TAKING THE PULSE
OF OUR PLANET FROM SPACE

Integration of open-source intelligence (OSINT) with EO image intelligence (IMINT) for security applications

Experiences in ESA project EO Law

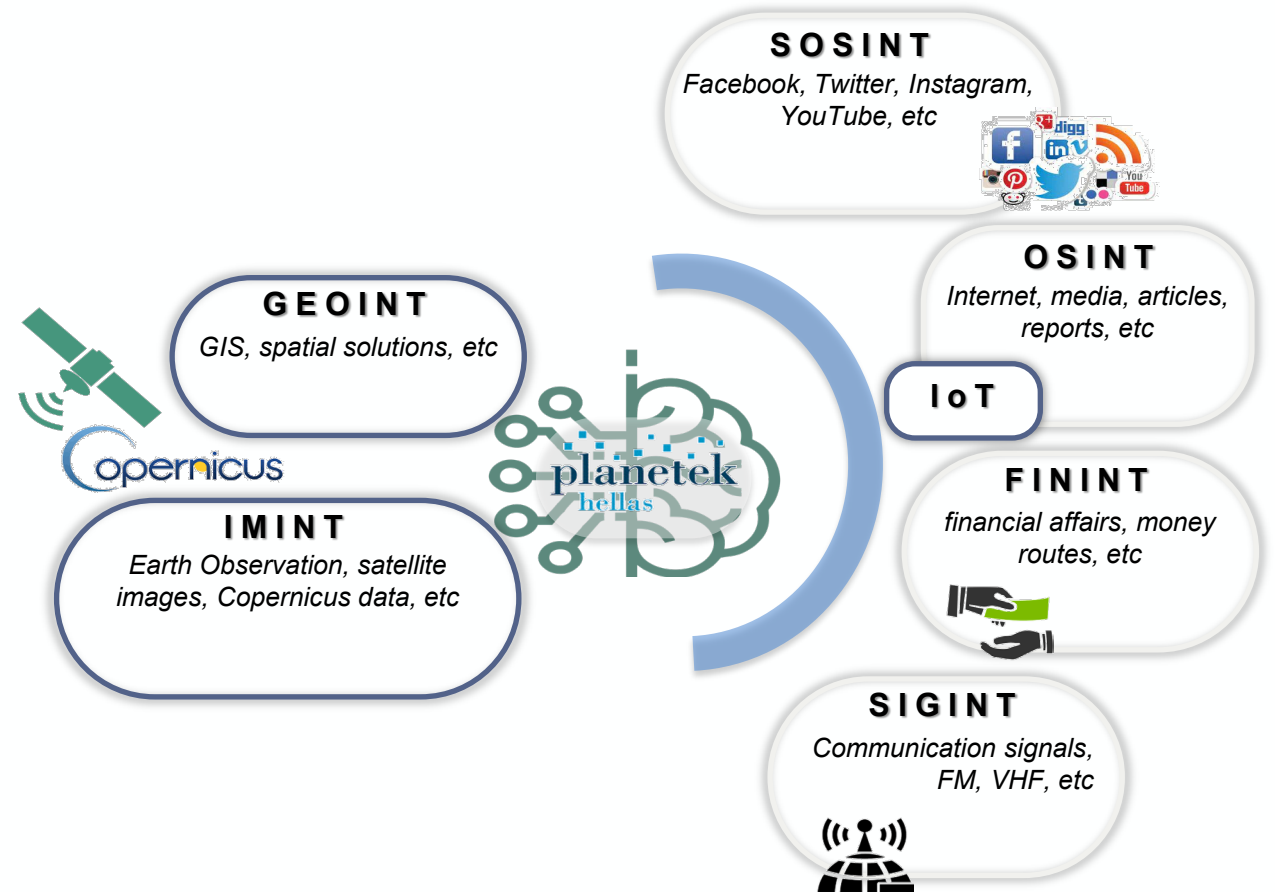

Ioannis Kotaridis | Planetek Hellas EPE | Greece
Dimitrios Ioannidis | Planetek Hellas EPE | Greece
George Benekos | Planetek Hellas EPE | Greece
Kleanthis Karamvavis | Planetek Hellas EPE | Greece
Michela Corvino | ESA - ESRIN | Italy

