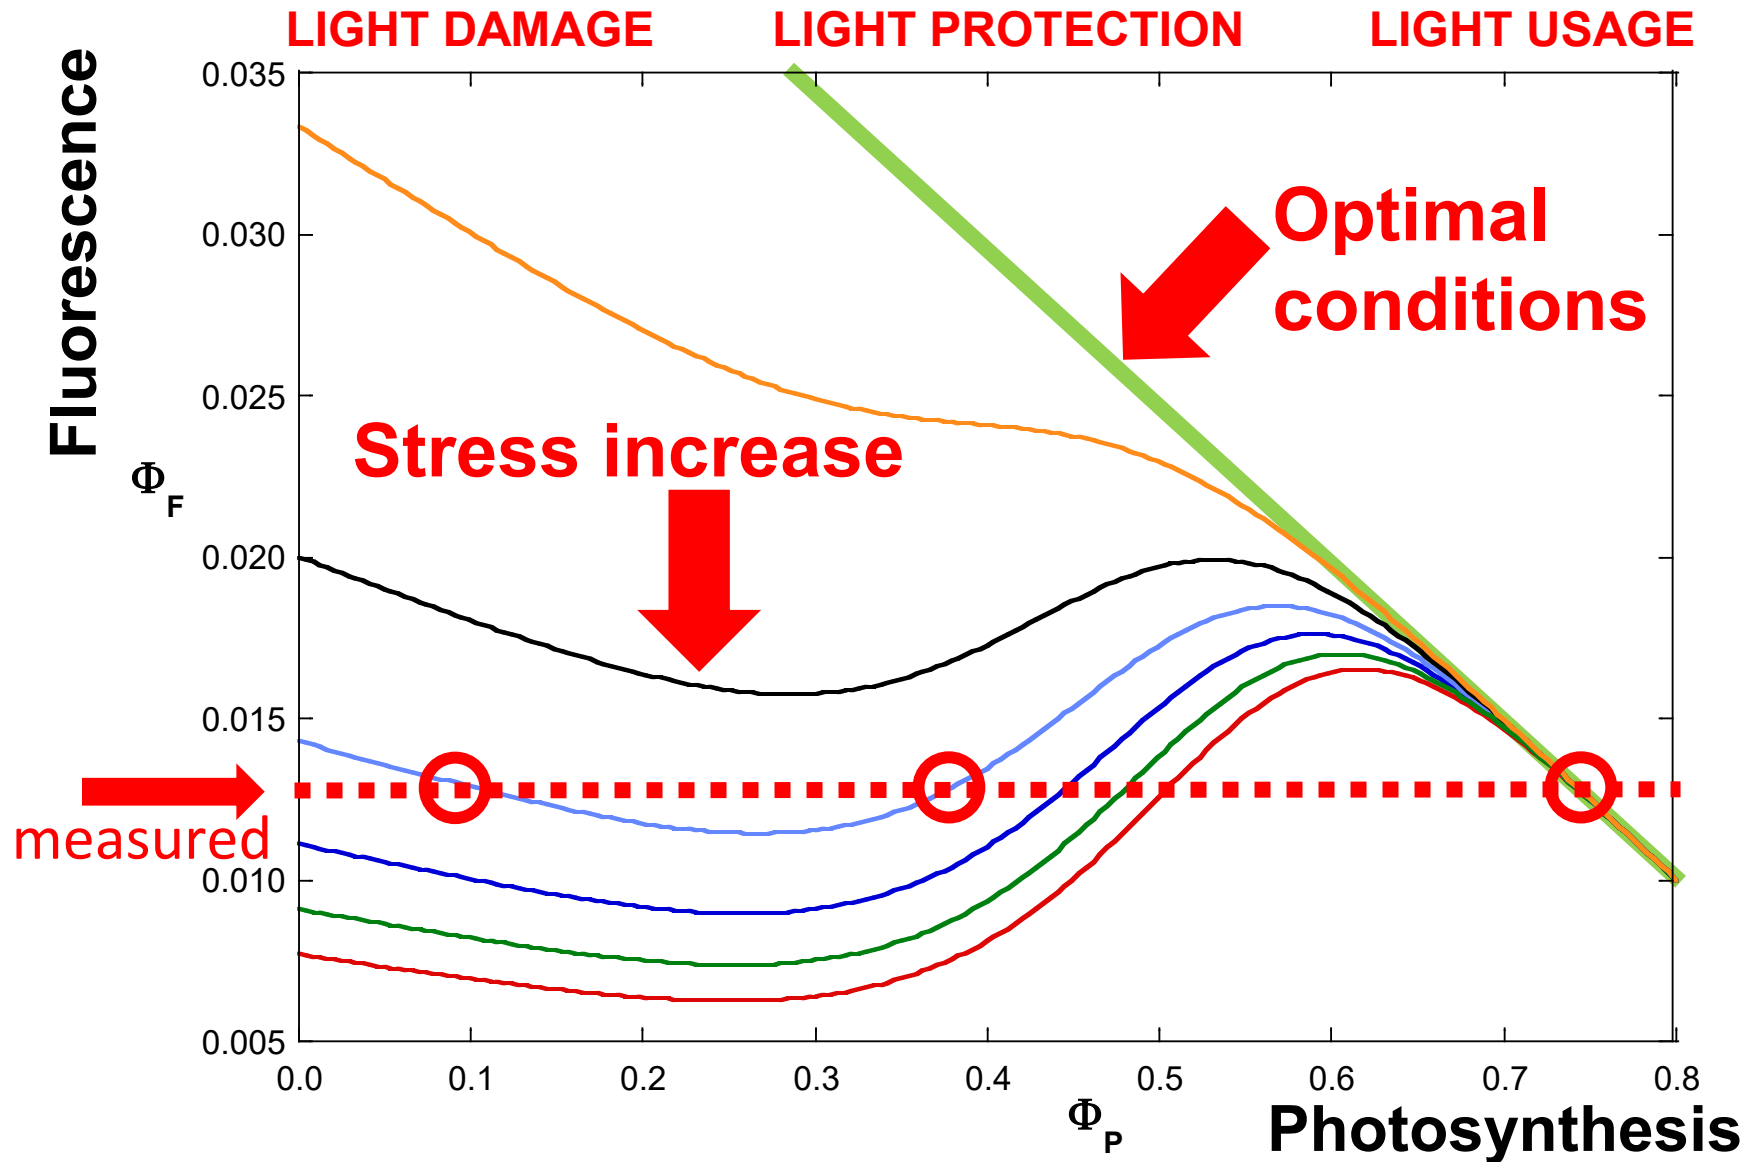

**Fluorescence emission is a kind of residual effect for the unused energy**

**PSI / PSII effects**

# The link between fluorescence and photosynthesis

$$\Phi_F \approx \frac{k_F}{k_F + k_D} (1 - \Phi_P)$$

*constant*

$$\Phi_F = \frac{k_F}{k_F + k_D} \frac{1 - \Phi_P}{1 + NPQ}$$

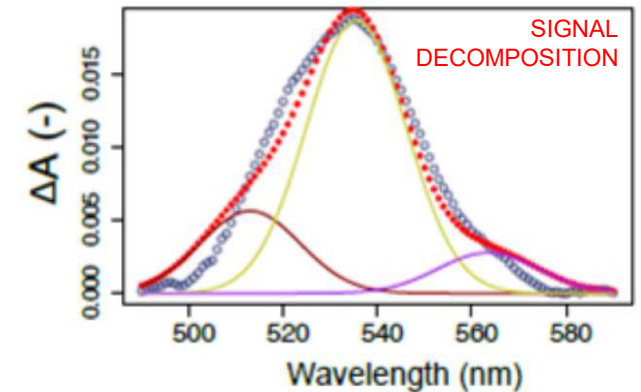

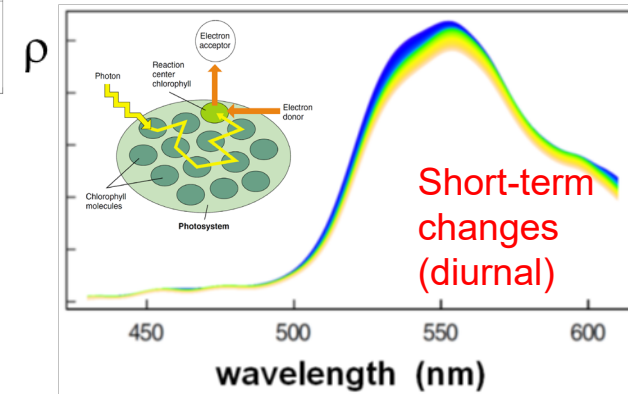

