TAKING THE PULSE  
OF OUR PLANET FROM SPACE

## Lead detection method from Sentinel-6 FF-SAR combined with imagery data

Samira Amraoui , Thomas Moreau , Marta Alves , Charles Pereux, Pietro Guccione, François Boy , Claire Maraldi , Nicolas Picot , Craig Donlon

27/05/2022

# Sentinel lead detection

- **Definition** : a lead is a fracture in the sea-ice
- **Challenges** :
  - Leads are very **thin** surface requiring high resolution methods
  - No prior knowledge of leads position, they always move though time due to **drifting** surface effect
- **Exploiting Sentinel mission constellation** :
  - on imagery : Sentinel-1 and Sentinel-2
  - on altimetry : Sentinel-3 and Sentinel-6

# How to detect lead on Sentinel 1 image ?

The detector has been designed by [Longépé, 2019] and adapted for Sentinel-1 SAR images

## Lead signature :

- ❖ dark areas
- ❖ relatively high backscatter background ( $\sigma_0$ )

## Methodology :

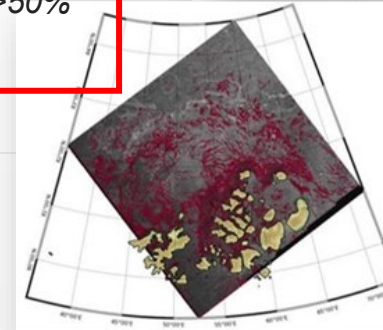

- start from EW GRDM S1-a and b data as input
- reduce the speckle noise by applying a Lee denoising filter to the  $\sigma_0$
- detect dark regions (minima points) by using a gray-scale reconstruction algorithm
- each local minima is considered a single lead and is “filled-in” up to a certain threshold (of  $\sigma_0$  and sea-ice concentration) to recreate the lineic

Original Image

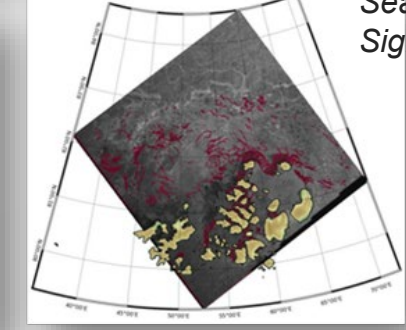

Sea ice conc. >50%  
 $\sigma_0 > 6\text{dB}$

Sea ice conc. >50%  
 $\sigma_0 > 9\text{dB}$

Sea ice conc. >70%  
 $\sigma_0 > 6\text{dB}$

Sea ice conc. >70%  
 $\sigma_0 > 9\text{dB}$

# How to detect lead on Sentinel 6 radargram ?

Without an available classification (of the backscattered waveforms) on S6, lead detection will be based on coherence theory

## Lead signature :

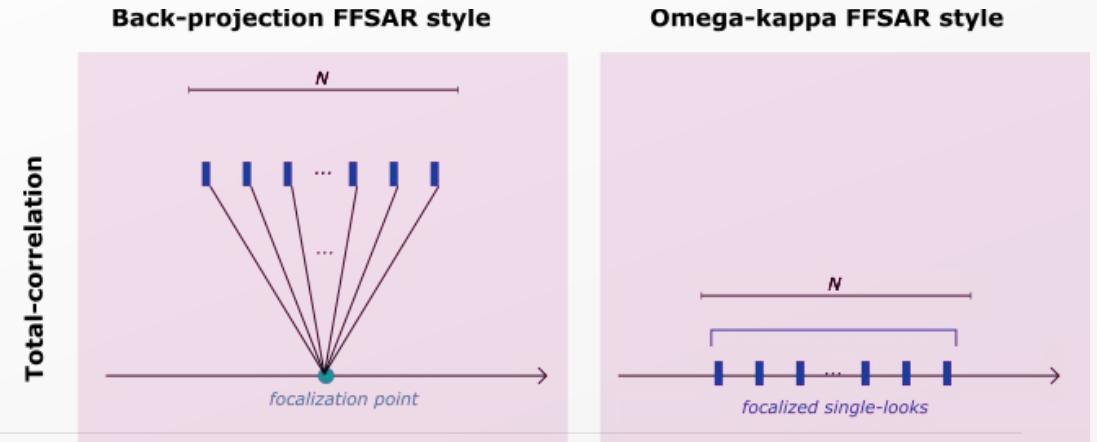

- ❖ high level of coherence (with a given threshold)
- ❖ high decorrelation time (see [Boisot, 2016])

