Living Planet Symposium 2022
B1.04.1 FLEX validation status and plans
Wed 25th May 11:40–11:55

Fig. 1: Tandem mission of FLEX and Sentinel-3 with planned launch of FLEX in 2024 taken from Drusch et al. 2017

Fig. 2: Band distribution of FLEX and OLCI taken from Drusch et al. 2017

- Summer 2018: Tandem mission of Sentinel-3A and -3B during S3B commissioning phase
- for 24 acquisition scenes OLCI-B was programmed to mimic FLEX
- Reprogrammed OLCI-B has 45 bands within 500-800 nm with FWHM between 1.7 nm and 3.7 nm
- Part of Atmoflex and FLEXsense project

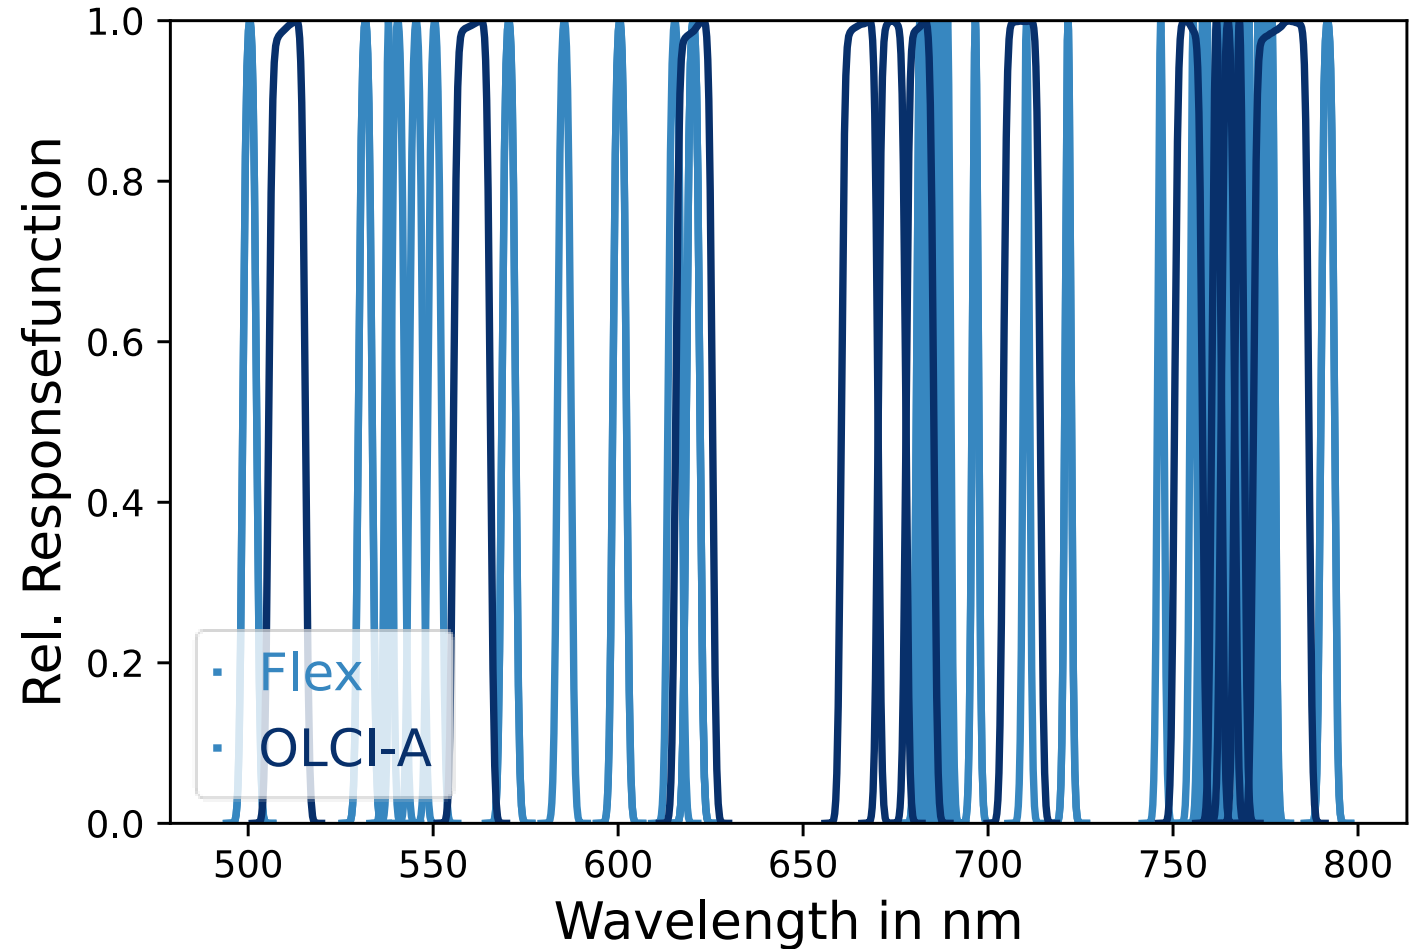

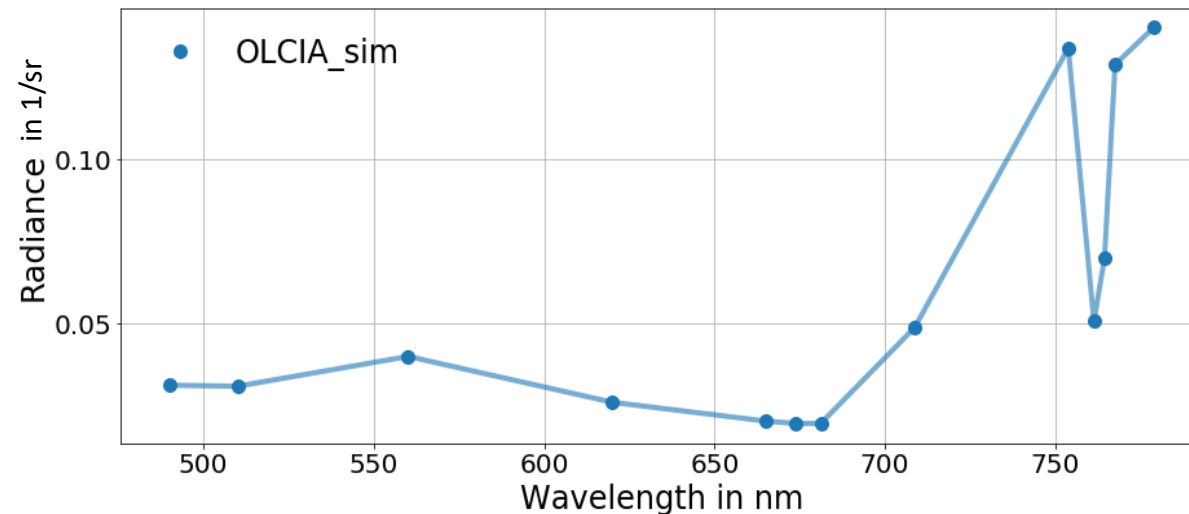

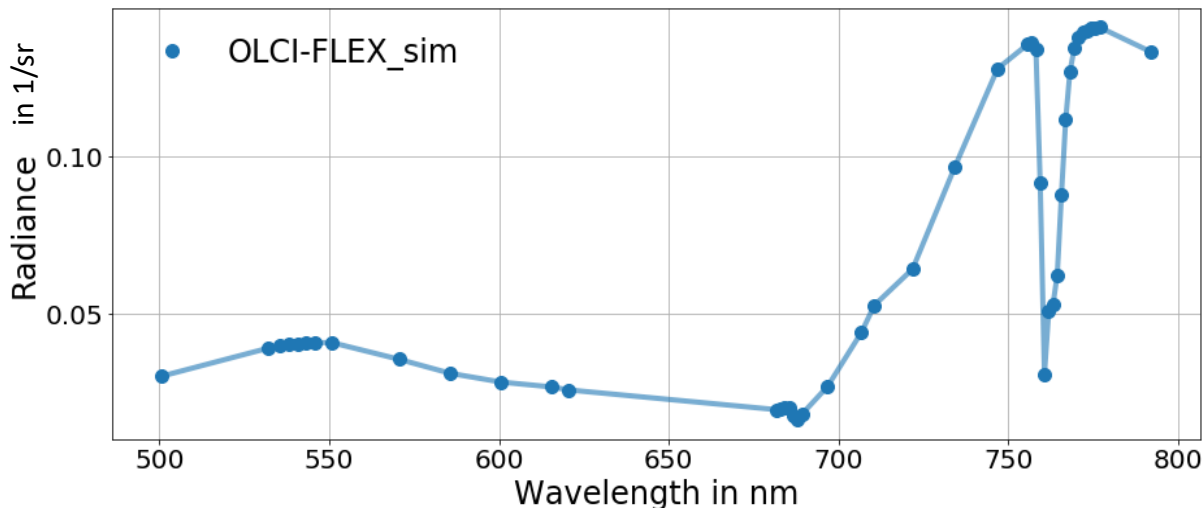

Fig. 3: Relative response function of OLCI-FLEX (light blue) and OLCI-A (dark blue) showing the band distribution and the FWHM