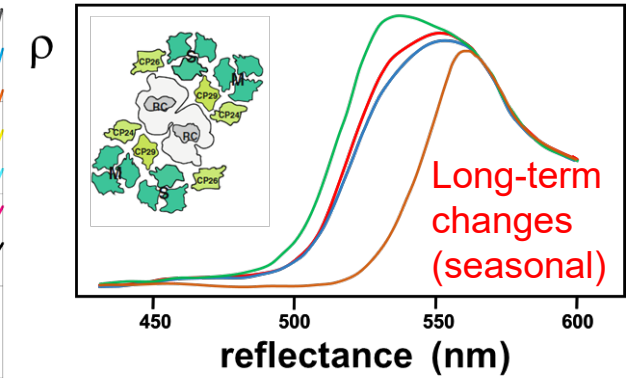

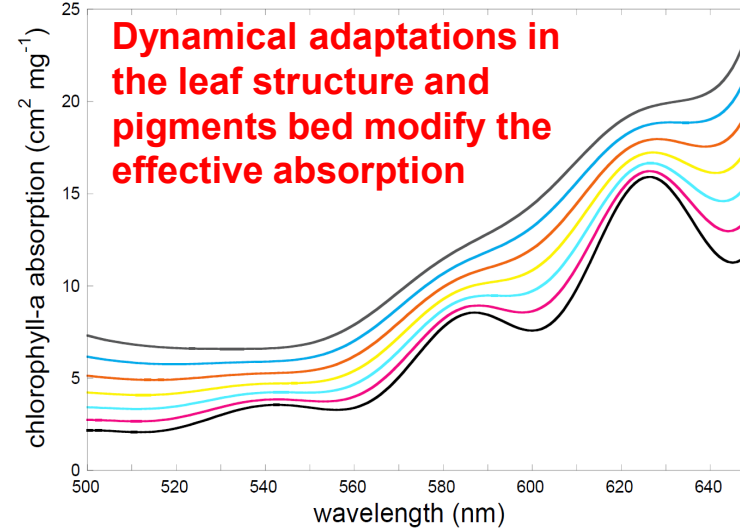

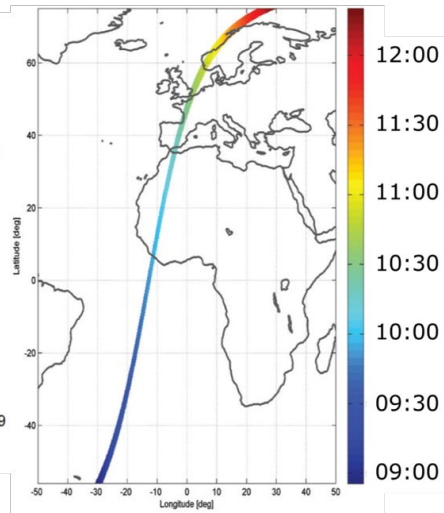

Additional information needed to disentangle the ambiguity

# Accounting for regulated energy dissipation (NPQ) along diurnal cycle

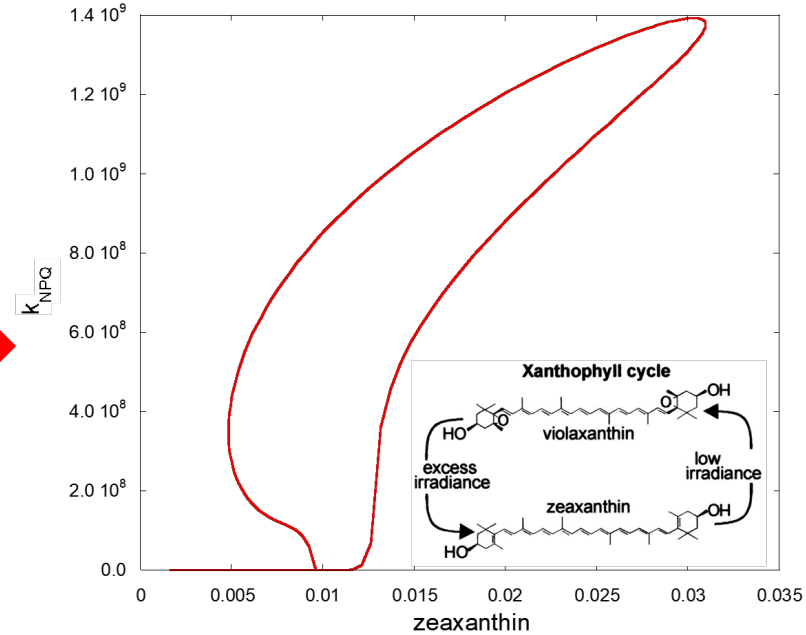

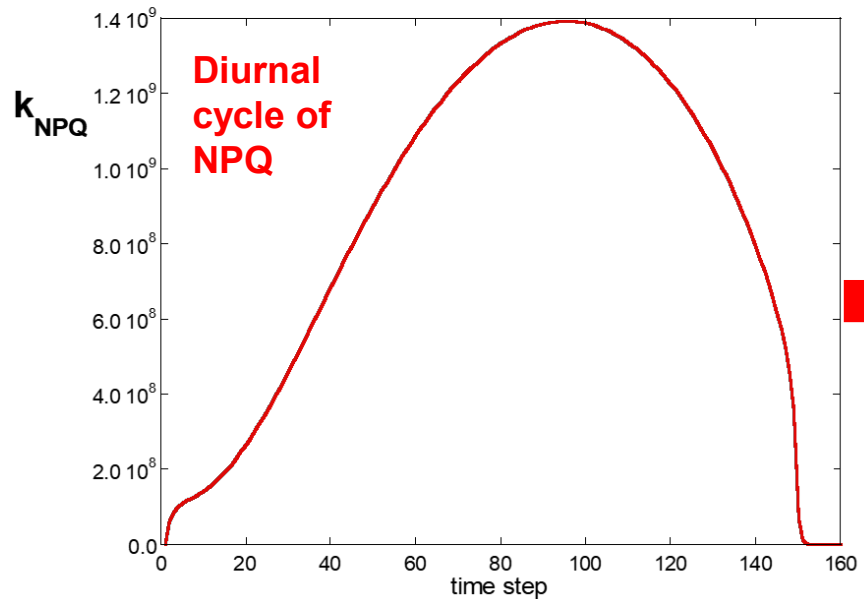

Diurnal cycle of  $\Phi_P$ ,  $\Phi_F$

FLEX observation time

Impact of local time of observation in the retrieval of dynamical variables

# Key information provided by FLEX

Main FLEX product:

for all wavelengths (spectral integration), for all emission angles (angular integration), corrected for reabsorption and scattering through canopy structure

$$\Phi_F = \frac{\text{total number of photons emitted as fluorescence}}{\text{number of photons absorbed by chlorophyll}}$$