## Methodology :

- Generate :
  - a) N focalized pulses (back-projection "style")
  - b) Generate N single-looks (omega-kappa "style")
- Compute the coherence between the N pulses [Abileah, 2017]

$$c_n(z) = \frac{\left| \sum_{k=1}^N \bar{z}_{k+n} e^{i\theta_{k+n}} \right|^2}{N \sum_{k=1}^N |\bar{z}_{k+n}|^2},$$

- Shift to the next packet of N pulses

# How to detect lead on Sentinel 6 radargram ?

Without an available classification (of the backscattered waveforms) on S6, lead detection will be based on coherence theory

## Lead signature :

- ❖ high level of coherence (with a given threshold)
- ❖ high decorrelation time (see [Boisot, 2016])

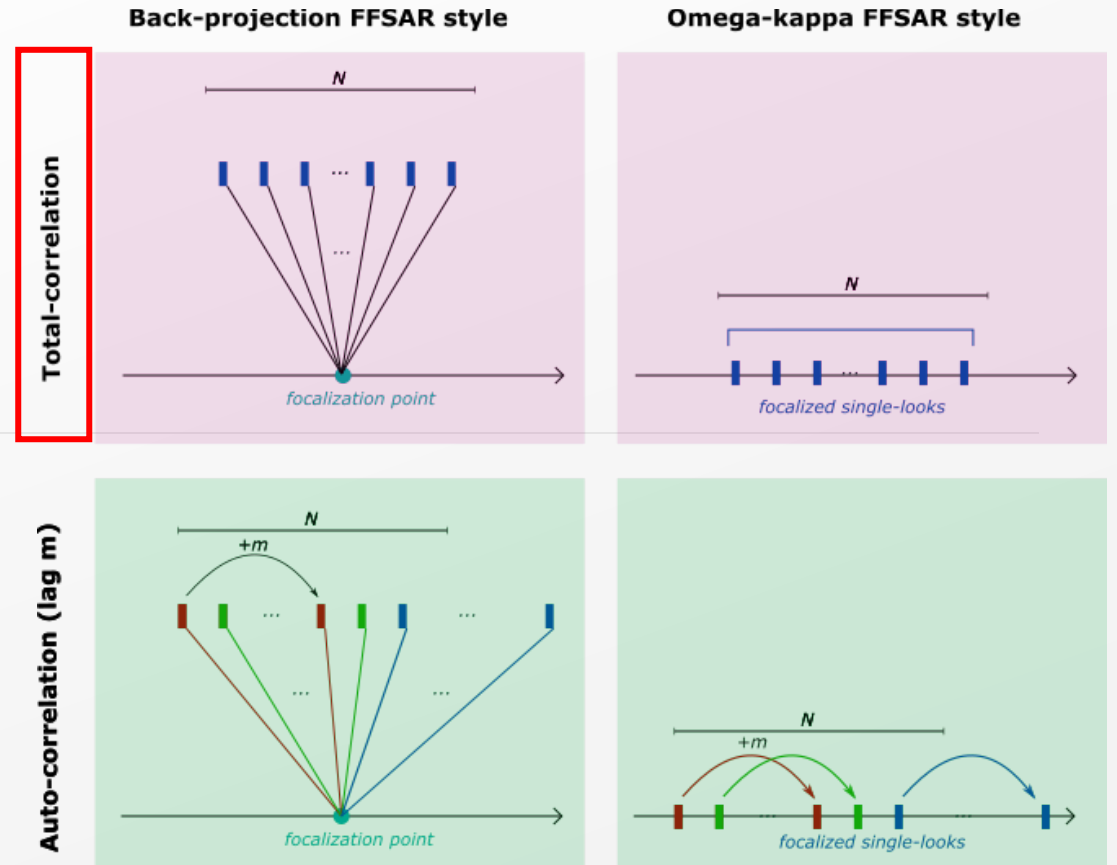

## Methodology :

  - a) N focalized pulses (back-projection "style")
  - b) Generate N single-looks (omega-kappa "style")
- Compute the coherence between the N pulses [Abileah, 2017]

$$c_n(z) = \frac{\left| \sum_{k=1}^N \bar{z}_{k+n} e^{\theta_{k+n}} \right|^2}{N \sum_{k=1}^N |\bar{z}_{k+n}|^2},$$

$$c_n(z) = \frac{\left| \sum_{k=1}^N \bar{z}_{k+n} \bar{z}_{k+n+m} e^{\theta_{k+n} - \theta_{k+n+m}} \right|^2}{\sum_{k=1}^N |\bar{z}_{k+n}|^2 \sum_{k=1}^N |\bar{z}_{k+n+m}|^2},$$