Goals:

Spatial visualization of abnormal activities related to security applications

Identification of patterns and changes in areas of interest

Fusion of multi source data, including GIS data, Earth Observation imagery, structured and unstructured data, databases as well as information from media and open sources

**Service 1: Comprehensive and Contextual Imagery Intelligence Analysis
Combining EO Data and Media Sources**

Service 2: Hotspot Detection Layer with Potential Training Camps

Service 3: Hotspot Detection Layer with Potential Abnormal Activities Related to security

Border Situation Greece – Turkey: March 2020

Detonation in Beirut: August 2020

Mali insurgency: February 2021

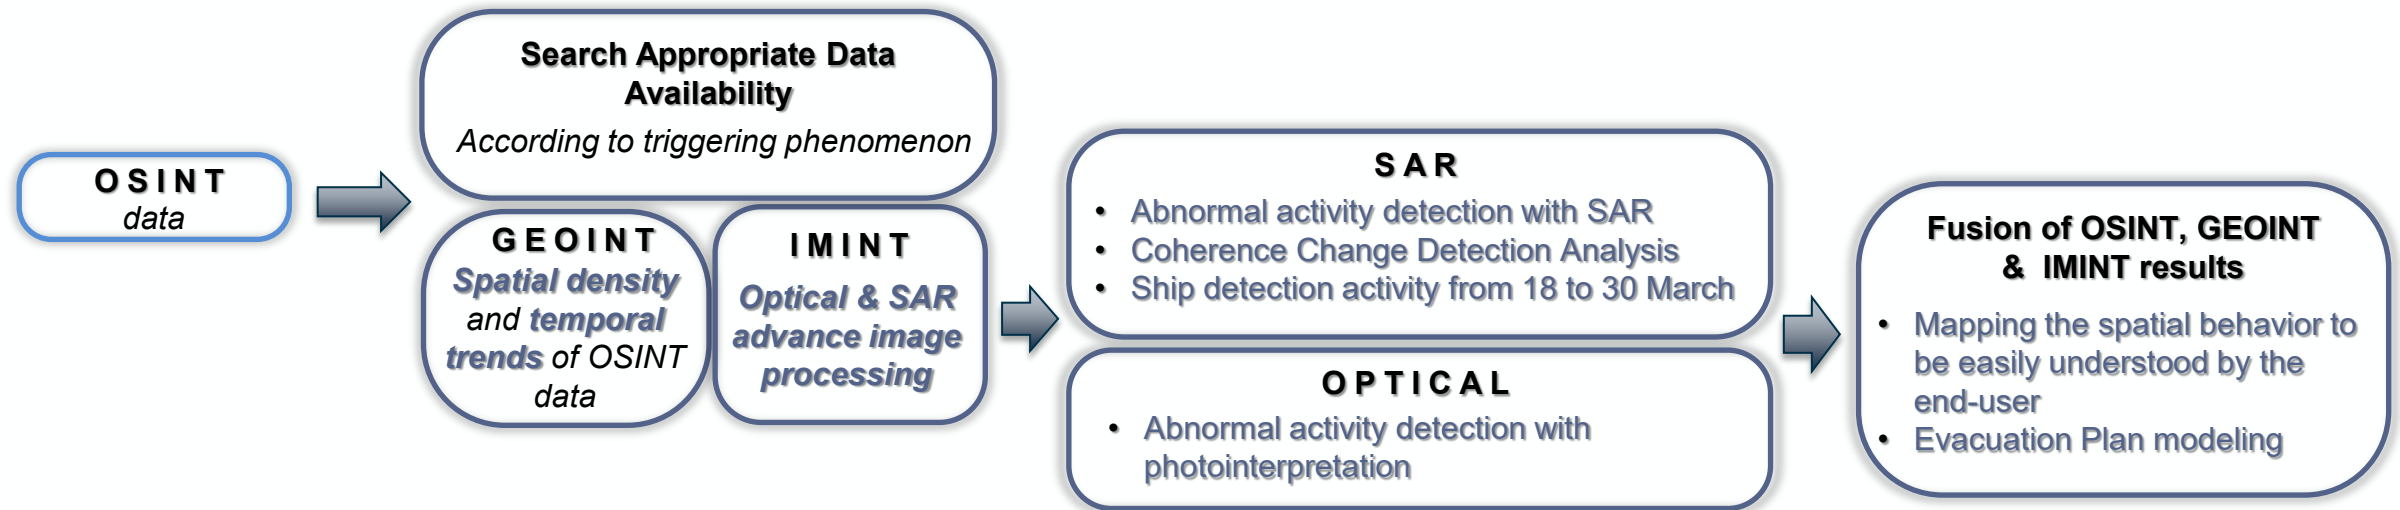

Mozambique insurgency: March 2021

Support to HOTSPOT Project Activities in Albania