Instrument 1

Instrument 2

Find state of atmosphere and surface that explains measurement of instrument 1

Transfer atmosphere and surface parameter to settings of instrument 2

Forward simulate measurement of instrument 2

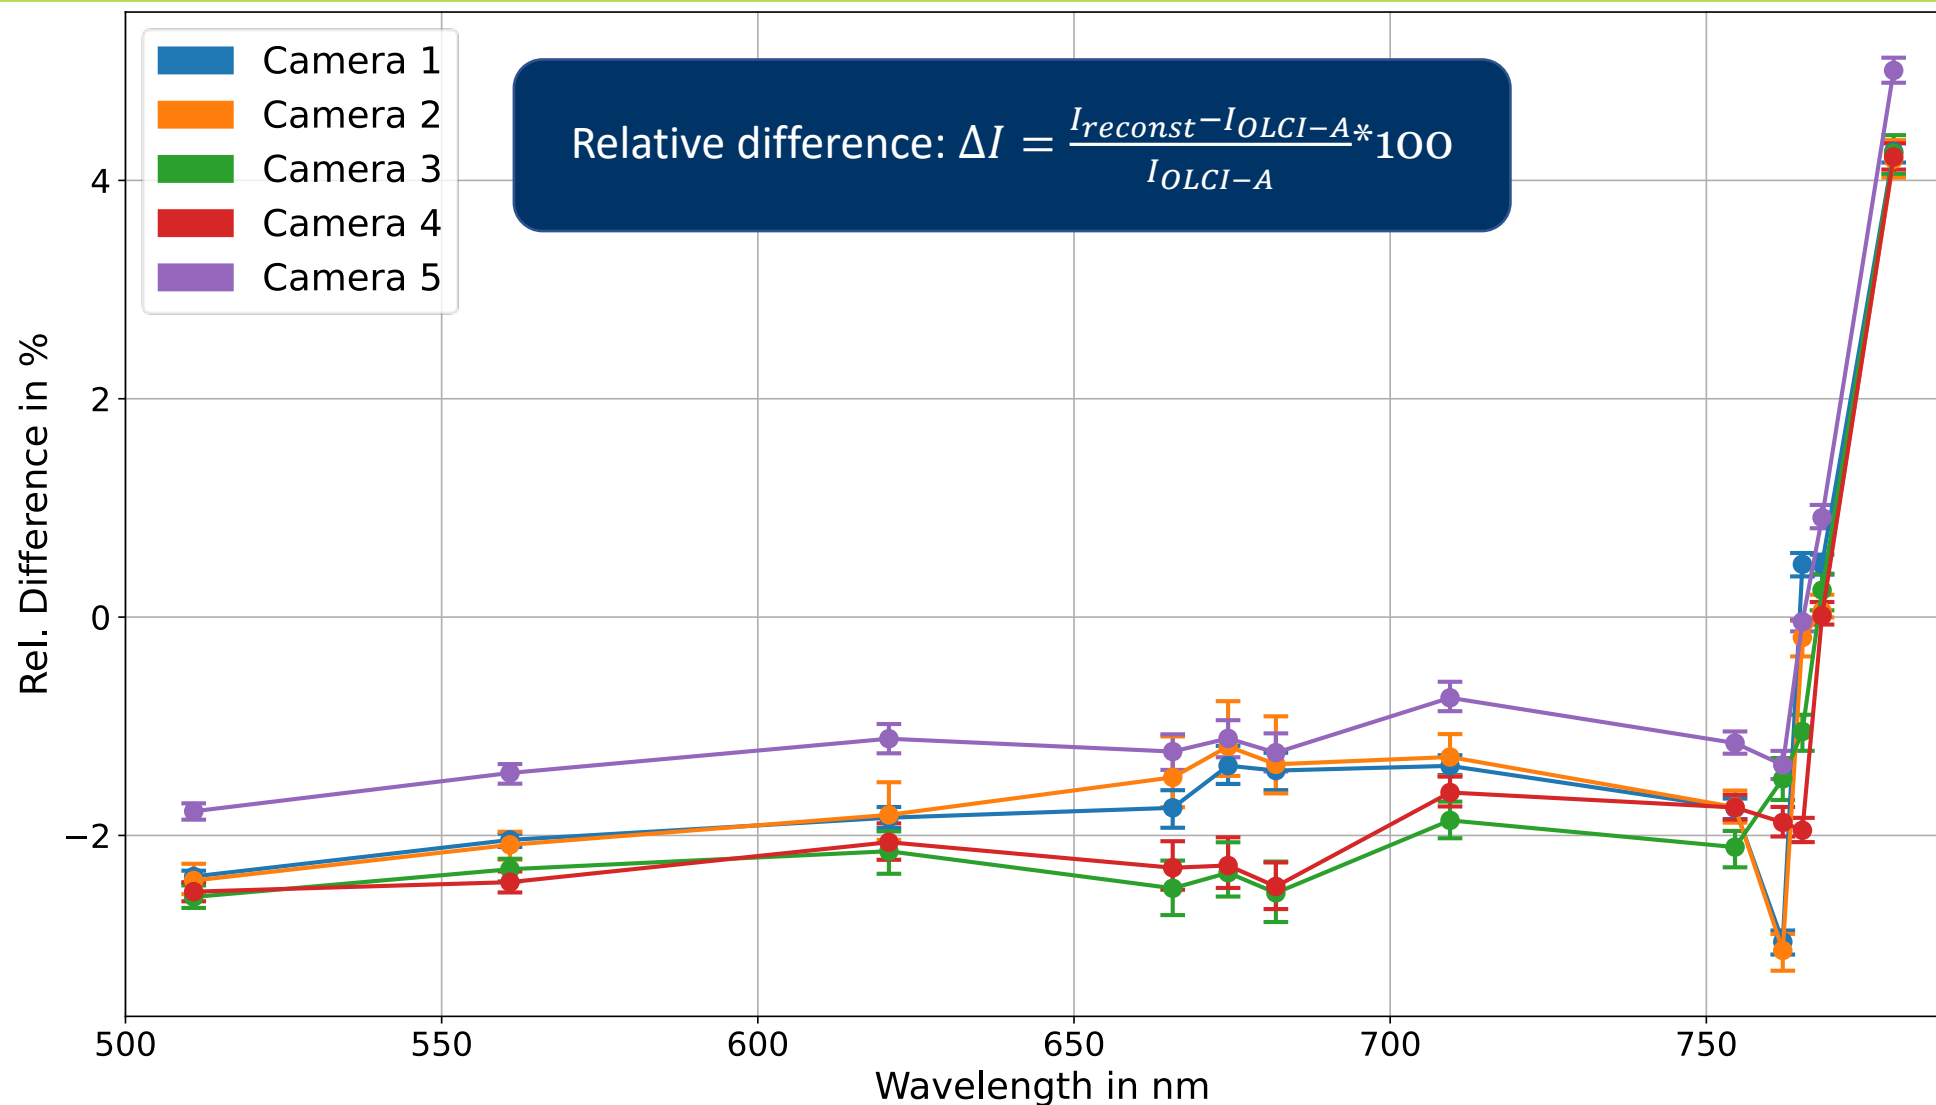

Fig. 3: Median rel. difference for each camera of one acquisition scene (02/07/2018). Data set for each camera about 200 000 pixel.