- Shift to the next packet of N pulses

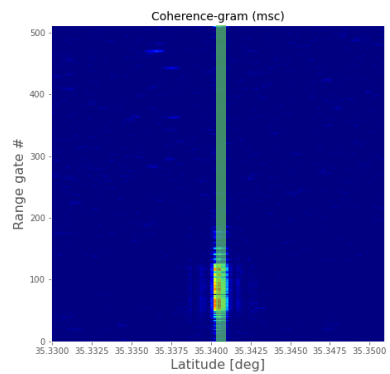

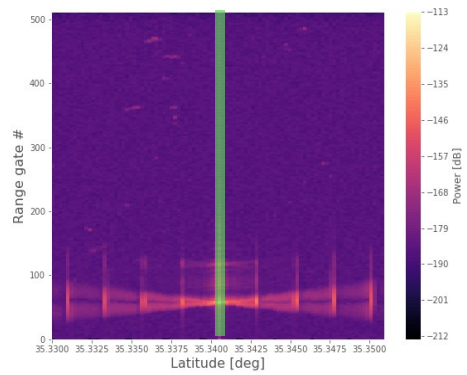

# How to detect lead on Sentinel 6 radargram ?

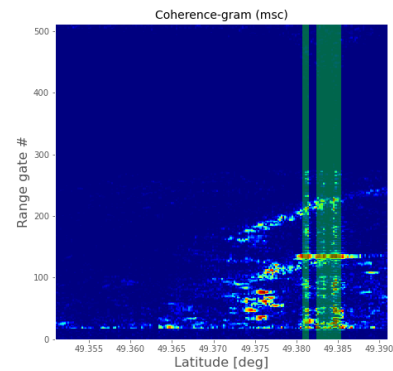

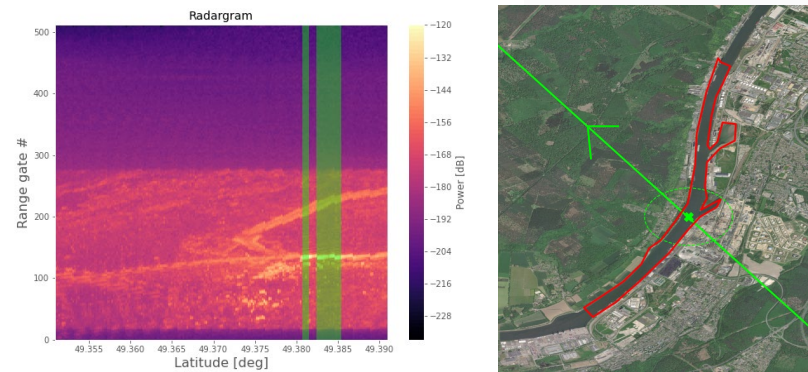

## Validation of the method

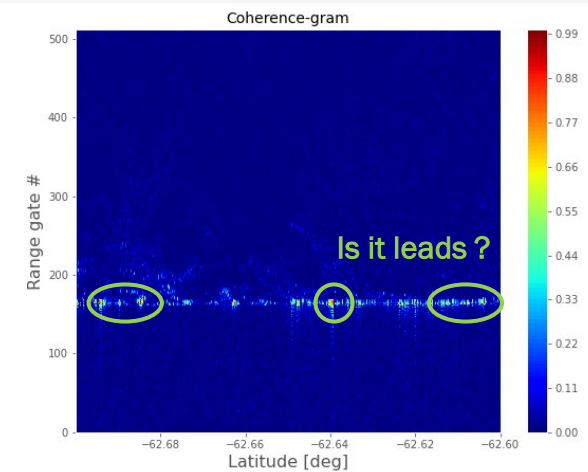

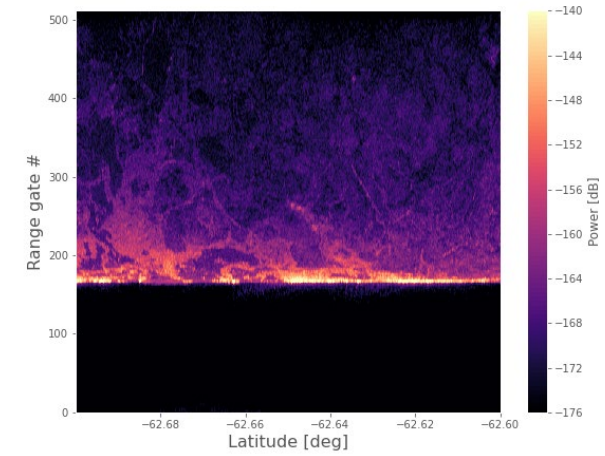

CDN1 transponder

Seine river (France)

## Application to sea-ice

# Synergy between Sentinel-1 and 6

**Step 1 : Selection** collocation points (Sentinel-1 images and Sentinel-6 FFSAR) with a time lag less than 15 minutes to avoid drift problem.

**Step 2 : Launch the lead detector** on Sentinel-1 images collocated with Sentinel-6

**Step 3 : provide two indicators :**

- ❖ the distance of S1 lead to S6 nadir
- ❖ the percentage of S1 leads inside S6 FFSAR footprint area

Three conculant examples will be studied more deeply here :

Antarctic colocation S1 and S6  
From 1st June 2021 to 1st September 2021

1213 colocations founded  
In red : S1 images  
In black : S6 tracks

S1 and S6 lead detector is not matching (rough surface)

# Problematic of the closed-burst mode

**Closed-burst mode** is present in altimetry missions like Cryosat-2 and Sentinel-3. It is very problematic for the use of fully-focused SAR lead detection, since it creates artefacts of the main signal every 100m

**Reproduce the closed-burst** by removing bursts to open-burst Sentinel-6 and compare directly the performances of the two modes on the same surface points