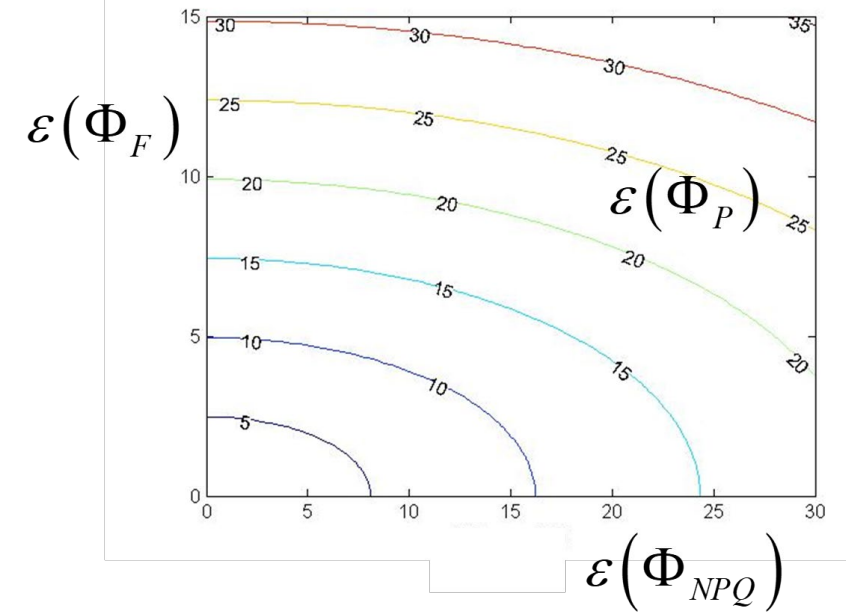

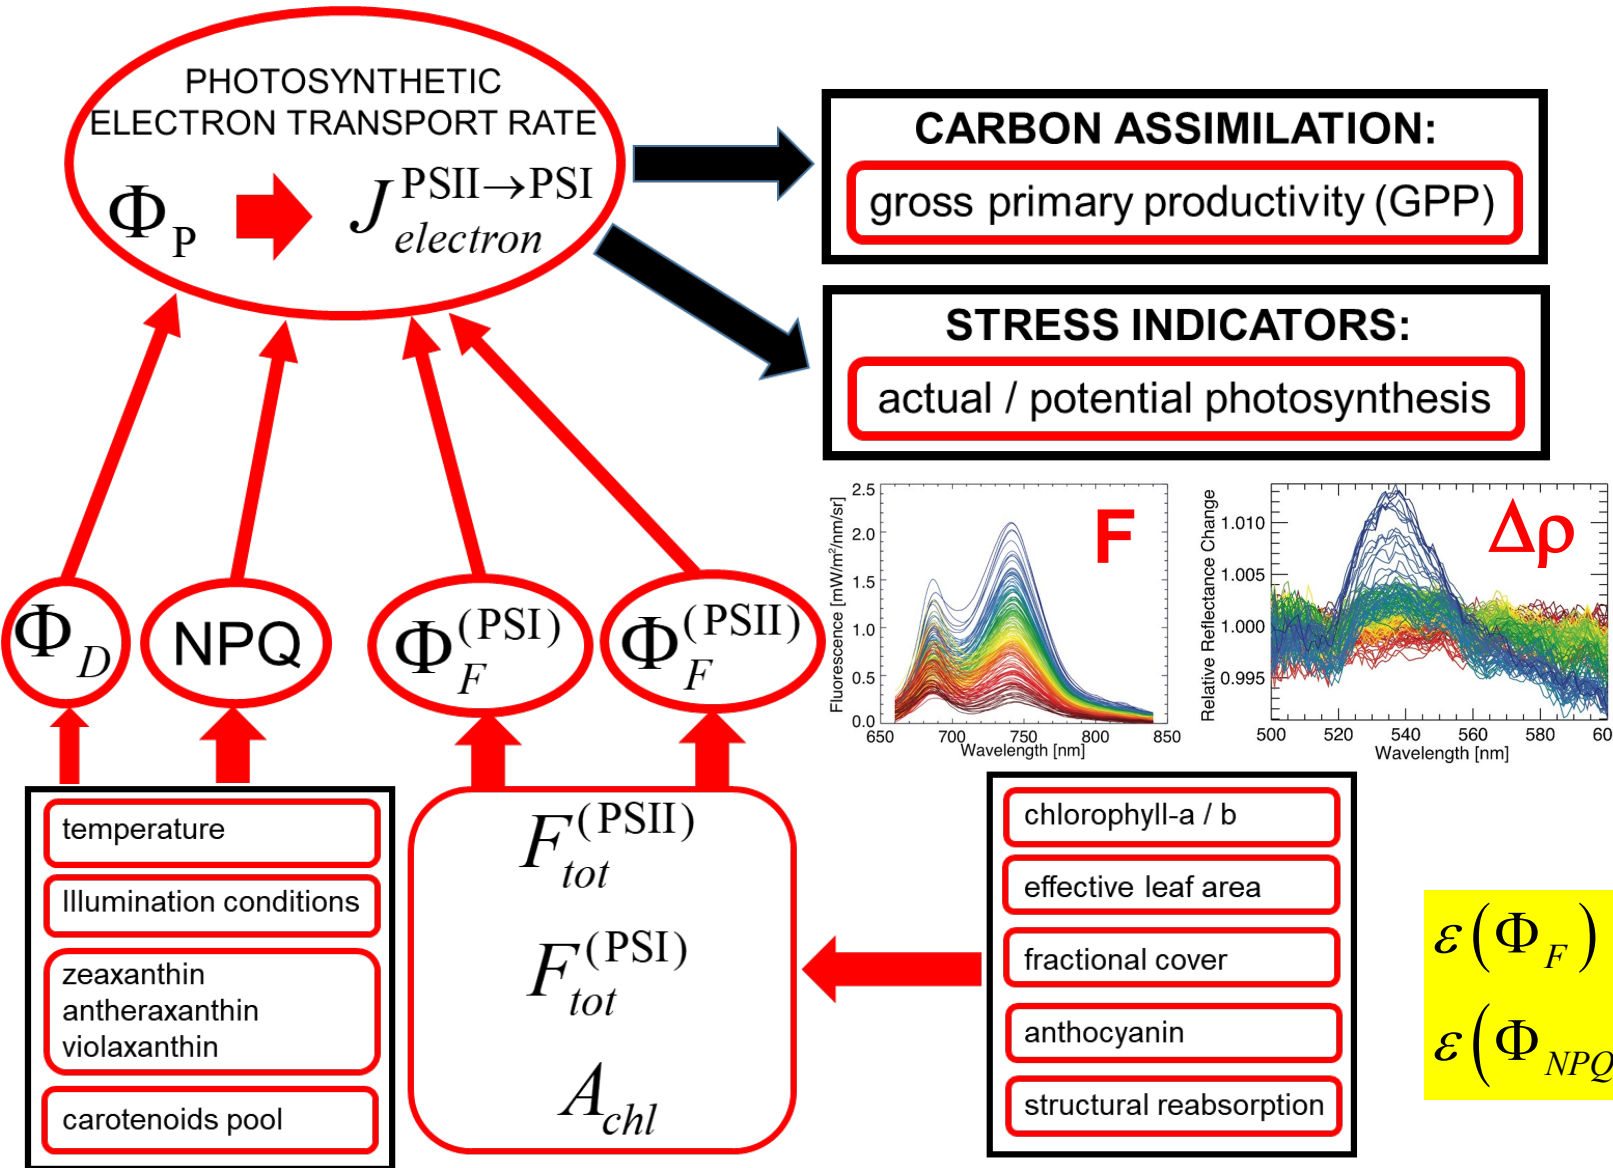

$$\Phi_F = \frac{k_F}{k_F + k_D + k_{NPQ}} (1 - \Phi_P)$$

total number of excited states (photons actually absorbed by chlorophyll and not by other material)