FACT Activities in the Border Area of Libya and Chad

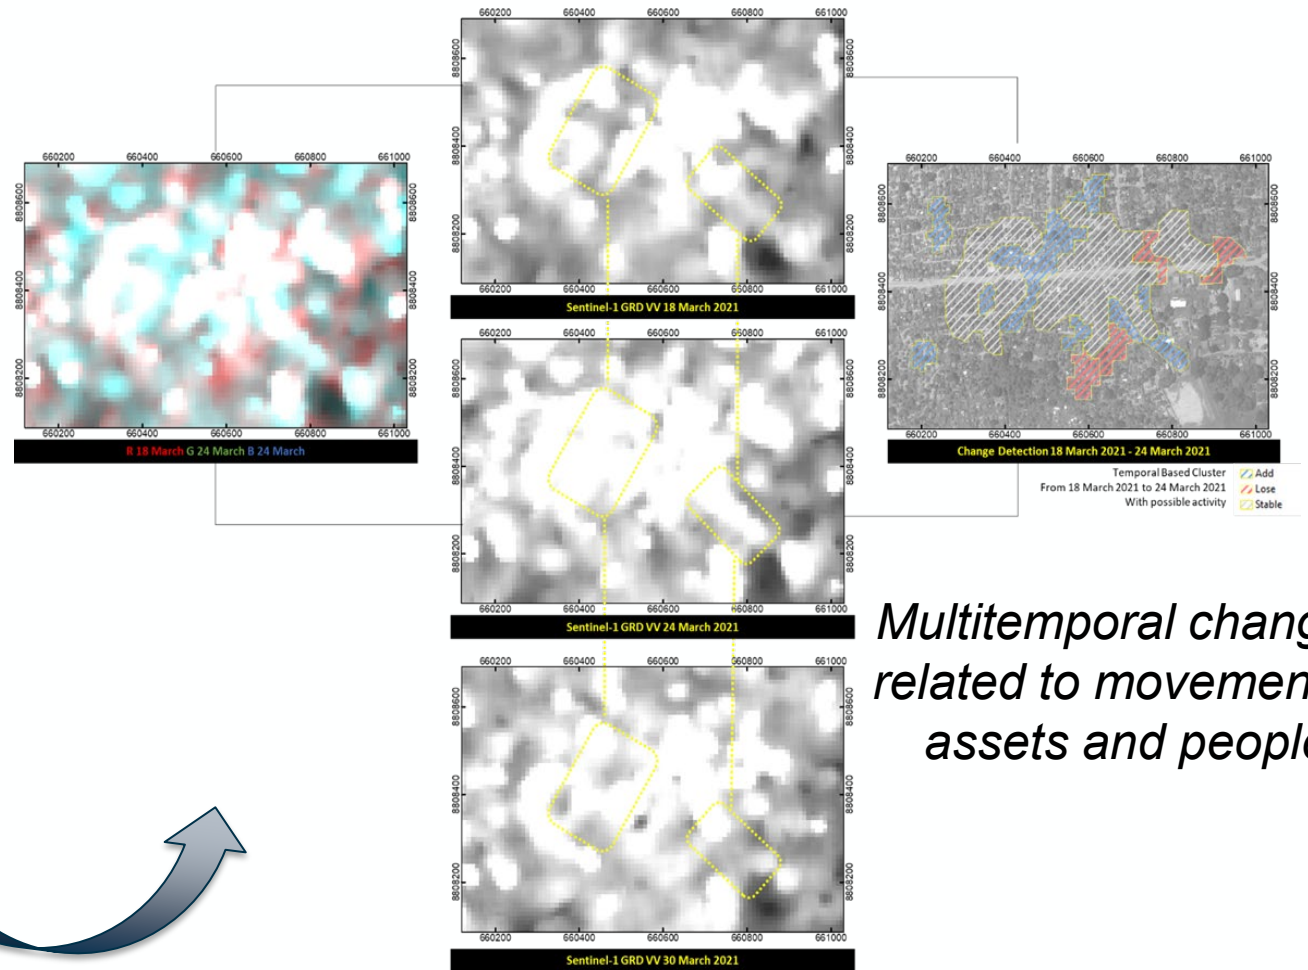

- Comprehensive and Contextual Imagery Intelligence (IMINT) Analysis combining EO Data and Media Sources (OSINT) for the Mozambique attack

Stakeholder	NGO, UN, Local security agency
Objective	Analysis of the situation on the ground in Palma, Mozambique, and offer strategically valuable insights about the militant group.
Services and products	Service 1 + Damage assessment + Evacuation plan + Ship detection analysis
Technical advancement	IMINT analysis + GEOINT analysis
Capacity building/training	Demonstration of the results
Added value/impact	Identification of movement of assets, identification of safe routes, detection of locations where battle action has taken place, IDP settlements
Outputs	Reports, spatial data, maps, satellite data