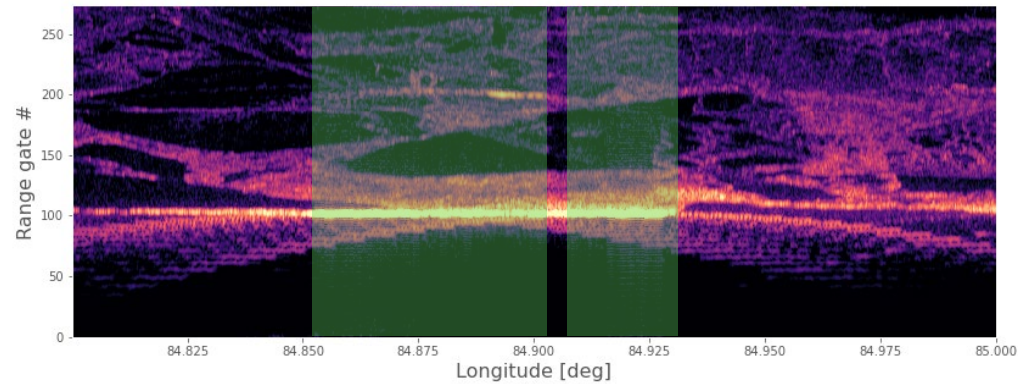

# Problematic of the closed-burst mode : Image 8A49

Open-burst mode

Omega-kappa FFSAR 500hz

Closed-burst mode

Omega-kappa FFSAR 500hz

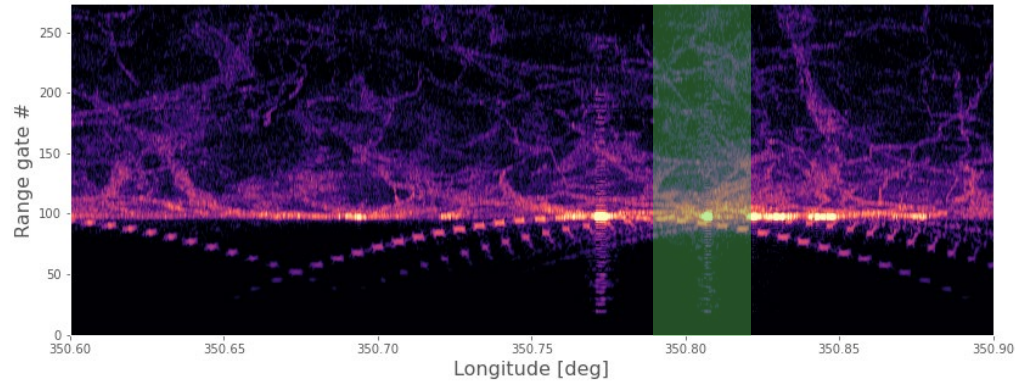

Overflow and oscillations of the coherence in closed-burst (due to replica interference)

# Problematic of the closed-burst mode : Image 5AE2

## Open-burst mode

Omega-kappa FFSAR 500hz

## Closed-burst mode

Omega-kappa FFSAR 500hz

Overflow the coherence in closed-burst (due to replica interference)

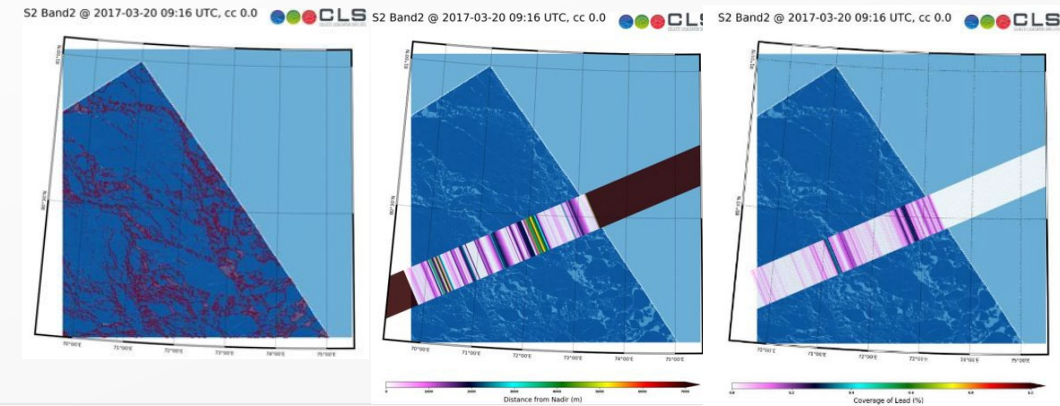

# Conclusion and perspectives 1/2 :

## Synergy SAR Imagery and SAR Altimetry:

- ❖ Various results found out about the S1-S6 synergy. It is hard to tell if S1 is the reference, given the **different resolution** of between S1 and FFSAR S6
- ❖ **Next step** : collocation S2-S6 since S2 has a resolution of 10m times 10m