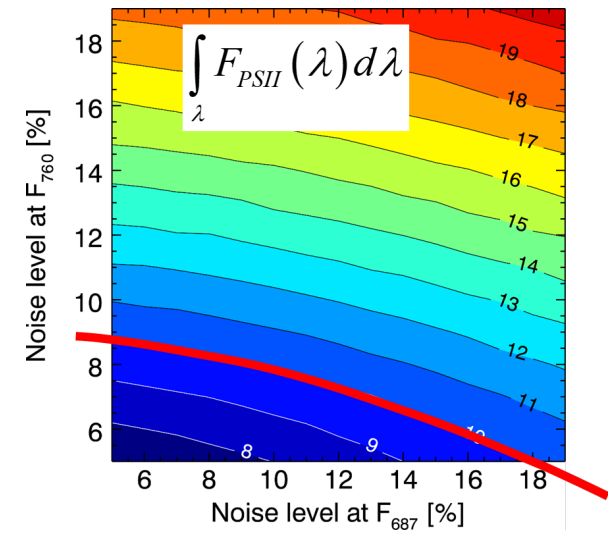

$\Phi_D \approx$  energy lost as basal (constitutive) heat dissipation  
 $\Phi_{NPQ} \approx$  energy lost as regulated heat dissipation (NPQ)