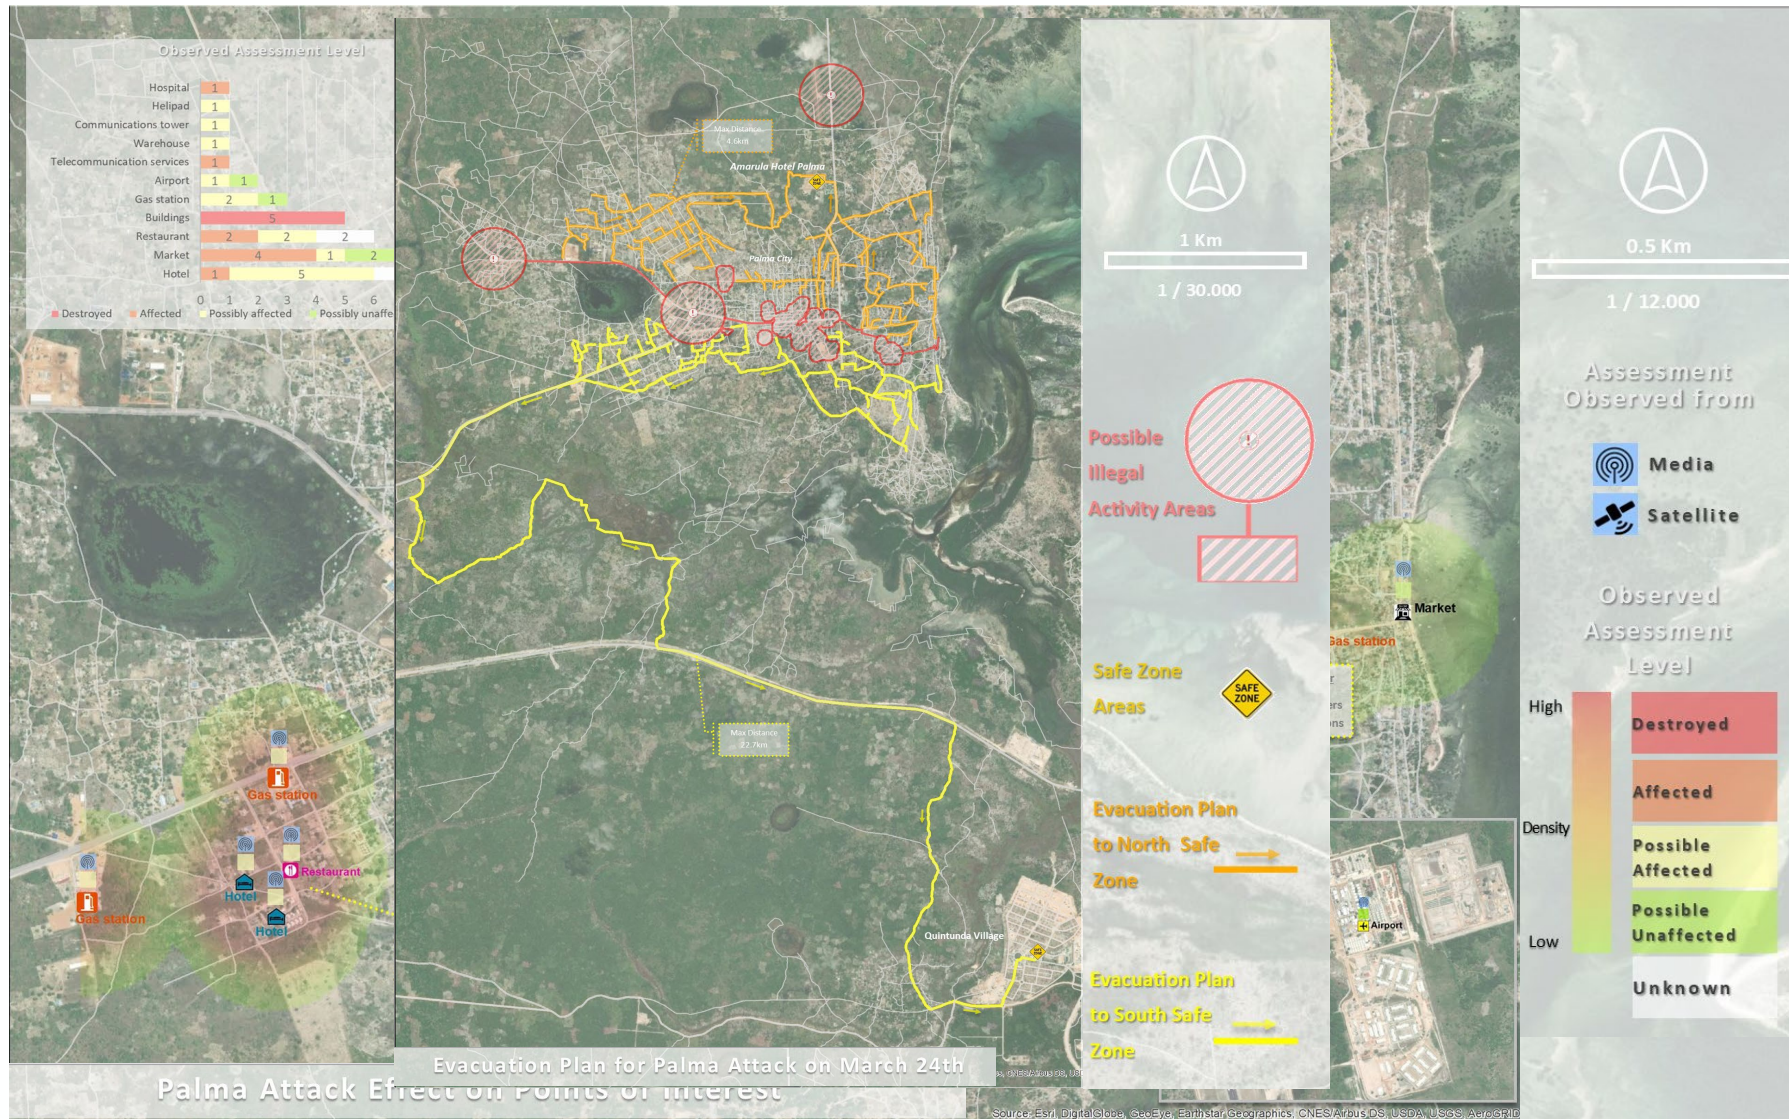

Automatic collection of relative video scenes from media news