OLCI-FLEX about 2 % darker than OLCI-A
 → absolute calibration

OLCI-FLEX about 5 % brighter
 → e.g. processing of OLCI-FLEX L0-L1

Oxygen absorption band: band characterization important

Lack of information in vegetated surface reflectance
 → additional information (PCR) for FLEX won't be necessary

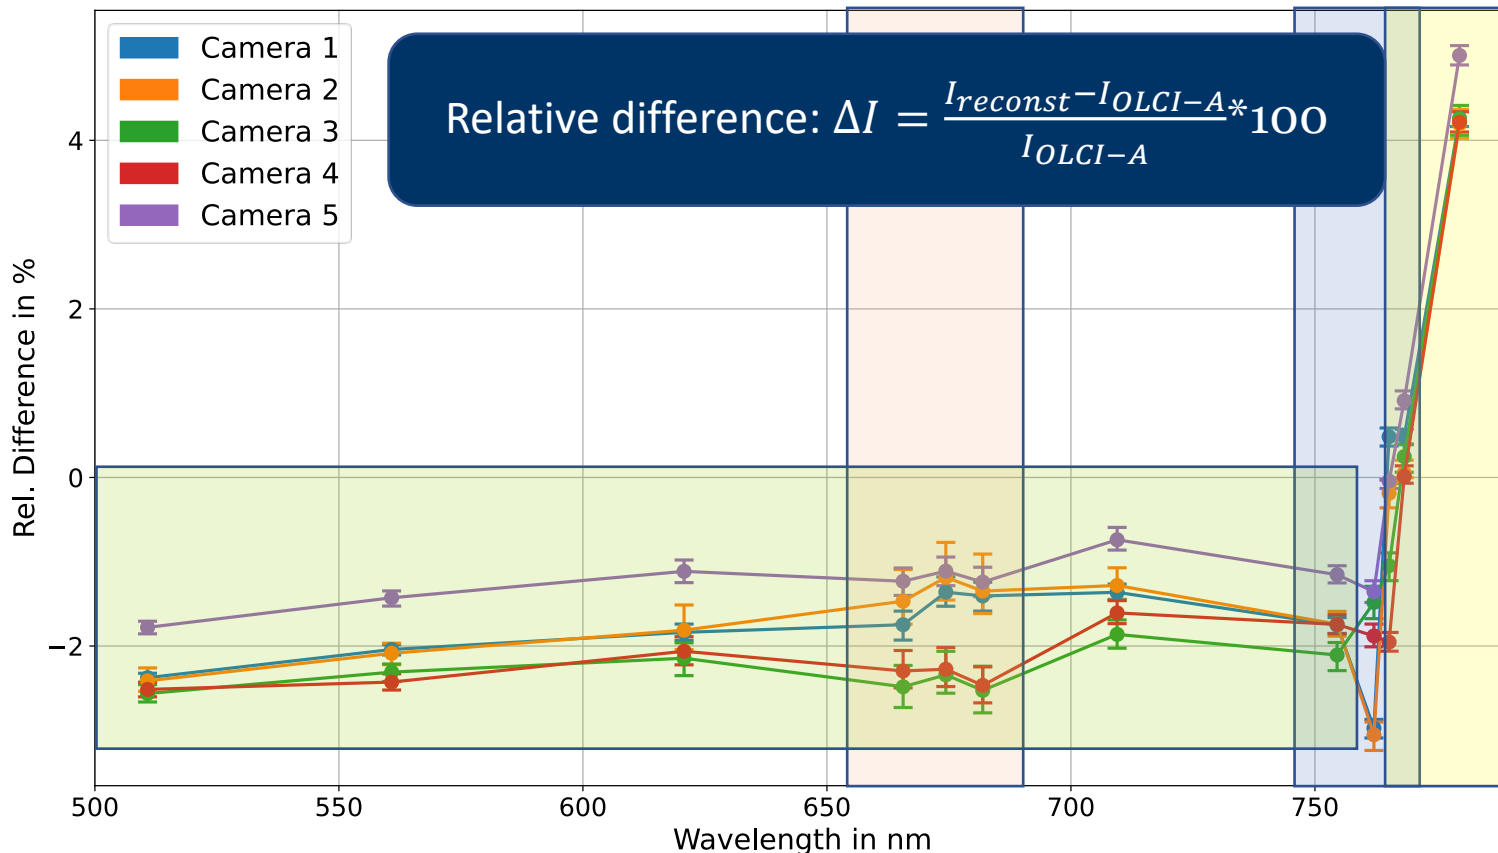

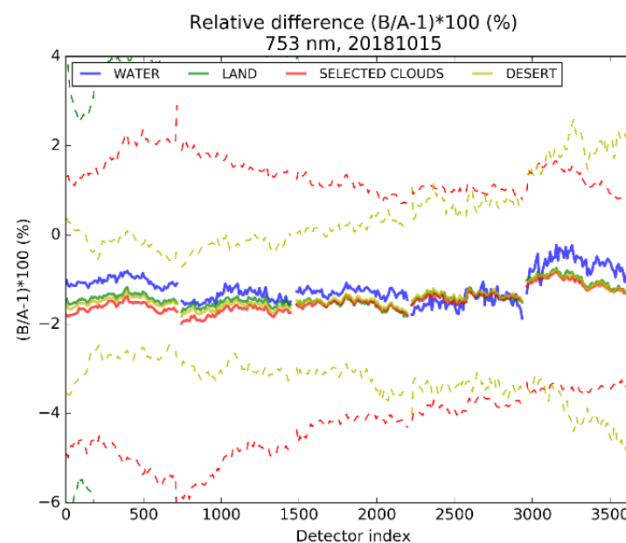

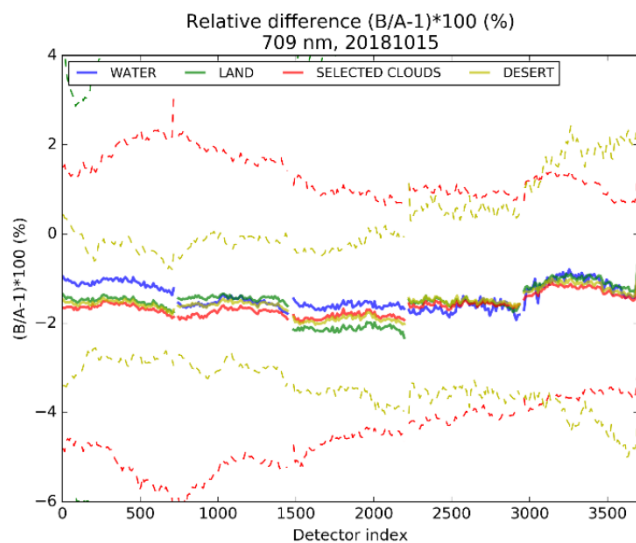

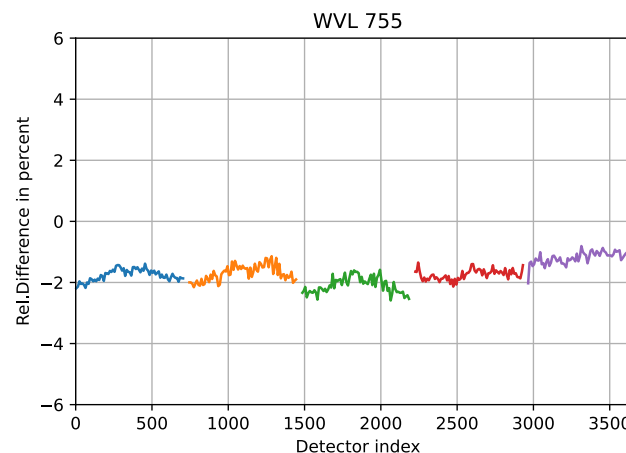

Fig. 3: Median rel. difference for each camera of one acquisition scene (02/07/2018). Data set for each camera about 200 000 pixel.