## Previous results of S2 and S3 collocation

## 215 collocation points found between S2 and S6 (Arctic)

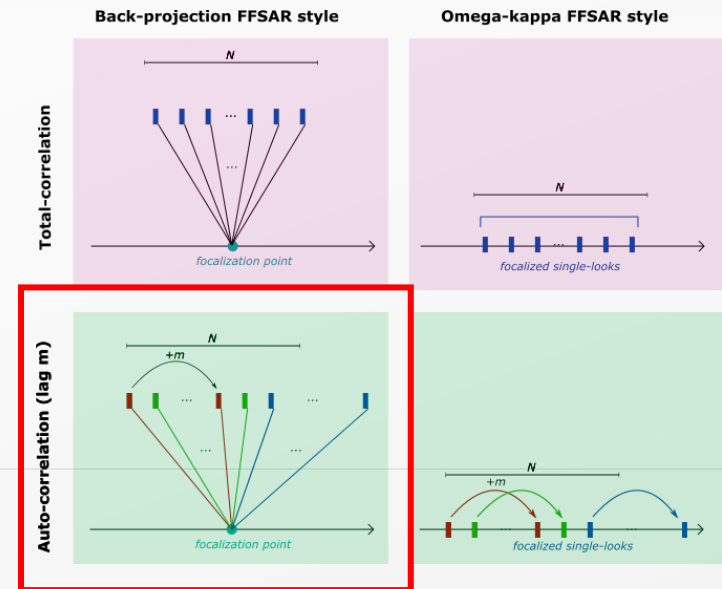

# Conclusion and perspectives 2/2:

## Closed-burst mode :

- ❖ Overflow but also a **constructive-destructive** effects due to interference
- ❖ Huge problem for the use of FFSAR on Cryosat-2, **Sentinel-3 A/B/C/D**
- ❖ Use a non-impacted method by replicas, theoretically speaking **auto-correlation of focalized pulses are not jeopardized by replicas**

Total-correlation :