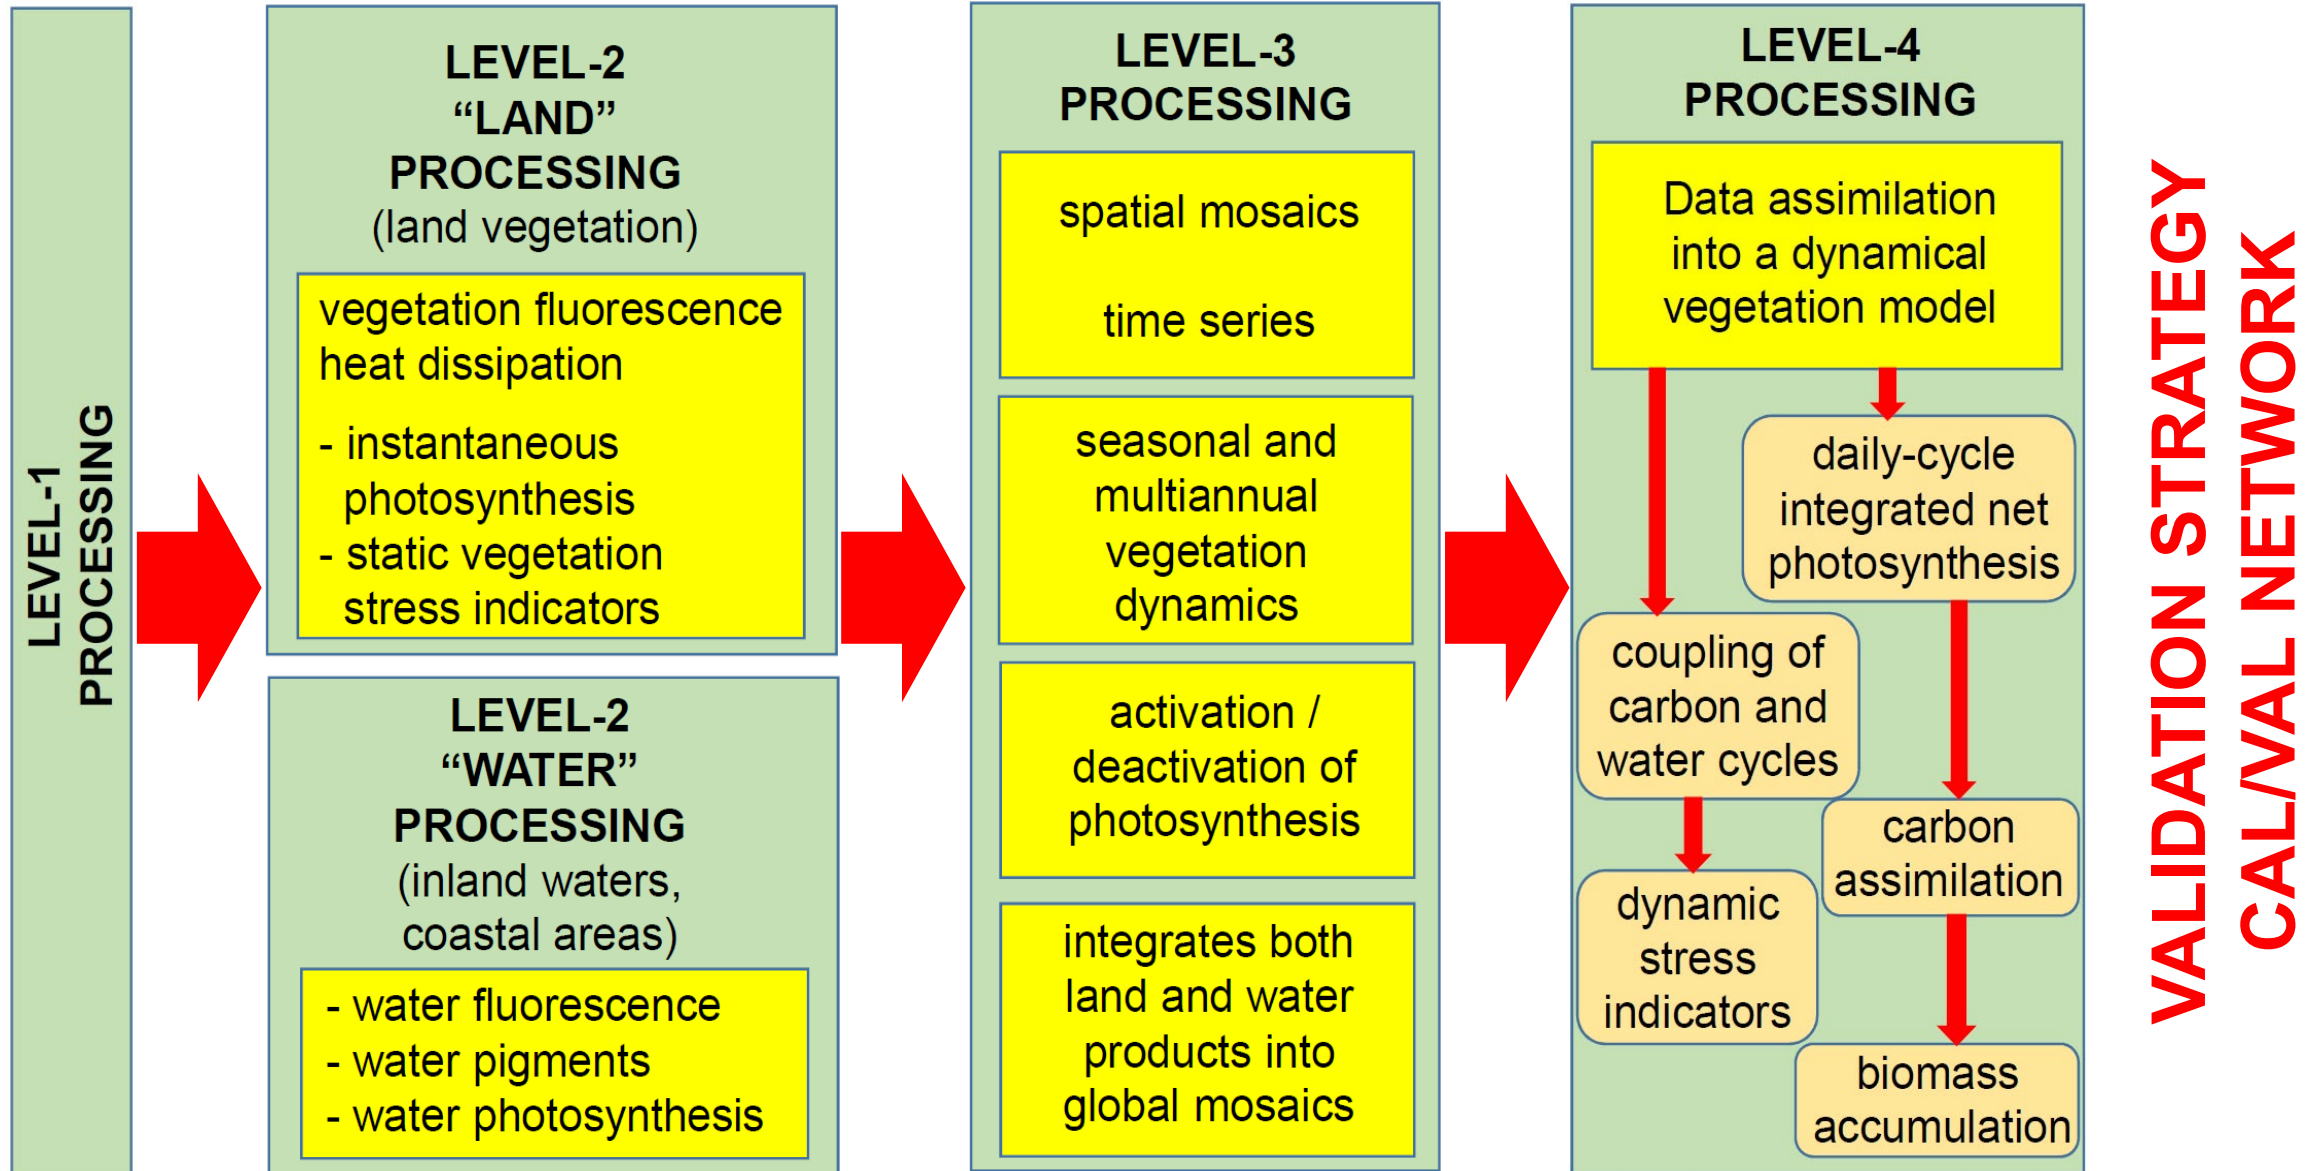

# Accuracy requirements in final output products and retrieval strategy

$\epsilon(\Phi_F) \leq 0.14$   
 $\epsilon(\Phi_{NPQ}) \leq 0.2 / 0.3$

# FLEX data processing strategy: from raw data to high-level products

# FLEX data exploitation plans

Full set of final high-level products available for end users  
*(ready to be incorporated in models and applications)*

**Analysis Ready Data (ARD)**

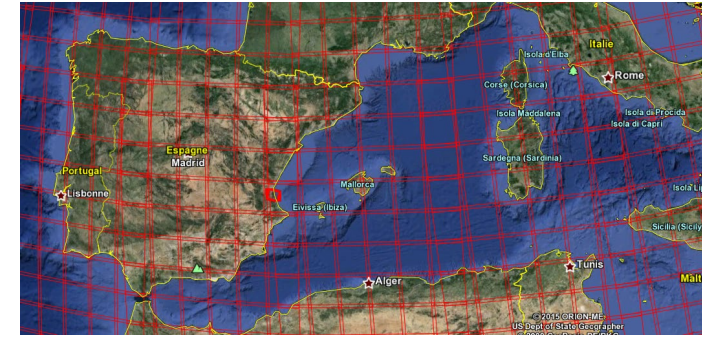

Initial set of TOA radiances and intermediate / raw products available for remote sensing specialists  
*(development of new algorithms, enhanced products, new applications)*

Multimission data exploitation:

- ✓ FLEX / Sentinel-3 by default in nominal L2 products
- ✓ Sentinel-2 for surface heterogeneity and scale analysis (L3/L4 products)

## Level-2 products

Provided in Sentinel-2 UTM Tiling Grid to facilitate combined exploitation with other missions

## Level-3 /-4 products:

Provided in Adapted Mercator projection to optimize global data analysis and assimilation into global models

## Product uncertainty (confidence interval)

- ✓ Full **covariance matrices**, rather than single product uncertainty
- ✓ **Montecarlo** error propagation
- ✓ **Statistical distribution** associated to each product

random                      systematic

↓                                      ↓

$$\mu_F = \left\langle \bar{F} \right\rangle_{-\delta_\alpha^{(-)}}^{+\delta_\alpha^{(+)}} \pm \Delta_{sys}^{(F)}$$

Confidence interval for each product

## Final remarks

- ✓ Well defined **objectives**, quantification the role of vegetation in the carbon cycle
- ✓ Advanced **retrievals methods** to separate the small signal from the background
- ✓ High-level **science products**, ready to be used in models and applications: robust **uncertainty** estimates, quantitative product **validation**
- ✓ Multi-mission exploitation (FLEX / Sentinel-3, Sentinel-2, +other sources)
- ✓ Availability of open-source free-access data exploitation tools to promote further usage of the data

*...getting ready for launch in 2025.*