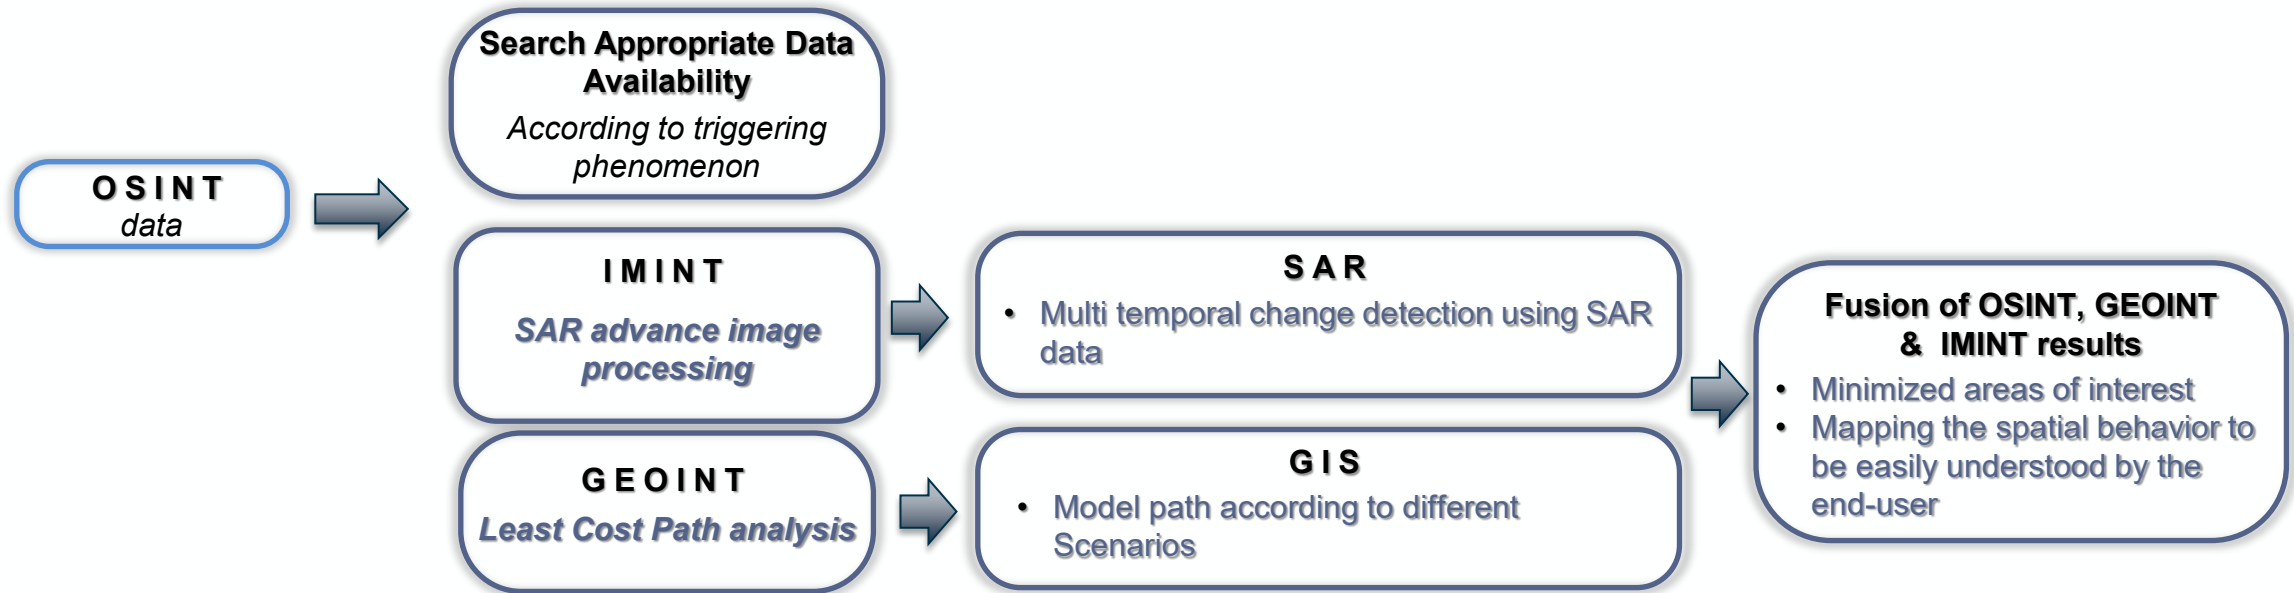

Multitemporal changes related to movement of assets and people

➤ Identification of “Abnormal activities” along the Greek-Albanian border:

- Particular human flows
- Unusual movement (people and/or vehicles)
- Unofficial camps or gathering points

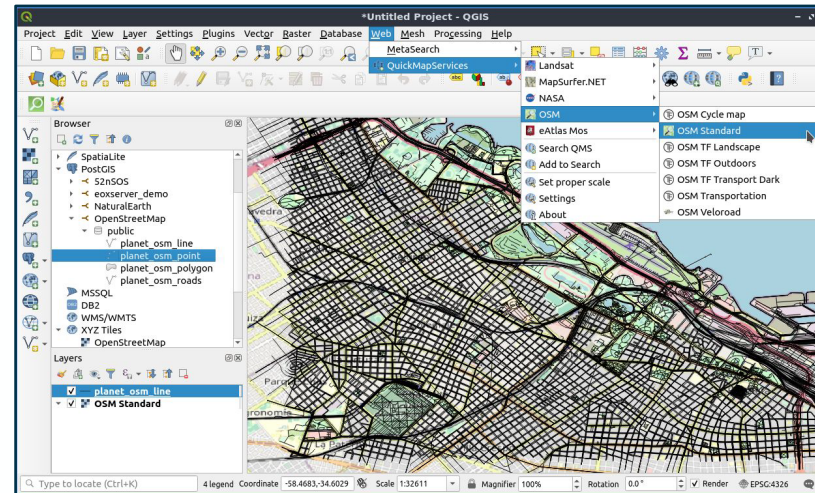

Stakeholder	INTERPOL
Objective	Implementation of change detection for identifying abnormal activities in the Albanian border, related to illegal immigration
Services and products	Service 1 + Least Cost Path analysis
Technical advancement	Computation of the potential walking routes used by the immigrants
Capacity building/training	Demonstration of the results
Added value/impact	Minimized areas of interest, precisely geolocated point of assembly, linear representations of migration routes
Outputs	Reports, spatial data, maps, satellite data

- Input data to model ease of on-foot accessibility:
 - Land Cover (CORINE supplemented by VHR Reference Mapping)
 - Road network (OpenStreetMap)
 - Elevation (SRTM)
 - Points of Interest (Border Crossing Points, Towers)

CORINE Land Cover

OpenStreetMap

Results – Least Cost Path Analysis

- Use of output from OSINT
 - Migrant behavior to model the costs to travel
 - Use of the placenames and assembly point as Origin-Destination points
- Computation of Cost surface and Least Cost path
- Use of a custom script in a GIS environment

Figure 29: Cost surface for the Hide scenario (H) for OD pairs 1 and 2

Mountainous areas have lower cost due to lower risk of being sighted

Roads have higher cost due to higher risk of being sighted

Figure 30: Least Cost Paths for the Hide Scenario for OD pairs 1 and 2 (H)

Results – Satellite Image Analysis

- 4000 points of intense changes yielded
- Manual inspection with basemap
- Identification of those with interesting pattern
- Focusing on smaller Areas Of Interest

The services proved to be effective

Adjustable approach, non dependent on geographic location and time

Quick generation of outputs

Reduced extent of initial AOI and lower cost

Excellent feedback by the users

The services met user's requirements and expectations

Some solutions were integrated with user's operational workflows

Integration of AI and Deep learning algorithms for automatic object detection and identification

More verification exercises in various scenarios for further testing of the services

The services could be enriched with the addition of data and information gathered by other intelligence disciplines

Development of digital secure environment for handling sensitive data

Development of tools for checking and ordering VHR satellite imagery data

Implementation of a Service Authentication System based on Blockchain technology

Thank you!