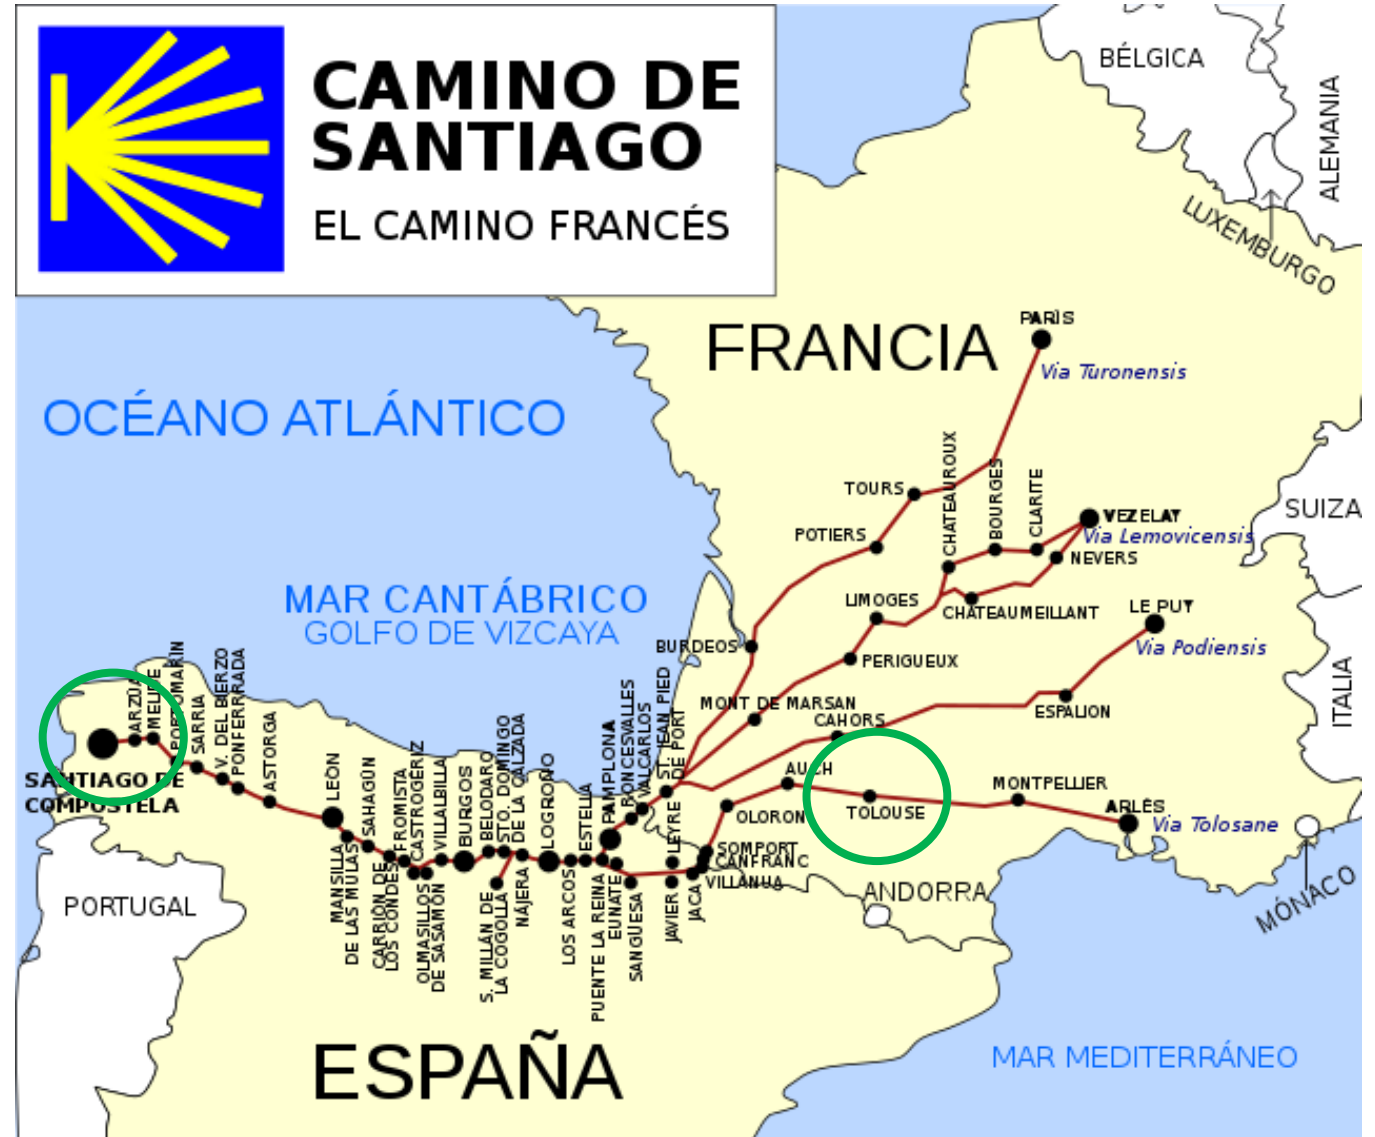

$$\sum_{n=0}^{N_b-1} \int_{-\infty}^{+\infty} \Pi\left(\frac{\eta - nBRI}{T_b}\right) \exp(-2i\pi f_d \eta) d\eta = T_b \exp(-i\pi(N_b - 1)BRI f_d) \frac{\sin(\pi N_b BRI f_d)}{\sin(\pi BRI f_d)} \text{sinc}(T_b f_d)$$

Auto-correlation (with a lag of  $\Delta\eta$ ) :

$$\sum_{n=0}^{N_b-1} \int_{-\infty}^{+\infty} \Pi\left(\frac{\eta - nBRI}{T_b}\right) \exp(-2i\pi f_d \eta) \exp(2i\pi f_d(\eta + \Delta\eta)) d\eta = N_b T_b \exp(2i\pi f_d \Delta\eta)$$

Thanks for you attention !