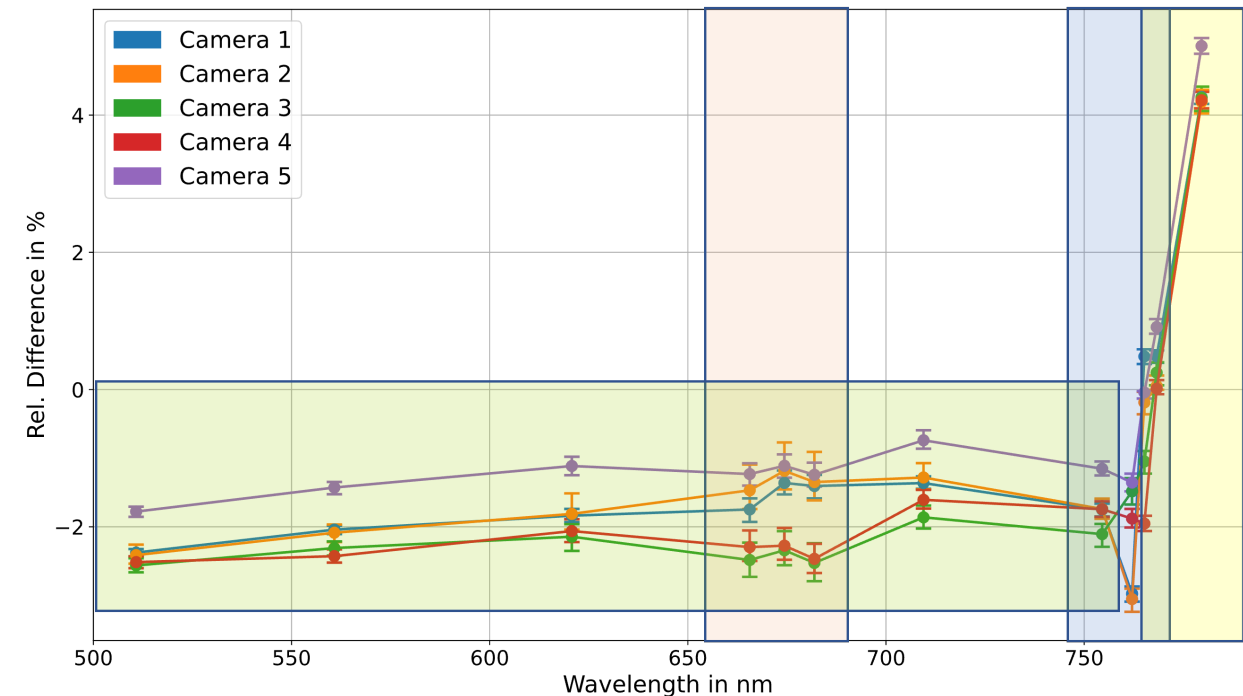

Lower figures from *Lamquin, N., Clerc, S., Bourg, L., & Donlon, C. (2020). OLCI A/B tandem phase analysis, part 1: Level 1 homogenisation and harmonisation. Remote Sensing, 12(11), 1804*

Main outcome:

- Transfer function is sensitive to calibration and other errors
- measurement errors found for Sentinel 3 tandem mission in FLEX mode
- method validated

Lessons learned:

- surface reflectance must be well characterized
- O2 band characterization

- Comparison: Satellite-based vs. Ground-based
→ OLCI-FLEX vs. FLOX

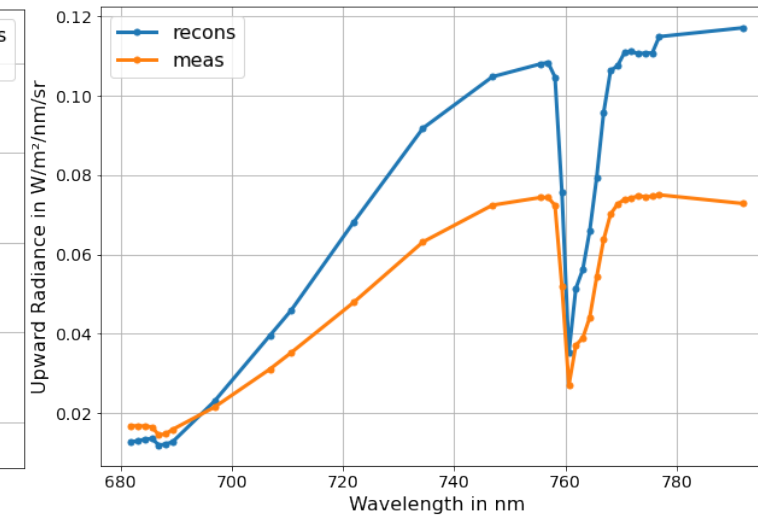

- Comparison Satellite-based vs. Aeroplane vs. Ground-based
→ OLCI-FLEX vs. Hyplant vs. FLOX

- Comparison of ground-based and satellite based instruments:
 - information from TOA measurement are used to forward simulate BOA downwelling and upwelling radiance
- Application to FLOX showed only downwelling radiance can be used for comparison due to strong dependence on surface reflectance

- Different instruments have different size of observation area
- measurement of surface reflectance is measured over those areas
- with inhomogeneity surface reflectance differs

With Hyplant difference can be quantified by comparing single pixels with average over 100x100 pixel

S3 OLCI-FLEX

300 x 300 m

FLOX

30 x 30 m

1 x 1 m

Hyplant

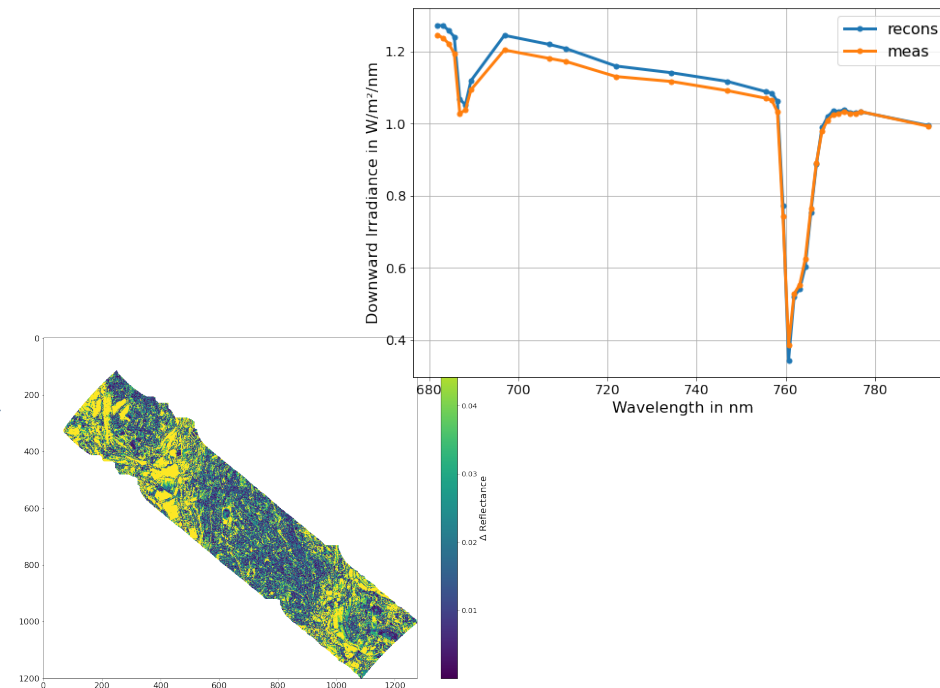

4.5 x 4.5 m

450x 450 m

South France (Observatoire de Haute-Provence) on 10/07/2018:
 Δ Reflectance = Reflectance 450x450 – Reflectance 4.5x4.5

- Transfer function is sensitive to calibration and other errors
- FLOX downwelling BOA radiance validates atmospheric correction
- aeroplane data (Hyplant) can be used to study inhomogeneity/representativity of surface reflectance

Thank you for your attention.
